ECCLES.—February 15th.—For the supply of setts, flags, kerbs, broken rubble, broken slag, granite macadam and chippings, prepared tar slag, prepared tar limestone, limestone cube chippings, gravel, cinders, castings, pitch, creosote, tar, Simpson's patent street gullies, stoneware passage gullies, stoneware pipes, bends and junctions, mortar, and channel stones, for the corporation.—Mr. Thomas S. Picton, borough surveyor, Eccles.

SURBITON.—February 15th.—For the supply of team labour, broken Guernsey granite, concrete paving flags, general stores, repairing burst and damaged water pipes, cast-iron goods, tools, smiths' work, Derbyshire limestone, tar-paving materials, house refuse removal, Norway granite kerbing, Norway granite paving setts, Kent flints, gravel, Thames ballast, scavenging, slag tarred macadam, scavengers' brooms, horse sweeping brooms, machine brooms, lubricating oils, and sludge press cloth, for the urban district council.—The Surveyor, Council Offices, Ewell-road, Surbiton.

BELFAST.—February 16th.—For the supply of earthenware sewer pipes, timber, slates, hardwood, iron castings, plumber's work, nails, iron and steel, paints, oils, glazing, mill furnishings, shovels, spades, graipes, buckets, scavenging brushes, glazed bricks, artificial flags, lime, pitch, felt, tar, sea sand, sea gravel, Lough Neagh sand, and cement, for the corporation.—Mr. Hector F. Gullan, superintendent of works, City Hall.

RAWTENSTALL.—February 17th.—For the supply of road metal, earthenware pipes, gullies, timber, pitch, creosote oil, disinfectants, Portland cement, iron castings, local stone, workmen's tools, scavenging brushes, horse-shoeing, coal and coke, for the corporation.—Borough Surveyor.

WESTMINSTER.—February 18th.—For the supply of ballast and sand, boots, bricks, brooms and brushes, carriageway and footway repairs (asphalt), carriageway repairs (macadam), carriageway repairs (granite sett pavement), carriageway repairs (wood pavement), cement and lime, disinfectants, dry-saltery, dust baskets, flags, mason's work, broken granite, granite setts, kerbs, channels, stoneware gullies, harness, horse hire and cartage, hose pipe, iron castings, petroleum spirit, painters' materials, pitch and creosote oil, plates, sheets, bolts, tree guards, retyring wheels, rubber and waterproof goods, sewerage and drainage, shovels, picks, sewer implements, edge tools, stoneware goods, street name plates, tarpaulin, tar-spraying macadam roads, timber, tool handles, and wood paving blocks, for the city council.—City Hall, Charing Cross-road, London, W.C.

STOKE-ON-TRENT.—February 20th.—For the supply of Portland cement, blue paving bricks, common bricks, sanitary pipes, gullies, macadam, chippings, pitch, creosote oil, cast ironwork, picks, shovels, general ironware, paints, oils, brooms, brushes, bath towels, dusters, ironmongery, general stores and disinfectants, for the corporation.—Borough Surveyor.

MANSFIELD.—February 22nd.—For the supply of granite, slag, tar-macadam, natural flags, kerbing, channelling, concrete flags, Portland cement, stoneware pipes, junctions, bends, timber, sewer ironwork, castings, coal, ironmongery, general stores, paints, oils, varnish, brooms, brushes, disinfectants, and harness, for the corporation.—Mr. Thos. P. Collinge, borough engineer and surveyor.

SOUTHALL-NORWOOD.—February 23rd.—For the supply of granite, lime, cement, oil, alumino-ferric, waste, press cloth, disinfectants, tools, picks, shafts, dust-bins, Kentish pit flint, hoggin, gravel, horse hire, steam rolling and scarifying, forage, coal, and coke, for the urban district council.—Mr. Reginald Brown, engineer and surveyor, Town Hall, Southall.

BATTERSEA.—February 24th.—For the supply of materials for cart and van covers, harness material, paints, special paints, enamels, painters' sundries, varnish, tools, ironmongery, granite macadam and chippings, slag tar-macadam, tarred paving material for footpaths, chippings, dust, and gas tar, York paving, Thames ballast and sand, stoneware pipes, timber, bricks, cement, lime, iron castings, iron bars, scavengers' bass brooms and circular bass brooms, disinfectants and oils, for the borough council.—Mr. W. Marcus Wilkins, town clerk.

SOUTHEND-ON-SEA.—February 24th.—For the supply of stoneware pipes, bends, flints, bricks, gravel, sand, timber, ironmongery, paints, oils, colours, cement, lime, chalk, team labour, forage, tar-paving, tar-macadam, iron castings, granite kerb, channel, broken Guernsey granite, broken granite, pitch, creosote oil, harness supplies, sundries, brooms, brushes, steel, iron, and disinfectants, for the corporation.—Mr. Ernest J. Elford, borough engineer.

HAMPTON.—February 25th.—For the supply of hand-broken granite, granite chippings, broken Kentish brown flints, Derbyshire limestone, marble tar-paving material, forage, house coal and coke, and scavengers' bass brooms, for the urban district council.—Mr. Sidney H. Chambers, surveyor, Public Offices, Hampton.

SOUTH SHIELDS.—February 27th.—For the supply of Northumberland whinstone, Fifeshire whinstone, Aberdeen and Norwegian granite, slag, granite chippings, Caithness flags, Portland cement, cement-concrete flags, cast ironwork, shovels, scavengers' leather hose, sewer boots, jackets, sanitary pipes, paints, paint oils, glass, timber, iron, horseshoe nails, cart axles, springs, tar, pitch, oils, and general stores, for the corporation.—Mr. Leslie Roseveare, borough engineer and surveyor.

MIDDLETON.—February 28th.—For the supply of macadam, setts, kerbs, flags, cement, pipes, pitch and oil, and brooms and castings, for the corporation.—Mr. Frederick Entwistle, town clerk, Town Hall, Middleton.

DERBY.—March 1st.—For the supply of bricks, cement, lime, disinfectants, earthenware, freestone, gritstone, granite, gravel, sand, limestone, pitch, tar, and slag, for the corporation.—Borough Surveyor.

MARYLEBONE.—March 1st.—For the supply of road materials, horses, harness and drivers, Portland cement, oils, stoneware sewers, ironwork for sewers, and slopping, for the borough council.—Mr. J. Paget Waddington, borough surveyor.

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. FEBRUARY 19 1915. No. 1,205.

Minutes of Proceedings.

Protection from Fire.

By [illegible] to have [illegible] objects of the [illegible] protection from fire. [illegible] substantially [illegible] opinion. One thing is certain, however—that, in spite of [illegible] stand on all the [illegible] means for preventing and minimising fire every year [illegible] and property [illegible] explosion [illegible] new industrial processes may introduce new risks, and in the second place the element of carelessness [illegible] of fire usually [illegible] in direct [illegible] second [illegible] meeting the [illegible] construction and [illegible] to fire [illegible] which was read by Mr. Whitby [illegible] meeting of the Society of Architects. Mr. Scott [illegible] a member of the British Fire Prevention Committee, he was able to add one more to the many well-deserved [illegible] has [illegible] The paper [illegible] criticism of the London Building Acts from the point of view of fire prevention, the most notable suggestion perhaps being that all floors and staircases, irrespective of the size or use of the building, should be constructed of fire-resisting material; and further, that the top floor should be [illegible] not also constructed of fire-resisting material, it would [illegible] the collapse of the roof in case of fire. Apart from the question of cost, the desirability of such an arrangement cannot be [illegible]. Mr. Scott gave some figures to show that the disparity between the cost of ordinary and fire-resisting floors, either for ordinary domestic buildings or for [illegible] first be supposed. The suggestion as to the strength of the top floor appears to us to be an excellent one, for it is [illegible] the past many fires have resulted in the total loss of the building [illegible] collapse of the roof, or one floor carrying the whole series of floors to collapse like a house of cards.

In closing his remarks in regard to matters of construction, Mr. Scott pointed out that the question of first cost must be considered in relation to the reduction in the insurance premium, and the inconvenience, loss of profit and business connection in the event of a disastrous fire. The former is a matter for the insurance company, but the latter must be estimated by the owner himself. It is worthy of note that premiums are sometimes [illegible] great importance where large and valuable stocks are kept. The concluding part of Mr. Scott's paper was concerned with the several methods that have been devised for extinguishing fires, ranging from the hand-bucket to the chemical extinguisher and automatic sprinkler. In regard to private hydrants, the author observed that in laying down an installation connection to two different mains should be made if possible. The most efficient private apparatus, however, is [illegible] reduction varying from 30 to 70 per cent. Mr. Scott stated that if a little care and attention [illegible] sprinklers are to be installed the actual construction need not be less economical. Moreover, in [illegible] installation itself. The advantages of the sprinkler are not confined to their automatic discharge when the arranged temperature is reached, but in addition they may be fitted with automatic alarm signals which give notice immediately the apparatus comes into action, and continue ringing so long as any sprinkler is in operation. Mr. Scott's paper forms a comprehensive and interesting contribution to the literature of a most important subject.

Sewage Purification and Disposal.*

The publication at the present time of a technical book, and, above all, of a book on sewage purification, indicates courage of a high degree on the part of both author and publishers. To most people it would seem that, apart from the latest developments, such as treatment by aëration and by dilution, which are intentionally omitted from the present volume, there is very little that has not already been written by one author or another about modern methods of sewage disposal. It is true that Mr. Kershaw's book forms one of the Public Health Series issued by the Cambridge University Press, and as such it certainly gives in a useful and handy form the knowledge now available in this branch of public health work. The bibliographies which are given at the end of each chapter and the quotations from American and Continental [illegible] should be very useful for reference. The various stages in the process of purification are dealt with in order, and thoroughly. The chapter on the removal of suspended matter is excellent—indeed, the [illegible] is good; but on one matter we cannot refrain from a few critical observations. It is curious to find that the correct method of constructing contact beds is only now being properly understood in many quarters. In dealing with the question of ineffective drainage

* By G. Bertram Kershaw, M.Inst.C.E., Late engineer to the Royal Commission on Sewage Disposal &c. Cambridge University Press. 1s. net.

the author suggests that "contact beds would probably give better results if the floor of each bed were formed of aërating tiles after the manner of percolating filters—this has been actually done in several instances in American practice." From this it might be assumed that this practice was first adopted in America, whereas it is now some ten years since it was introduced in connection with the large scheme of contact beds at Leicester by Mr. E. G. Mawbey, M.Inst.C.E., the borough engineer. In a paper read at a meeting of the Royal Sanitary Institute, Mr. Mawbey described these beds (The Surveyor, May 6, 1910), and was able to show that even after two years' work they had a liquid capacity of over 40 per cent of the gross capacity of the empty beds. Other engineers who have adopted the same method have had similar experience, and if all contact beds had been constructed on these lines there would have been no cause for complaints as to the loss of capacity so frequently complained of.

Again, in dealing with the treatment of brewery wastes, the author states that "contact beds are not so suitable for the treatment of brewery wastes as percolating filters." This opinion has been held by other writers, but, as we pointed out in reviewing the book on "Trade Waste Waters," by Drs. Maclean Wilson and H. T. Calvert (The Surveyor, June 13, 1913), we are acquainted with at least two cases where brewery wastes are satisfactorily treated in contact beds, and the effluent is discharged into very small streams without causing the growth of fungus or any smell whatever. Finally, in a footnote to the section dealing with the treatment of gas liquor, it is stated in reference to the treatment of the sewage of Oldbury in contact beds that percolating filters would seem to be better adapted for a sewage containing such a large quantity of wastes from a chemical works engaged in the recovery of ammonia from gas liquor, and that it is not clear why contact beds were selected. We are glad to be able to enlighten the author on this point by referring him to a report contained in Appendix IV. to the Fifth Report of the Royal Commission on Sewage Disposal, in which Mr. Colin C. Frye pointed out that triple contact filtration gave better results than triple percolating filtration when treating Oldbury sewage at the same rate per cube yard per day. We dealt with this matter some time ago (The Surveyor, May 13, 1910), and the original experiments, upon the results of which the conclusion was arrived at, were described about three years earlier (The Surveyor, July 12, 1907).

"Healthful Recreation."

Is a kinematograph entertainment "healthful recreation or exercise" within the meaning of the Baths and Washhouses Act, 1878? This was the conundrum which Mr. Justice Joyce had to answer in the case of *Attorney General* v. *Shoreditch Borough Council and Wright*. It may be remembered that the matter came before Mr. Justice Eve some months ago on motion for an interim injunction to prevent the Hoxton Baths from being used for such entertainments pending the trial of the action, and that that learned judge, answering the question in the affirmative, refused the application. Mr. Justice Joyce, however, came to the opposite conclusion. The council had let the baths for the winter season 1913-14 to the defendant Wright as a kinematograph theatre, and the action was brought at the relation of the Hoxton (Cinema), Limited. Sec. 5 of the Baths and Washhouses Act, 1878, under which the council purported to act, gives the urban authority power between November and March (both inclusive) to close a swimming bath and to establish therein a gymnasium, or such other means of healthful recreation as they shall think fit, or to allow it to be used as an empty building for such purposes of healthful recreation or exercise as they shall think fit. There was a proviso at the end of the section absolutely prohibiting the use of a swimming bath for music or dancing. This, however, was repealed by the Baths and Washhouses Act, 1899, which provides that before a bath is used for music or dancing the authority shall obtain a licence for the purpose, that no portion of the licensed premises shall be let otherwise than occasionally, and that no money shall be taken at the doors. Mr. Justice Joyce, in arriving at his decision, considered not only sec. 5 of the Act of 1878, but also the three following sections, as throwing light upon the intention of the Legislature. Sec. 6 empowers the authority to make by-laws for the use of the baths when used for any of the purposes mentioned in sec. 5; sec. 7 authorises them to appoint officers and servants for the management and superintendence of any gymnasium or other means of recreation; and under sec. 8 they can make reasonable charges for the use of the gymnasium, &c., or for the use of a covered swimming bath as an empty room.

Looking at the words "healthful recreation" entirely isolated from their context, there is, no doubt, room for difference of opinion as to whether a kinematograph show comes within their scope. It may be argued that anything which by entertaining and interesting the mind tends to recreate the tired worker is healthful recreation, while, on the other hand, it may be said that recreation involving a sedentary position in a crowded room, and a certain amount of eye-strain, however entertaining, cannot be conducive to true hygiene. But, having regard to the scope and phraseology of the Act, we think Mr. Justice Joyce's decision will be generally accepted as satisfactory. He held that in letting the baths as they had done the council were not (in the words of the Act) "allowing any covered or open swimming bath to be used as an empty building for purposes of healthful recreation or exercise," and he accordingly granted an injunction restraining the council from letting, and the defendant Wright, their tenant, from using, the baths for kinematograph entertainments. A minor point in which the decision was also adverse to the council was that, although they had obtained a licence for the use of the bath for the incidental music, the letting was "otherwise than occasionally," and money was taken at the doors—in both respects contravening the conditions laid down by the Act of 1899. The main interest of the case, however, centres in the interpretation of the term "healthful recreation."

A Bethnal Green Housing Scheme.

Under pressure from the Local Government Board the Housing Committee of the London County Council have formulated a housing scheme for Bethnal Green, in what is known as the Brady-street area. The order of the board is made under Part II. of the Housing of the Working Classes Act, 1890, and the Housing Committee in their report submit an estimate of the cost of clearing the area amounting to £53,000, £50,000 being assigned for the acquisition of property, and £3,000 for the construction of roads. The result was only reached after a good deal of correspondence with the Local Government Board, and from this it would appear that the London County Council made out a strong case for postponing the scheme to a future period when circumstances will, peradventure, be more favourable than at present for such projects. The council insisted, with much cogency, as it seems to us, that in the present state of the law the clearing of slum areas is a very costly process. It is, in fact, a process in which the factors of

[illegible] questions and evidence are [illegible] to evidence. The [illegible] falls on the [illegible] ratepayers, and the [illegible] falls on liberal measure to the [illegible] ing Committee, in defending their position, pointed out that authoritative Ministerial statements had been made indicating the form which an amended measure should take. Property taken for *inter alia*, [illegible] these statements, to be assessed at a [illegible] by a [illegible] Judicial Commissioners, and by a simplified process. Both [illegible] of course, unjustly treated, and there is something to be said for the view that if the [illegible] the [illegible] property is to be reduced by legislation it would not be desirable to pursue such projects under the existing system. However, [illegible] and under the order made by the Local Government Board the scheme will be proceeded with at an initial cost of £53,000. That the area [illegible] is clear from the extensive [illegible] permit of dispute. It consists of 20½ acres, and the clearance will involve the displacement of 1,121 persons. The Housing Committee, following the policy they pursued in the Tabard-street scheme, propose to provide accommodation for 500 persons, not a [illegible] displaced, or even [illegible] the [illegible] dwellings would let if erected. The difficulties of dealing with the improvement of housing in London are not few or inconsiderable, yet in spite of this the London County Council has rendered excellent service in the clearance of insanitary areas and the provision of habitable dwellings. It is not generally known that by means of their various schemes they have provided accommodation in [illegible] for a much [illegible] than those who have displaced [illegible] them.

* * *

Tar-spraying and Negligence.

The case of *Hoare v. [illegible] County Council* and *Fothergill Brothers*, a report of which appears elsewhere in this issue, raised some questions of special interest to municipal engineers. The [illegible] for personal injuries sustained in consequence of her being thrown out of a trap owing to the slipperiness of a road alleged to have been caused through negligence in tar-spraying. In the [illegible] specification appears to have been attached to the general directions and specifications as to the [illegible] Road Board. The fact that the work had been carried out substantially in accordance with this specification appears to have influenced the [illegible] and properly so, that there was no negligence up to the time of the completion of the work. It must not be assumed, however, from this that the specification is conclusive on the question of negligence. No doubt any tribunal or jury would attach to it the great weight which it deserves, and the fact that work has been executed in accordance with it would be strong evidence of the absence of negligence. The specification, however, is only one matter to be considered, and it is conceivable that other circumstances might in some future case produce a finding of negligence although the specification had been substantially followed. The negligence found in the case under consideration was the insufficient sprinkling of loose sand or gravel on the surface after the tar had dried and before the public were invited to use the road. The question of law then arose as to whether this neglect amounted to misfeasance, so as to bring the case within the well known rule that a highway authority are only liable for acts of misfeasance and not for mere non-feasance. The County Court Judge said that there had been misfeasance, and he therefore gave judgment for the plaintiff. The question is one of great interest and [illegible] the authorities. We observe, however, that a [illegible] appeal.

* * *

Concrete Calculations.

In another column will be found an article from the pen of Prof. P. W. [illegible] Assoc.M.Inst.C.E., Professor of Civil Engineering, University College, Cork, in which the desirability of the individual engineer keeping a systematic record of tests of samples of cement and concrete is discussed. The literature of concrete is very prolific, and yet there remains a certain vagueness about much of the information available. Prof. Alexander [illegible] to [illegible] the main factors governing the strength of concrete, to show the lines along which they can be [illegible] and controlled, and to indicate how results may be effected by the shape and dimensions of the mass, as well as by the method of applying the stress. Much of the difficulty of comparison arises from the fact that the [illegible] rials that may be used for a concrete aggregate is almost infinite, and that each has its own peculiarities. It is impossible, therefore, for the [illegible] to [illegible] derived from another concrete made in a different way and of different materials, and it is accordingly incumbent upon him to prepare his own working stress values. The detailed figures given by Prof. Alexander [illegible] interest, as illustrating the apparent superiority of small cubes [illegible] It must be remembered that the greater density obtained in the smaller ones, but the bulk [illegible] by the platens of the machine. As has been suggested by other observers, it is probable that the best test would be that in which three cubes were placed together to form a prism and subjected to axial compression, the crushing load on the middle cube being taken at the compressive strength.

* * *

Superannuation Again.

We are constantly receiving new evidences of the anxious interest which municipal engineers throughout the country take in the agitation to secure adequate superannuation allowances for municipal officials. As an example we may refer to the letter which appears in another column, and a written question [illegible] on the resignation of Mr. E. Purnell Hooley for the purpose [illegible] as Captain in the Sherwood Foresters. In that article we mentioned that a suggestion had been made for the appointment of a *locum tenens*, or a temporary consultant, but that this course had not commended itself to the council. We further expressed our surprise that, having regard to Mr. Hooley's twenty-five years' service, the question [illegible] In this connection a correspondent, "R.D.C. Surveyor," points out that even if superannuation should be granted it will be as an act of grace. Our views on the general question are well known, and it is sufficient for us to say here that we cordially sympathise with the case presented by our correspondent. As he observes, the case is indeed an unanswerable one, and the situation will not be met until the municipal officer becomes absolutely entitled to an adequate [illegible] ing allowance under a compulsory Act of Parliament. The dangers of an optional or adoptive measure are so well known, especially to those who have experience of the ways of small authorities, that compulsion is essential. Only, as "R.D.C. Surveyor" says, let it be soon!

* *

Calculations on Concrete.

By Professor C. W. L. ALEXANDER, Associate M.I.C.E.I.

During the past fifteen years engineering papers have published more figures and calculations relating to cement and concrete than they have given about all other materials and structures put together. Every engineer knows, or fancies he knows, something about concrete. Its use has spread to all kinds of work. These two facts account largely for the attention paid to it in the Press.

Is the average engineer in a position, after these years of super-arithmetic, to turn to a satisfactory table of physical properties and unit strengths when he wishes to get out a design? Is he able to say of cement and concrete, as he would of a certain quality of steel, that its safe stresses in tension, compression and shear, under the conditions given, are so and so? Possibly some engineers, who have standardised their methods and rules, while regularly keeping definite records of tests of samples of cement and concrete, may find themselves in this happy position. But these are few. The writer thinks he is stating a generally acknowledged fact when he says that there is a lamentable amount of confusion in regard to the strength of concrete. Engineers are bewildered by the mass of figures which have appeared, and which, in many cases, vary by several hundred per cent. They want to know what stresses will be safe in a given structure for concrete made according to their specification from materials about whose qualities they have more or less information.

But no statistics are available to give them their requirements, and they must perforce accept some other person's data, without knowing in the least whether or not his materials, &c., are the same. This is the usual procedure, and it is clearly not satisfactory.

It is not the writer's aim to publish any new set of figures to set at rest these troubles, for this is an impossible task. His object is to point out once more the main factors governing the strength of concrete, to show the lines along which these may be measured and controlled, to explain, very briefly, how figures relating to strengths are to be handled, and to indicate how they are affected by the shape and dimensions of the mass, as well as by the method of applying the stress.

Cement testing has been discussed *ad nauseam*, and the only remark one would make is to emphasise the extreme importance of fine grinding and high mortar strength.

The cleanness of the sand is an old topic, but is its importance appreciated? Let it be remembered that the sand is a link between the stone and the cement. If that link is weak, owing to the sand being of a friable nature, or being coated with a film of organic or earthy matter, then the concrete is certain to be of inferior character. Further, a graded sand is essential for dense work.

Much has been written about the large aggregate. The best for this is a clean, hard, well-graded gravel.

The proportions of sand and gravel ought to be regularly determined by (1) the sizes of the particles, (2) the proportion of voids; a record of the amounts passing one and being caught on another standard sieve should be kept, and cubes regularly cast from batches of concrete mixed to stipulated proportions—say, one, three and twelve months. If engineers did this with the materials in their own neighbourhood—and with a set of simple moulds this is a matter of little trouble—they would be able to co-ordinate the data relating to the cement, sand and stone, on one hand, and the finished concrete on the other. There is no other way. It is not practical or sensible to accept figures for a concrete which is made in a way and of materials which are dissimilar to those used by the designer. Hence each engineer ought to prepare his own working stress values. He then knows what he has to rely upon, and he is able to vary or to adjust his ingredients according to the conditions and to the qualities of the materials. Economy cannot be attained otherwise, and it is well to remember that economy includes both reduction in weight and in time required for the execution of the job.

But what limits are to be placed on the extent to which figures obtained from tests of small samples are employed? For example, if a 4-in. cube of concrete stands 1,600 lb. per square at the age of one month, will a similar quality in the compression area of a T beam of a floor bear the same stress? It is safe to say the two will hardly ever bear the same. Tests of specimens, moulded as they are for laboratory purposes, are in the strictest sense only comparative.

They show that a concrete standing 1,600 lb. per square inch is pretty accurately twice as strong as another standing 1,000 lb. per square inch, when the test specimens are identical in dimensions. But a 4-in. cube between the platens of a testing machine is frictionally restrained from bursting—and hence strengthened—and generally will exhibit greater unit strength than a similar mass will show in the body of a floor slab. The engineer bears this in mind when he takes a factor of safety, and is not so foolish as to cherish the idea that unit area in either case is under the same conditions and capable of sustaining similar stresses. It follows, too, that the results obtained from cubes of different size will not give the same unit strengths. If one goes in for systematic testing he must always use a cube or a briquette of the same size. The necessity for this is shown by the figures appended. The contact between the concrete and the machine should be true. This requires properly made moulds, and in compression tests a spherical seat, in case the opposing faces are not truly parallel. It is best to put the concrete directly in contact with the iron platen, for the effect of lead, wood, or plaster-of-paris bedding is quite uncertain.

When these matters have been duly appreciated, one further needs to bear in mind how easy it is to get a stress 100 per cent above the average by a slight eccentricity in the loading. For example, if the load on a column is not axial, the compressive stress on the side carrying the resultant thrust must sustain an unfair proportion. If the nature of the structure is such that cases of this character are likely to occur, allowance must be made in choosing one's working stresses. One gets the necessity for this impressed upon him in testing. If a cube of concrete is inserted so as to bear more on one corner than on the remainder, failure at a much smaller load always results. Should someone send in a cube cast in a bad mould, with a convex or concave face, a similar effect is produced.

It will be seen that, to interpret figures intelligently, one must apportion due weight to each, and that a satisfactory interpretation is only possible when all the contributory factors have been arithmetically measured and recorded.

The writer now submits a few figures which may be of interest to the readers of this paper.

Concrete made December 31, 1913, at University College, Cork.

AGGREGATE.

Whinstone Chippings [from Killeady, Co. Cork —

Size—Over ¾ in., under 1 in.	...	30·4	per cent.
,, ¾ ,, ½		26	,,
,, ½ ,, ¼	...	16·6	,,
,, ¼ ,, ⅛		20·5	,,
,, ⅛ ,, ,,		6·5	,,

Weight—88 lb. per cubic foot.

Voids—45 per cent.

SAND.

A granite sand from Co. Wicklow —

Size—98·5 per cent passed 50 × 50 sieve and practically all was retained on a 76 × 76 sieve.

Weight—Dry, 86 lb. per cubic foot.
Wet, 107½ ,,

(This means that, taking a cubic foot measure full of water, one must pour in 107½ lb. of sand to bring the sand level with the rim, the water meanwhile overflowing.)

Voids—Dry, 46½ per cent.
Wet, 27 ,,

CEMENT.

Messrs. Martin Earle's.

This had been stored for some little time in a

wooden box, and had been slightly affected by damp. It was all put through a ½-in. sieve.

Weight.—When filled quite loose into a bucket it weighed 75 lb. per cubic foot.

Tests on samples of another very good stone of somewhat gave the following interesting figures:—

Dry loose volume	64 lb. per cubic foot
,, well-shaken volume	80 ,,
Wet volume	104 ,,
Voids (say)	38½ per cent.

When mixed with 20 per cent water, rather a large proportion (104 lb. cement + 26 lb. water = 130 lb.), this gave a block whose weight next day was 126 lb. per cubic foot. Hence the finished volume of the mass is about 77 per cent of the light dry volume, and the finished weight of the mass about 121 per cent of the weight of the cement used.

Strength of cement used in concrete.—Six British standard briquettes of cement paste with 22 per cent water and 6 of one of cement mortar (1 cement, 3 Leighton Buzzard sand by weight) gave the following figures:—

Cement Paste.

7 days.	28 days.	6 months.
515	660	730
525	640	635
Average 520	650	683

Cement Mortar.—

7 days.	28 days.	6 months.
150	260	230
160	300	275
Average 155	280	253

The balance of the writer's moulds were not available, else he would have made more specimens.

MIXING CONCRETE.

No attempt was made to proportion the concrete with regard to size of and the voids in the stone, sand and cement. A mixture of 1 : 2 : 4 was made:—

Stone	7·50	cub. ft.	1·00
Sand	3·75	,,	3·25
Cement	1·87	,,	140 lb.
Total, dry	13·125	,,	112·25 ,,
Water	1·71	,,	10·87 ,,
Total, wet			123·00

The above 13½ cub. ft. loose volume of the several constituents, when mixed with 9½ per cent. by weight of water, making a medium concrete and filled into moulds, made 8·15 cub. ft. of concrete as follows:—

6 6 in. × 6 in. briquettes	0·013	cub. ft. each	= 2·58 cub. ft.
4 10 in. × 6 in. × 6 in. prisms	0·833	,,	= 3·33 ,,
17 6 in. × 6 in. × 6 in. cubes	0·125	,,	= 2·12 ,,
6 3·16 in. × 3·16 in. × 3·16 in. cubes	0·018	,,	= 0·11 ,,
6 1 in. × 1 in. briquettes	0·002	,,	= 0·01 ,,
			8·15 ,,

The weight of the dry materials, plus water, was 1,230 lb. This would give 150 lb. per cubic foot (138 lb. of which would be due to stone, sand and cement). But certain amounts of the water get lost in various ways, and the actual weight at one month averaged probably about 144½ lb. per cubic foot. The concrete specimens were removed a week later from the moulds and placed out in the open. The writer ought to explain that he has several special moulds for concrete work.

(*a*) Large steel briquette moulds, similar in shape to those for British standard cement briquettes, but giving an area at the neck of 6 in. by 6 in.

(*b*) Steel column moulds, 40 in. by 6 in. by 6 in., to give specimens for column, beam, and shear tests.

(*c*) Teak cube moulds, 6 in. by 6 in. by 6 in. These are made in combinations of three, one or two sets being sent out to a job, to take three or six castings of the concrete as it goes into, say, a floor.

(*d*) Steel cube moulds, 3·16 in. by 3·16 in. by 3·16 in. These are the Cork standard moulds for cement paste and cement mortar tests, the face of the cube being exactly 10 sq. in. in area, thus facilitating calculations. The writer finds this a very good size of cube.

The subsequent weights and strengths were obtained as follows:—

Weights.

	1 month. lb.	6 months. lb.	12 months. lb.
6 in. × 6 in. × 6 in. cubes	61·75	62·50	62·75
			62·25
12 in. × 6 in. × 6 in. prisms	117·25	117·	118·75
6 in. × 6 in. × 6 in. cubes	18·14	18·84	18·56
	18·88	18·81	18·50
	18·00	18·16	18·44
3·16 in. × 3·16 in. × 3·16 in. cubes	2·72	2·81	2·78
	2·75	2·75	2·75

These gave [illegible] cubic foot at twelve months:—

[illegible]	144 lb.
[illegible]	148 ,,
Small [illegible]	153 ,,

The weights of the prisms are not included, as their exact volume was not determined. It is clear, however, that the larger specimens are less dense than the smaller ones, a fact which must influence the strengths. The weights of the small cubes are very high, due no doubt to their receiving more thorough ramming.

Notice that the specimens show an increase in weight at twelve months over that at the month of some 1¼ per cent. For the month immediately preceding the final tests, the balmy air of Cork was moistened to the tune of 10¾ in. of rainfall, so that the increase in weight is explicable.

Strength [illegible]

	1 month.	6 months.	12 months.
Beams—36 in. × 6 in. × 6 in.			
central load	900	1,200	1,670
Shear [illegible]			
6 in. section	*5,400	22,200	25,800
	*4,850	19,500	24,350
Briquettes [illegible]			
	5,050	7,500	7,950
			8,250
1 in. × 1 in. [illegible]	225	380	440
	190	370	450
Cubes [illegible]			
6 in. × 6 in.	41,850	74,150	101,700
	43,500	73,400	105,000
3·16 in. × 3·16 in.	15,650	24,000	38,100
	16,000	†19,900	36,000

[illegible] below.
† [illegible]

Ultimate Stresses in lb. per square inch.—Stated in round numbers, and inserting approximate figures for the tests noted as unsatisfactory above, these results may be stated as follows:—

Modulus of rupture.	Shear.	Tension. Large briq.	Tension. Small briq.	Compression. Large cube.	Compression. Small cube.
1 months	225 (160)	140	210	1,200	1,660
3 months	350	230	340	2,050	2,490
12 months	420	450	225	2,900	3,780

The absolute magnitudes of these figures are not of any great significance, but their relative values are very interesting. The writer thinks that shearing tests have been given too little attention, and, having now the means of making a thoroughly satisfactory shearing test of a 6-in. by 6-in. section of concrete, he hopes to obtain figures of interest on other mixtures. It is unfortunate that the value of the shear strength at the month can only be surmised.

The so-called "modulus of rupture," as in the case of all non-isotropic bodies, does not possess any real theoretical basis, but it is a useful rough way of effecting comparisons in the case of beams and slabs.

The disparity in the unit strengths in tension between the large and the small specimens is evidence of the direct influence of the dimensions of the test piece and the way in which the load reaches a mass of concrete.

It has been shown by Prof. Coker that the maximum stress intensity in a 1-in. by 1-in. briquette of cement is 1·75 times the average. From the above figures one is led to think that the maximum stress in the large briquettes is from 2½ times (at one month) to 3½ times (at twelve months) the average stress intensity. This shows that tensile tests on large specimens need careful handling and interpretation.

The superiority of the small cubes over the larger

ones may be accounted for to some extent by the greater density obtained in the smaller ones, but the bulk of the difference is unquestionably due to the greater effect of the frictional restraint exercised by the platens of the machine. As has been suggested by other observers, it is probable that the best test would be that in which three cubes were placed together to form a prism and subjected to axial compression, the crushing load on the middle cube being taken at the compressive strength.

As already stated, these figures are given mainly to show the effect of altering the dimensions of the test specimens and to enable a comparison to be made between the ultimate strengths in flexure, shear, tension, and compression. Possibly the other figures relating to the cement, sand and stone may also be of interest. They all indicate the importance of measuring and recording all such particulars if one is ever to be able to prepare a concrete to any stated requirements.

LONDON WORKING-CLASS DWELLINGS.

COUNTY COUNCIL HOUSING MANAGER'S REPORT.

In a memorandum which appears in the annual report of the London County Council for 1913 (Part III.—Public Health), Mr. S. G. Burgess, the housing manager, states that the new buildings opened and completed by the council between April 1, 1913 and March 31, 1914, comprised 236 cottages, providing accommodation for 1,777 persons. Ten sheds and eight shops were also provided, and two three-room cottage flats were converted to two two-room cottage flats. Up to March 31, 1914, a total of 6,420 tenements in block dwellings, and 3,326 cottages, or a total of 9,746 lettings, containing 27,949 rooms, and 1,874 cubicles in lodging-houses, affording accommodation altogether for 57,362 persons, had been provided and opened by the council. The gross rent receivable for the year 1912-13 was £218,925 17s. 10d., and for the year 1913-14, £226,294 11s. 3d., being an increase of £7,368 13s. 5d.

The financial result of the year's working of all dwellings in occupation, after providing for interest and sinking fund charges on the capital expended, is a surplus of £13,623 6s. 6d., which, after adding interest on cash balances (£1,012 5s. 2d.) and the difference between totals of debit charges on cash and stock basis (£3,673 17s. 9d.), gives a total nett surplus of £18,309 9s. 5d., or 8·06 per cent of £227,100 13s. 9d., the gross rental for the year. The interest and sinking fund charges amount to 49·00 per cent of the gross rental. The sinking fund, which will redeem the capital expended on land and buildings within a period of 60 years, has been increased during the year by £17,353 14s. 11d., and the total sum now set aside in this fund in respect of dwellings in occupation amounts to £234,656 13s. The expenditure for the management of the estates, including repairs, rates and taxes, water, lighting, &c., amounts to 39·32 per cent of the gross rental. During the year the sum of £22,972 was transferred to the repairs and renewals account, the unspent accumulations on which, with the interest earned during the year (£4,978 3s. 6d.), now amount to £64,000 2s. 10d. The total addition to the fund was 10·90 of the gross rental.

The loss of rent by empties (including the amounts set aside for the opening of the new buildings, 236 lettings) is equivalent to 3·23 per cent of the gross rental.

A sum of £23,934 4s. 8d. (10·54 per cent of the gross rental) was spent in repairs to the buildings during the year. These repairs include external painting at thirty blocks of tenements and 612 cottages and the entrance doors only, whitening the soffits and cleaning or painting walls of 140 staircases, comb graining and varnishing the woodwork of 1,733 tenements and cottages, and cleansing repairs at 7,191 tenements and cottages. The whole of these repairs were executed by direct labour employed in the housing department.

Institute of Sanitary Engineers.—At a meeting of this body, to be held at Caxton Hall, Westminster, on Wednesday, March 3rd, Mr. G. Bertram Kershaw, M.Am.Soc.C.E., M.Inst.C.E., late engineer to the Royal Commission on Sewage Disposal, will present a paper entitled "Sanitation in the Bermudas: The Drainage of Hamilton, Bermuda." The chair will be taken by Colonel Harland, R.E., C.B.

DANGERS OF TAR-SPRAYED ROADS.

DAMAGES AGAINST DEVON COUNTY COUNCIL.

An important judgment affecting the now almost universal use of tar-spray upon public highways was delivered by Judge Lush Wilson, K.C., at Newton Abbot (Devon) County Court on Friday last. The plaintiff was Mrs. Edith E. Warren, of the Gastwycke Hotel, North Tawton, who claimed £50 from the Devon County Council and Messrs. Fothergill Brothers, Limited, of Exeter, for damages in consequence of alleged personal injuries sustained by being thrown out of a trap, due, it was alleged for the plaintiff, to the defendants' negligence in tar-painting a part of the road between Newton Abbot and Teignmouth. At the previous hearing evidence was given that the tar was spread upon a hill having a stiff gradient, and that plaintiff had to have medical attendance for a considerable time after the accident. Some stone or gravel had been placed upon the tar, but it was alleged that this was insufficient to prevent horses slipping, the gravel being too coarse for the purpose. The road surveyor's opinion was that the road was left in a condition suitable for traffic. Mr. J. H. Hutchings appeared for the plaintiff, and Mr. M. J. McGahey for the defendants.

Giving his judgment, his Honour said it was alleged that the road was rendered dangerous. It was proved that the road was more or less hilly, and in June or July the contractors were laying down tar. In accordance with their usual custom, they had tarred half the road on one side. There was a conflict of evidence whether the tar was spread in a proper manner. It was alleged that insufficient chippings were spread, and that too much tar had been spread. Although in one technical matter, the size of some of the chippings used, there was a departure from the general directions and specifications, the work was substantially carried out in accordance with the general directions of the Road Board. He did not find negligence up to the point of the completion of the work done by the defendants. Subsequently witnesses showed that the road was slippery and dangerous, while expert witnesses told him that the work was well done. Sand or gravel had been thrown over the surface of certain hilly parts. He was of opinion that on July 3, 1914, the surface of the hill and of other parts of the road in question was in a slippery and dangerous condition for the use of the public, and such a condition would have been avoided if the defendants had performed an operation of sprinkling sufficient sand or gravel on the tar after it had sufficiently dried, and before they invited the public to use the road. It was clear that no action of this nature could lie against a road authority for what was known as nonfeasance; it must be proved that it amounted to misfeasance. The Judge said he had come to the conclusion that where a road authority altered a highway, and injury was occasioned to an individual by such alteration, the breach of duty on the part of the authority was misfeasance. He should therefore give judgment for the plaintiff for £40.

Mr. McGahey thought this was clearly a judgment against the county council. His Honour had held that the contractors finished their work, and left the road in a proper condition.

The Judge said that, so far as the specifications of the Road Board were concerned, the work was carried out properly. Before the road could be made safe, and the public invited on it, sand should have been sprinkled so as to provide a foothold for horses.

Mr. Hutchings said he was content to take judgment against the county council.

By consent his Honour then altered his judgment as only against the Devon County Council. Costs were granted on Scale C.

A stay of execution was granted for fourteen days.

Public Authorities and Enemy Firms.—From a report of a committee of the London County Council specially appointed to investigate the question, it appears that there are no fewer than twenty-eight alien enemy firms to whom the London County Council has been in the habit of giving orders. These firms have now been placed on the council's black list of firms from whom goods shall not be obtained. A correspondent asks whether the names of these firms cannot be made public. Such a course, he suggests, would not only be generally informing, but render a special service to those municipal and other public authorities who have this question under consideration.

London Street Pavings.

METROPOLITAN COMMITTEE'S TWELFTH ANNUAL REPORT.

The Metropolitan Paving Committee, of which Mr. Vigo G. Morton is chairman, have issued their twelfth annual report relative to the paving works carried out in the County of London by various local authorities, compiled from information which has been furnished by the engineers to the various authorities concerned. The committee was formed as the result of a conference of representatives of the metropolitan borough councils held at the Westminster City Hall on January 8, 1903, for the purpose of considering the general question of materials and methods for the streets of London.

The information furnished in the returns on which this report is based relates to practically all the best-known descriptions of paving, the method of laying, the period the paving has lasted, cost of laying, [illegible] and other details.

The chief features of the year's return may be correctly summarised as follows:—

Description of Pavers Laid.—The returns received by the committee are noteworthy for the variety of the kinds of paving laid down during the year under review. Practically every kind of paving has been used, some in large quantities. As in the past year, creosoted yellow deal supplies the largest quantities. In Fulham and Hammersmith in particular very large areas of bituminous macadam were laid down, and in Hampstead and St. Marylebone a number of streets were treated with tar-slag macadam. Large areas of main roads in Hammersmith and Wandsworth were laid with creosoted deal, while in Woolwich a large area of Durax granite cubes is the predominant feature. Sectional Jarrah, Aberdeen granite setts, rock asphalt, Lithofalt blocks, and varieties of asphalt macadam were also used in considerable quantities in different boroughs. Several miles of roads, especially in the outer boroughs, such as Wandsworth, have been tar-sprayed.

Foundations.—The tendency appears to be to increase the thickness of concrete foundation, owing, doubtless, to the altered conditions of the traffic in London streets. Various thicknesses have been used, ranging from 6 in. to 15 in.

Saving in Tar-sprayed Roads.—As pointed out in previous reports, the system of tar-spraying macadam roads has largely increased, with the result that an appreciable saving in the cost of scavenging and watering has resulted in those boroughs where its use has been extensive.

The committee desire again to point out that their work, as mentioned in previous reports, is confined to collecting and assimilating information relative to the paving materials and methods of paving which have been adopted in London under varied circumstances, and no attempt is made by the committee to regulate the description of paving which should be used.

The returns sent in during the past year have been put in tabulated form, and may be briefly summarised as follows:—

FULHAM.

Very large areas of bituminous macadam were laid in Fulham during the year under review. On new streets the material was laid to a depth of 2½ in. on a granite foundation, 12 in. thick, finished with 1-in. to 1½-in. topping; in some cases the surface was finished with liquid bitumen and granite chips. In the case of relays the bituminous macadam was laid to a depth of from 2½ in. to 3½ in., including topping, the old macadam with which the street was formerly paved being taken up and carted away, afterwards treated with tar and bitumen, and relaid to a depth of from 2 in. to 3 in., and finished with 1-in. to 1½-in. asphalt topping, the whole being laid on an existing foundation of hardcore. The initial cost of laying this bituminous macadam in the new streets varied from about 5s. 6½d. to 7s. 7d. per yard super. with foundation, and in the relaid street the average cost per yard super. without foundation was about 4s. 9½d., this cost being inclusive of the preparation of the road surfaces, which in several cases has been considerable.

A comparatively small area of creosoted deal blocks, 8 in. by 5 in. by 3 in., were laid, close jointed, grouted in with pitch and cement on an existing concrete foundation at a cost of about 8s. 8d. per yard super. with foundation, the work being carried out by the borough council. The creosoted deal which this paving replaced had been down about eight years.

The borough engineer and surveyor, Mr. F. Wood, states that the annual cost of maintenance of softwood roads is about 4·22d. per super. yard—*i.e.*, if certain repairs have been made in a road, the cost of these repairs is spread over the total paved surface of the road. If the cost was spread over the total wood-paved area of the roads, the cost per square yard would be 3·22d. per super. yard. In Fulham the cost [illegible] over that of previous years. This, in Mr. Wood's opinion, is due to the heavier and self-propelled traffic, which very rapidly discovers the weak parts of the paving, and which, if allowed to continue unrepaired, would develop into serious depressions, and at the [illegible] to the foundation. The policy in this borough, therefore, has been to carry out these repairs as soon as they appear, which involves extra cost; but this increased cost is more than compensated for, as a record of the wear of the timber indicates that the life of the timber is extended at least 20 per cent to 25 per cent. This increased life is possibly accounted for by the growing use of rubber tyres that are of a softer material than the timber forming the road surface, and the reduction of horse traffic. Mr. Wood states in this connection that, from a census of the traffic that has been taken, the weight of the traffic is 45 [illegible] Fulham-road alone.

Mr. Wood points out that the tar-spraying of the roads and the adoption of the method of asphalt [illegible] able change, and shows a considerable saving in the scavenging work of the borough. The amount of street refuse collected in 1906-7 was 14,189 tons. As the collection and cartage of this now amounts to about 2s. 6d. per ton and 2s. 11d. per ton for the shoot, it is evident that, if the grit which forms part of the refuse can be kept in the road by some other means than has been the case in the past, the road will improve by lasting longer, and the scavenging bill will materially decrease. Since tar-spraying and the adoption of asphalt macadam have been resorted to, the results obtained during the past four years have been very satisfactory, as last year the amount of refuse collected was 8,275 tons and this year 7,029 tons, or a reduction of about 50 per cent from 1906-7, equal to over £1,900 per annum. As this saving has every appearance of being permanent, the capital value it represents is at least £50,540. The Fulham Borough Council has abandoned ordinary water-bound macadam construction, and adopted bituminous macadam (Trinidad Lake bitumen) with great advantage. The scavenging of each road in the borough is now done once daily at no greater annual cost than before.

GREENWICH.

In Charlton-road in this borough an area of compressed asphalt, 1½ in. thick, was laid down on a 6-in. Portland cement concrete foundation at a cost of 13s. 3d. per yard super., including excavation, foundation and asphalt. This thoroughfare was previously laid in granite water-bound macadam.

HAMMERSMITH.

Large areas of main roads in Hammersmith were paved with creosoted deal, and a considerable quantity of bituminous macadam was laid in the lesser thoroughfares.

The creosoted deal 8-in. by 5-in. by 3-in. blocks were laid with close joints run in with a mixture of boiling pitch and creosoted oil, grouted with Portland cement, and sanded with a layer of ¾ in. pea gravel, the foundation of Portland cement concrete varying in depth from 8 in. to 12 in. The initial cost of laying this softwood per yard super. varied from 13s. 5d. to 15s. 4d. with foundation, and 7s. 9d. to 8s. 6d. without foundation. It appears from the returns that Jarrah and creosoted beech laid in Goldhawk-road—a heavy trafficked street—in 1898 lasted fifteen and a-half years, and that 1½-in. compressed asphalt laid in Norland-road in November, 1903, lasted ten years. Some paving—presumably creosoted deal laid in 1895 in King-street, a street carrying heavy traffic—has

[illegible] eighteen years. The wood paving was in each case laid by a contractor.

The foundation of macadam was laid from 4 in. to 6½ in. deep on a foundation of old macadam. The paving material in one case consisted of a bottom layer 3 in. thick of old macadam treated with Trinidad Lake asphalt, and finished off with a top layer of Trinidad Lake asphalt 1 in. thick. In another case the paving material consisted of a bottom layer 3 in. thick of old macadam treated with Plascom, and finished off with a top layer of new granite and Plascom 1½ in. thick. The rest of the bituminous macadam consisted of a bottom layer 3 in. thick of old macadam treated with Traverite, finished with a top layer of 1½ in. thick of new granite and Traverite, and ¾-in. granite chippings on surface. The bituminous macadam was laid by the borough council, and the cost varied from 4s. 1½d. to 6s. 3d. per yard super. without foundation. Approximately, 298,443 super. yds. of roads were tar-sprayed, at a cost of £1,028, and Mr. Mair, the surveyor, says that there has been a material increase in the cost of sweeping and watering since the adoption of tar-spraying.

HAMPSTEAD.

In Hampstead creosoted deal blocks, 9 in. by 3 in. by 4 in. and 9 in. by 3 in. by 5 in., were laid, with close joints run in with pitch and creosote oil, and grouted with Portland cement and sand on concrete foundations, varying from 8 in. to 9 in. in depth, at a cost per yard super. of from 6s. 8d. to 8s. 4d. without foundation and from 8s. 9d. to 11s. 10d. with foundation. This paving replaced Jarrah blocks which had been down from ten to thirteen years, creosoted deal blocks which had lasted eleven years, and granite setts which had been down ten years. In most cases the foundation was prepared by the local authority, and the wood paving carried out by a contractor who maintains the wood under contract.

Some Durax paving was laid in Besse-road, an important thoroughfare, the material being laid 3¼ in. depth of stones on ¾-in. tarred chippings, and grouted in with tar, at a cost of 5s. 10d. per yard super. without foundation. In Abbey-road, Lithofalt blocks 9 in. by 4½ in. by 2 in. were laid with close joints and grouted with Portland cement and sand, the blocks being laid immediately after the floating is applied. The cost of this Lithofalt paving was 8s. 9d. per yard super. with foundation, and it replaced Jarrah blocks which had been down for thirteen years.

Asphaltic macadam was also put down. This material consisted of broken granite, sharp sand, and [illegible] with Trinidad bitumen, spread over the surface while hot, and is raked over with hot iron rakes, and then compressed by steam roller. It is sealed with refined Trinidad bitumen squeegeed over the surface, and afterwards covered with small granite chippings. The cost of this asphaltic macadam per yard super. was 6s. with foundation and 5s. 9d. without foundation, this price including the preparation of the surface by the local authority, and the maintenance of the macadam for five years by the contractor.

Tar-macadam, 4½ in. in depth, was also put down at a cost of 3s. 6d. per yard super. with foundation, the work being carried out by the borough council.

HOLBORN.

A variety of different kinds of paving were laid in Holborn. In Old North-street, a residential thoroughfare, Roadamant bituminous carpet 1½ in. thick was laid on a foundation of old granite setts at a cost of 9s. 6d. per yard super. without foundation.

Besides several small areas laid in creosoted deal blocks, a large area of these blocks, 3 in. by 8 in. by 5 in., was laid in Alfred-place, a commercial thoroughfare. These were laid in bituminous grout on a 6-in. foundation, at a cost per yard super. of 11s. 3d. with foundation and 7s. 6d. without foundation.

In Gray's Inn-road a large area was laid in Acme sectional Jarrah blocks, 3 in. by 8½ in. by 3¾ in., bituminous grout on Portland cement concrete, the average depth of which was 15 in., at a cost per yard super. of 17s. 5d. with foundation, and 11s. 9d. without foundation. The work was done by a contractor, and the annual cost of maintenance per yard super. is given at 10d. Similar blocks laid on a 12-in. foundation cost the same, but the annual cost of [illegible] by 9 in. by 5 in., were put down in John-street, laid in bituminous grout on an old concrete foundation repaired, the work being carried out by the borough surveyor, at a cost of 16s. 8d. per yard super. with [illegible] given as 3d. per yard super.

Compressed rock asphalt, 2 in. thick, was laid, compressed with heated pilons on a 9-in. Portland cement concrete foundation, at a cost per yard super. of 14s. 6d. with foundation and 10s. without foundation. Some asphalt macadam, "pouring-in system," laid 3 in. deep in Guernsey granite 1½-in. gauge, grouted with asphalt and bitumen, on a foundation of hard core, &c., was laid at a cost per yard super. of 7s. 2d. [illegible]

In Red[illegible]-street, [illegible] "Jacksid" macrete granite blocks, 9 in. by 9 in. by 4½ in. These were laid in Portland cement grout on a 12-in. Portland cement concrete foundation, at a cost of 13s. 6d. per yard super. without foundation, the annual cost of maintenance being 3d. per yard super. In New Oxford-street (north side by Tottenham Court-road) fine dressed granite setts, 5 in. by 4 in., were laid in Portland cement concrete on a foundation the average depth of which was 9 in., the work being carried out by the borough council, at a cost of 35s. per yard super. with foundation.

ROYAL BOROUGH OF KENSINGTON.

The greater part of the paving laid in this borough consisted of creosoted wood blocks, 8 in. by 4 in. by 3 in., 8 in. by 5 in. by 3 in., and 8 in. by 4½ in. by 3 in., laid, grouted in tar, pitch and cement, on a 6-in., and in one case on a 12-in., Portland cement concrete foundation, the cost of laying per yard super. varying, for the paving on the 6-in. foundation, from 7s. 2d. to 8s. 10½d. without foundation, while that on the 12-in. foundation cost 14s. 6½d. per yard super. with foundation.

Some Kensington asphalt clinker blocks were also laid, but particulars of the cost are not given. A [illegible] was laid on 8 in. of concrete, at a cost per yard super. of 9s. 6d. with foundation.

CITY OF LONDON.

Most of the paving laid in the City consisted of stone in the form of Aberdeen granite setts. These 3 in. by 6 in., 5 in. by 4 in., and 4 in. by 6 in. setts were laid in cement grout on a 9-in. Portland cement concrete foundation, except in one case, where the setts were on a 6-in. foundation. The cost of the new 3-in. by 6-in. setts was 19s. 3d. per yard super. with the 9-in. foundation, and 16s. 3d. without foundation, the cost of the redressed setts on the same [illegible] without foundation.

Natural rock asphalt comes next from the point of view of quantity laid down. This material was laid 2½ in. deep, compressed in situ on a 9-in. Portland cement concrete foundation, at a cost per yard super. of 15s. 3d. with foundation and 9s. without foundation, plus 1s. 5d. credit for old asphalt. The annual cost of maintenance for the asphalt laid in Coleman-street is 9d. per yard super., while the cost of maintenance of that laid in Fenchurch-street is 1s. 3d. [illegible] which had been down thirty-one years in Coleman-street and eighteen years in Fenchurch-street.

A large area of creosoted deal blocks, 7 in. by 3 in. by 5 in., were also laid, the joints being filled in with a boiling mixture of pitch and oil, and in the case of [illegible] strips, 1½ in., were inserted between every fifth course, laid angularly about ½ in. above the surface of the wood blocks. This latter paving was laid on a 9-in. Portland cement concrete foundation, at a cost of 15s. 5d. per yard super. with foundation, and 10s. 4d. without foundation, the annual cost of maintenance per yard super. being 10d. The cost of the ordinary creosoted deal paving laid on a 6-in. existing Portland cement concrete foundation was from 9s. 1d. to 9s. 5d. with foundation, and 7s. 9d. to 8s. 7d. without foundation, per yard super., the annual cost of maintenance varying from 9d. to 1s. 5d. per yard super.

LONDON COUNTY COUNCIL.

The return from the London County Council deals with paving works carried out by that council in Hackney and Islington, the materials used being sectional Jarrah, sectional Acme paving, creosoted deal and Aberdeen setts. The sectional Jarrah was laid in bitumen, the creosoted deal in pitch, and the [illegible] concrete foundation. The cost per yard super. of the sectional Jarrah was 16s. 3½d. with foundation and 12s. 6d. without foundation; of the creosoted deal,

15s. 10½d. with and 11s. 6d. without foundation, and of the Aberdeen setts, 19s. with and 15s. 4d. without foundation.

ST. MARYLEBONE.

This borough has continued itself both to wood pavement and renewals, exclusively to 5-in. by 3-in. by 9-in. creosoted yellow deal blocks, of which they laid over 22,000 super. yds. These were laid close-jointed, and grouted with pitch and creosote oil. The new paving was laid on a 12-in. cement concrete foundation by the borough council with direct labour at a cost of from 18s. 9½d. to 19s. 6d. per yard super. with foundation. The renewals were laid in the same manner, on foundations of varying thickness, at a cost of from 9s. 10½d. to 10s. 1½d. per yard super. without foundation. Considerable tar-spraying was done, 80,430 super. yds. of roads being so treated at a cost of £678 5s. 10d., while very large areas were laid in tar-macadam.

The tar-macadam was laid bedded on an old macadam foundation to a depth of 4½ in., when finished, in two coats, the bottom coat 2½-in. gauge 3 in. thick, the top coat 1½-in. gauge 1½-in. thick, the work being carried out by contract at a cost verying from 4s. 11d. to 5s. 3d. per yard super. without foundation.

WANDSWORTH.

In streets with an easy gradient this borough has laid creosoted softwood blocks, 8 in. by 3 in. by 5 in., dipped in a mixture of tar and pitch, and grouted with Portland cement mortar on a 9-in. Portland cement concrete foundation. The work was carried out by a contractor for a lump sum, the price in the schedule attached to the contracts being from 14s. 8d. to 14s. 10d. per super. yard, with foundation, for extra work. Wandsworth has carried out a great deal of tar-spraying, costing per super. yard for first-coat work, grit 1¼d., granite chips 1¾d., second-coat work 1d. The surveyor, Mr. Dodd, states that the decrease in the cost of scavenging for the year ended March 31, 1914, compared with the year ended March, 1907, when no tar-spraying was done, was no less than £10,194, while the decrease in the cost of watering was £7,051, and the decrease in the loads of slop and sweepings removed 35,989.

When the gradient has been heavy—1 in 15 to 1 in 23—Aberdeen granite setts, 3 in. by 6 in., were laid, rammed and grouted with Portland cement mortar on a 9-in. Portland cement concrete foundation, the work being done by a contractor for a lump sum, the price in the schedule being 13s. per super. yard for extra work.

WOOLWICH.

Various kinds of asphalt, softwood and Durax granite cubes figure in the return from Woolwich.

The 7-in. by 3-in. by 5-in. creosoted softwood blocks were laid in pitch on a 9-in. Portland cement concrete foundation. No floating was used, the concrete being worked to a smooth surface. The foundation was laid by the local authority, the wood paving being carried out by contractors under one year's maintenance contract, at a cost per yard super. of 14s. with foundation and 6s. 6d. without foundation.

In Eltham-road a very large area of Durax granite cubes, 3 in. by 4 in., were laid in 8 to 10 cement mortar, the machine-cut cubes being in intersecting segmental courses on a bed of ¼-in. tarred chippings, rack-up joints, consolidated by steam rolling, grouted with boiling pitch and surface-blinded with granite chippings before the pitch has solidified, the existing macadam roadway being excavated to the required depth, and the foundation consolidated by steam rolling. The cost of this Durax paving was 8s. per yard super. with foundation, the work being carried out by contractors under a five years' maintenance contract.

Bradshaw's rock asphalt carpeting, 1½ in. deep, was put down in two layers, at a cost per yard super. of 7s. with foundation and 6s. without foundation. Val de Travers natural asphalt macadam was laid, consisting of 4 in. of 2-in. Guernsey granite, the interstices being filled with natural asphalt matrix covered before cooling with granite chippings and consolidated to 3 in. thick with a 10-ton roller, at a cost per yard super. of 8s. 5d. with foundation and 7s. 6d. without foundation. "Roadamant" patent asphalt carpeting was laid 1 in. deep, in one layer, at a cost per yard super. of 7s. 3d. with foundation and 5s. 11d. without foundation.

CITY OF WESTMINSTER.

This return deals with two streets which are stated by the city engineer to be typical of the paving works executed by the Westminster City Council. Grosvenor-road was laid in softwood blocks, 3 in. by 8 in. [illegible] per cubic foot, laid, pitch-grouted, on an 8-in. Portland cement concrete foundation, the work being done by a contractor under a twelve months' maintenance contract, at a cost of 14s. 6d. per yard super. with foundation and 8s. 6d. without foundation.

Craig's-court, a highway with very little traffic, was laid in natural rock asphalt, 2 in. thick, on a 9-in. Portland cement concrete foundation, at a cost per yard super. of 13s. 10½d. with foundation, including excavation, and 8s. without foundation.

The city engineer expresses the opinion that tar-spraying generally tends to reduce the cost of scavenging [illegible]

The committee append to their report a return compiled from information supplied to them by the officers of the City of London and fourteen metropolitan boroughs giving the mileage of the different kinds of paving and materials used, &c., as existing in the years 1910 to 1913, and the tonnage of slop removed.

A similar return was published last year in respect of the years 1910, 1911 and 1912, and the figures for the year 1913 have been added so far as they have been [illegible] decrease in the quantity of slop removed in those boroughs where there has been an increase in the mileage of tar-sprayed and asphalt macadam roads. In Fulham, for example, where the mileage of asphalt macadam roads has increased from 2 in 1910 to 9 in 1913, the tonnage of slop removed has gone down from 9,038 in 1910 to 7,029 in 1913. The amount of street refuse collected in this borough in 1906-7 is stated to be 14,189 tons, and the reduction is attributed, to a large extent, to the tar-spraying of the roads and the adoption of asphalt macadam construction. The Royal Borough of Kensington also shows a marked decrease in the quantity of slop removed. In [illegible] sprayed since 1910, and the quantity of slop removed has fallen from 24,694 tons in the year named to 18,515 tons in 1913. In the borough of Wandsworth, where the mileage of tar-painted roads has increased from 37 in 1910 to 106 in 1913, the number of loads of slop removed went down from 55,810 in 1910 to 32,414 in 1913. Compared with the year ended March, 1907, when no tar-spraying was done, the decrease in loads of slop and sweepings removed for the year ended March, 1914, in this borough is stated by the borough engineer to be 35,989.

Generally speaking, there has been a decrease in all boroughs in the amount of slop removed, and this is probably due, to some extent at least, to the reduction in horse traffic, apart from the causes above referred to.

The committee also append to their report a return showing the cost of maintenance, &c., of the roads in the City of London and various metropolitan boroughs. The expenditure under the first item—*(a)* Maintenance (including new paving works), Repair and Improvement, of course, varies from year to year according to the number and importance of the streets repaved. Generally speaking, there has been a slight increase in the amount expended under this head as compared with the previous year, although in a few instances there was an appreciable reduction.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 3s.). Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

New Swing Bridge at Dalmuir. One of the two swing bridges constructed over the Forth and Clyde Canal at Dalmuir was formally opened recently. The necessary powers for the construction of the bridge were obtained by Clydebank Town Council in 1901, and the order was transferred to the Glasgow Corporation on lease for forty-two years for the purposes of the corporation tramway system. The bridge consists of a single-swing span, constructed of steel with the necessary concrete foundations. The roadway is 20 ft. wide, and there are 5 ft. footpaths. A double line of tramways has been laid on the roadway, and the Glasgow cars, which at present only go as far as the east side of the canal, will in future run on to the western boundary of Clydebank. The laying of the tramways across the new bridge at Dalmuir gives a continuous tramway route from Glasgow to Loch Lomond. Messrs. Crouch, Hogg & Easton, Glasgow, were the engineers, and the bridge was constructed by Messrs. Robert McAlpine & Sons.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

COUNCIL MEETING.

At a meeting of the council of the Institution of Municipal and County Engineers held at 92 Victoria-street, Westminster, on Saturday, the 6th inst., there were present Messrs. J. S. Pickering (president, in the chair), J. Patten Barber, W. N. Blair, J. A. Brodie, J. S. Brodie, Chas. Brownridge, G. F. Carter, E. J. Elford, Frank Harris, T. W. A. Hayward, E. B. Martin, F. Massie, P. H. Palmer, W. H. Prescott, Norman Scorgie, W. Stubbs, R. J. Thomas, H. T. Wakelam, O. E. Winter, the consultant secretary, and the secretary.

CONGRATULATIONS.

It was resolved to offer the congratulations of the council to Mr. N. Scorgie (Hackney) on being elected to the office of president of the Society of Engineers.

THE MEMBERSHIP ROLL.

The following candidates were elected

Members: Messrs. D. H. Brown, chief assistant to county surveyor, Durham; R. E. Ford, deputy borough surveyor, Doncaster; W. H. Lewis, chief assistant engineer and surveyor, Wembley Urban District Council; and E. Potts, chief assistant to borough engineer, Rotherham.

Associate-members: Messrs. P. H. Audsley, building and drainage surveyor, Dewsbury; J. H. Gregson, engineering assistant, Town Hall, Bolton; and T. C. Humphreys, chief assistant engineer, Festiniog Urban District Council.

Student: Mr. H. Kellett, articled pupil to borough engineer and surveyor, Douglas, Isle of Man.

LETTER OF CONDOLENCE.

It was resolved to send a letter of condolence to the relatives of the late Mr. W. Bell, county road surveyor, Aberfeldy.

BROKEN STONE AND CHIPPINGS.

A letter was received from the Engineering Standards Committee with reference to the Standard Specification for Broken Stone and Chippings, and especially with regard to the excessive lengths of stone.

It was decided to inform the committee that the council do not consider it desirable to specify any particular stone as exhibiting the deficiency referred to, and to point out that it is not only the cleavage of the stone or its character, but also the method of breaking which results in stones of excessive lengths.

UNEMPLOYMENT INSURANCE.

Unemployment of Road Workmen.—The decision of the umpire with regard to the payment of contributions in respect of unemployment of road workmen was received as follows:—

> On the facts before me my decision is that contributions under Part II. of the National Insurance Act, 1911 (Unemployment Insurance), ARE payable in respect of workmen employed wholly or mainly in re-surfacing existing roads where it is necessary to relay or to strengthen the foundations, including laying for the first time, or relaying, concrete underlying wood, stone, brick, asphalt, &c., but excluding:
>
> (1) Putting a thin layer of concrete over existing concrete merely for the purpose of smoothing the surface or of adjusting the level.
>
> (2) Reinstatement of the roadway solely in connection with repairs to mains or to tramway lines.
>
> (3) Work in connection with isolated patching or to isolations.
>
> (This decision modifies any previous decision with which it may be in conflict.)

It was resolved to inform the umpire that the council are of opinion that the award is not sufficiently explicit, and will be found difficult to follow in practice.

NATIONAL GUARD.

A letter was received from Mr. W. Noble Twelvetrees with reference to the formation of a corps of engineers as a technical branch of the National Guard. It was resolved to inform Mr. Twelvetrees that the council will be glad to assist the movement in any way they can.

LONDON SANITARY COMPANY.

The president reported information which he had received with regard to the work of the London Sanitary Company, and it was resolved to insert the following notice in the next *Journal*:—

> Recruits for London Sanitary Companies.
>
> It having come to the knowledge of the Council that the work with the Expeditionary Forces for which the above companies are being formed may not be appropriate to the attainments and professional standing of recruits drawn from the offices of municipal and county engineers, it is suggested that members of the institution should, before joining, make inquiries as to the work they may have to perform. In case of any doubt it will be desirable to communicate with the War Office or some reliable agency.

STANDARD BITUMINOUS COMPOSITION FOR SPECIAL JOINTS ON STONEWARE PIPES.

The question of instituting a standard composition for special joints having been brought to the notice of the council by Mr. T. J. Moss-Flower, it was resolved to ask the Sectional Committee of the Engineering Standards Committee to consider this question at an early date.

HOUSING SCHEMES.

A letter from the Town Planning Institute enclosing a copy of the memorandum to the Presidents of the Local Government Board and the Board of Agriculture on the subject of housing schemes was considered, and it was resolved to inform the Town Planning Institute that the council are of opinion that the suggested average of twelve houses per gross acre, while desirable in undeveloped districts, will, in many cases, be found to be impracticable.

It was also resolved to draw attention to the apparent error involved in the statement that twelve houses per acre is the highest average adopted in the Quinton and Harbourne town planning scheme.

TOWN PLANNING SCHEME CONFERENCES.

It was resolved to appoint representatives to confer with representatives of the Surveyors' Institution with the object of drawing up a memorandum calling attention to the desirability of conferences between municipal engineers and surveyors or agents of landowners in connection with the preparation of town planning schemes.

HOUSING AT COLWYN BAY.

L.C.B. AND THE PRICE OF BUILDING MATERIALS.

The Local Government Board recently addressed a letter to the Colwyn Bay Urban District Council asking what they were doing in the way of providing dwellings for the working classes. An estate at Llandrillo has been purchased for such dwellings, and the council have prepared a scheme for the provision of a large number of houses; but, owing to the war's effect on prices and on the value of money in the market, they have for the present refrained from asking for tenders for the erection of the buildings. A reply to this effect was sent to the Local Government Board.

The Local Government Board have now written as follows:

"There has generally been a tendency to overestimate the increase in the cost of building cottages due to the rise in the price of certain materials, such as timber. As the cost of such materials forms only a small percentage of the total cost of a cottage, an allowance of 2½ to 5 per cent per cottage should, in ordinary circumstances, cover any such increase. In view of the need for further houses disclosed at the inquiry, it appears to the board that the scheme should be carried out without delay."

Mr. E. Allen said it was absolute nonsense to say that 2½ to 5 per cent represented the increased cost of building. It was more like 15 to 20 per cent.

Mr. J. T. Taylor: It is 60 per cent in some cases.

Mr. Allen: Very absurd letters come from these public [illegible] at the present time.

Institution of Civil Engineers. At the next meeting Mr. H. E. Yerbury, M.Inst.C.E., will submit for discussion a paper entitled "The Electrolytic Action of Return Currents in Electric Tramways on Gas and Water Mains, and the Best Means of Providing against Electrical Disturbances." The chair will be taken at 8 p.m.

A Glossary of Road Terms. By H. Percy Boulnois, M.Inst.C.E. St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C. Price 2s.—Mr. Boulnois has achieved far more than he may imagine by this production of his pen. He set out to standardise the nomenclature of road terms; in addition he had made a valuable addition to English literature. To the untutored it is like reading a new language; Mr. Boulnois says it isn't anything like "complete." At any rate, it is a valuable *vade mecum* which no one has attempted before.—*Portsmouth Times.*

The Purification of Brewery Wastes.—(V.)

By G. BERTRAM KERSHAW, M.AM.SOC.C.E., M.INST.C.E., Late Engineer to the Royal Commission on Sewage Disposal.

Brewery wastes are met with in most country towns, and often give rise to trouble from smell, either in the sewers of the town itself or at the sewage works, where the mixed sewage and brewery wastes are dealt with.

Very briefly described, brewing consists in obtaining a solution of sweet [illegible] malt. Hops are added to the wort, which is next boiled. After cooling the liquid is fermented with yeast, resulting in the production of beer.

Malting is often carried out on the brewery premises, and consists in steeping barley in water for a certain period after which the grain is placed on floors to germinate, or sprout, [illegible] It is afterwards dried. The soaking process may be brought about either by placing water continuously through the tanks in readiness in which the grain is steeped, or, alternatively, by quiescent soaking—i.e., successive filling and drawing off of water from the grain tanks.

Brewery wastes absorb oxygen very greedily, and they are difficult to treat satisfactorily by themselves, while, when mixed with sewage, the treatment of the combined liquid is by no means always an easy matter, especially if the brewing wastes predominate.

The mixed wastes from a brewery often take up as much as 60 parts per 100,000 of oxygen from permanganate in four hours at 80 deg. Fahr., while the solids both in solution and in suspension are usually very high.

The chief point to be borne in mind is that the wastes should, if possible, never be permitted to develop acidity, and it is for this reason that lime is so frequently employed in dealing with this particular waste.

Quite apart from nuisance at the sewage works, wastes from breweries may cause trouble in town sewers, especially where the gradients are slack and junction manholes [illegible] bad spots being often noticeable in the streets, particularly in hot, close weather. Occasionally openings in manhole covers and vent pipes may be seen quite whitened with sulphur derived from the sulphuretted hydrogen given off.

The drains of an old brewery are often found on examination to be faulty and badly laid, liquid lying in them and [illegible] at the end of the week.

It is questionable whether brewery wastes should not, in certain cases at all events, receive preliminary treatment at the brewery before they are discharged to the sewers. Certainly this would be the best way of preventing local nuisance from manholes, vents, gullies, &c.

It is often assumed that the comparatively clean-looking steep waters derived from maltings are innocuous. As a matter of fact they are usually quite about as strong organically as a domestic sewage of average strength. They encourage dense growths of fungus in rivers and streams, and they should always be properly treated before discharged into any stream.

Nearly all the waste liquors from a brewery are more or less polluting, with the exception of attemperating and refrigerating water, which is practically clean water, and can be treated as such.

The worst waste liquid from a brewery is undoubtedly that derived from the cask and bottle washing department. Hot water and steam is used during this cleaning process, and the waste liquor is made up of stale beer, spent hops, moulds, gummy matter, dirt, &c., diluted with water. Such a liquid naturally becomes offensive very rapidly, especially if the empty barrels have been much exposed to the sun, and if retained for any length of time it becomes extremely acid. Permanganate of potassium and bisulphide of calcium are frequently employed to cleanse the casks.

Turning to the volume of wastes produced, these will vary somewhat in different breweries, and also in the same brewery at different times of the year, as an approximation, it is probably from two to five times the volume of the beer brewed.

Careful observations in the case of a brewing plant producing both light and heavy beers, with a capacity of some thirty-five quarters, have shown that on an average some 4,000 gallons of waste liquor are produced per twenty-four hours.

Malting is not carried on contiuously throughout the year; consequently at certain times the waste waters from this source are absent.

Again, refrigerating and attemperating waters may either be allowed to mingle with the rest of the wastes or they may be discharged separately, and in hot seasons larger volumes of water will be required than in cold. Accordingly, the general waste liquors will be diluted, or the reverse, as the case may be.

The [illegible] this may depend somewhat upon the nature of the trade done, accordingly as large or small casks are [illegible] steep water in the malting season. "Square" water and washings from the yeast backs, floors and fermentation squares generally come next in point of volume, while washings from the brewing vessels are usually comparatively small in volume. Other waste liquids come from the drainings from grain, [illegible]

It may be as well to take a few instances where brewery wastes have caused pronounced trouble.

At Burton-on-Trent, where nearly 70 per cent of the sewage they [illegible] per twenty-four hours—consists of refuse liquor from breweries, the sewage is treated on a sewage farm some [illegible] many years, having been originally recommended by Prof. Dewar. The dose of lime given is extremely heavy, amounting to some 57 parts per 100,000.

Previously to the adoption of lime treatment very great nuisance from smell had been caused by the fermentation of the brewery wastes in conjunction with sewage solids when they arrived at the farm. [illegible] while improving the quality of the effluent very greatly. The lime was added to the sewage before it was pumped to the farm, and there was no preliminary tank treatment. By this method the lime would doubtless become thoroughly mixed with the sewage, but tank treatment at the farm would seem to have been indicated; while it would appear probable, on the face of it, that the incrustation of the pumping main—now about to be duplicated—may have been very largely due to the application of the lime at the pumping station. The temperatures of the brewery wastes at Burton are frequently high, and this accentuates any smell there may be by tending to hasten the decomposition of the waste liquors, sulphuretted hydrogen being set free.

At Stratford-on-Avon the sewage sometimes contains up to about 40 per cent of brewery waste. The sewage in this particular instance is treated by means of septic tanks, percolating filters, and land, and a good deal of smell was caused at times by the septic tanks; this smell, however, was very considerably reduced by the lime treatment adopted by Mr. H. D. Bell, the chemist and manager. The quality of the effluent obtained, it should be stated, is of high class.

With regard to the treatment of brewery wastes upon land, unless good preliminary tank treatment is employed there will usually be times when the effluent smells more or less of beer; albeit the land may be of excellent quality, both as regards soil and subsoil.

At Shepton Mallet, some years ago, crude brewery wastes were admitted direct to the sewers, their volume being equivalent to about 33 per cent of the total sewage flow, and nuisance from smell occurred, not only at the sewage farm, but near the manholes in the town. At that time the sewage, after light tank treatment, was dealt with upon land of very poor quality lying on a steep slope. Nuisance arose from smell, and from fungus in the stream into which the effluent passed. Subsequently, the breweries gave their wastes preliminary treatment in tanks with lime and alumino-ferric before discharging them into the sewers. The sewage was also given full tank treatment, together with a small dose of lime, and sludge pressing was adopted. The nuisance from smell ceased in consequence, and the fungus disappeared from the river.

Later on percolating filters were put down to keep

pace with the growth in population, and also to assist the land, ordinary settlement being adopted in lieu of chemical precipitation. Smell from the tanks increased, but only in the actual vicinity of the tanks, and a very good effluent was obtained.

The writer has known an instance where contact beds following settling tanks were completely thrown out of action by an acid tank liquor, analyses showing that the contact beds were effecting no purification whatever. A small dose of lime added to the sewage before it entered the tanks neutralised this acidity, and the contact beds began to yield satisfactory results.

In this particular case it was by no means clear that there was not some acid liquor coming down from the brewery occasionally, and, as a matter of fact, sulphuric acid is frequently used in breweries for cleaning out various vessels. Stale beer, as is well known, very soon becomes intensely acid.

Regarding cases where the brewery wastes must be dealt with without admixture with sewage.

Percolating filters offer a much better chance of thoroughly oxidising a highly polluting* liquor than contact beds, and with the latter the first flush from the beds is nearly always putrescible. The Sewage Disposal Commission arrived at the conclusion (Fifth Report, p. 119) that, "taking into account the gradual loss of capacity of contact beds, a cubic yard of material arranged in the form of a percolating filter will generally treat satisfactorily nearly twice as much tank liquor as a cubic yard of material in a contact bed." They go on to say, however, "In the case of sewage containing substances which have an inhibitory effect upon the activity of micro-organisms, the working power per cube yard of filter of either type may be more nearly equal. This point, however, is not clearly established."

The inhibitory substances mentioned here have reference to sterilising matter—such as that contained in gas liquor and the like—and do not apply to brewery wastes, the only sterilising agencies in which are acid and arsenic, the latter in negligible quantities. Moreover, it has been shown by experiment that in the case of tannery wastes very large amounts of arsenic indeed may be introduced without stopping or inhibiting nitrification.

The difficulty arising if percolating filters are used for dealing with a strongly smelling septic liquor would be from the smell caused during distribution, and if it is intended to treat septic brewery wastes in such a way, it would be preferable to treat it in the first place by single or double contact, and subsequently thoroughly to oxidise the resulting contact effluent by passing it through a percolating filter, when the question of smell would hardly be likely to arise.

There is no question but that contact beds as a first process after tank treatment cause a minimum of smell; but, on the other hand, especially in the case of small installations, where expert supervision is often lacking, attention is apt to be focussed on the depth of sludge in the tank, increased suspended matter in the tank liquor entering the contact beds not receiving much attention. If the tank liquor the beds are receiving is heavily charged with suspended matter, the tank naturally does not contain much depth of sludge.

If contact beds are used, as nearly every [illegible] it will be found that triple contact will be necessary to [illegible] containing more than 3 or 4 parts of suspended matter per 100,000, or possessing more than about 4 parts of dissolved oxygen in five days.

In constructing small experimental percolating filters for the treatment of brewery or other similar wastes, it may be noted that a cheap and efficient method of retaining the filtering material in position is to use small-meshed galvanised wire netting supported by wooden posts spaced at intervals, thereby obviating the necessity for walls of brick, stone, or large clinker. For filters treating such liquors as pot-ale from distilleries, which is extremely acid, the netting should be carefully protected by dipping in Japan paint or in tar. If even stout galvanised sheets are placed over tanks containing crude pot-ale, they become corroded through in quite a short time.

Regarding the use of by-products derived from brewing, the grains form, as is well known, excellent feeding stuff for cattle. The yeast at some breweries is filter-pressed, while in other cases it is discharged to the drains. It would seem very advisable to keep back yeast cells from the sewers as far as possible.

In many cases where brewing wastes are dealt with by a separate purification plant, there is often a good deal of smell arising from heaps of spent hops, refuse screened out from cask and bottle washings, &c. A sprinkling of soot over such heaps has been found to be efficacious in keeping down smell. Bleaching powder is another useful deodorant which can be used, while manganate of soda can be applied in the form of a solution and sprayed on the refuse. Sodium manganate is a dark-green chemical, a good deodorant, and might be used much more extensively at sewage works where smell arises; it was used at Wimbledon some years ago by the late Santo Crimp, the manganate being dissolved in warm water, and used at the rate of about 2 grains per gallon.

The writer knows of no other trade refuse so liable to give rise to nuisance from moulds and fungi of different kinds as brewery waste. Creamery waste is bad in this respect, but a very slight dribble of brewery waste in a stream will very soon result in the bed becoming covered with masses of fungus.

It seems probable that the yeast cells present have a good deal to do with this production of fungoid or gelatinous growths, many of which are often suffused with a pinkish tint. Apparently they do not thrive so well in a very polluted liquid, as in one which contains a certain amount of oxygen in solution.

The nuisance from growths of this kind is generally caused by their decay and detachment, which often happens in hot weather, when presumably the liquid in which they grow does not contain sufficient oxygen to support them. In this respect it has often been remarked that some of the common sewage fungi—*e.g.*, *Leptomitus lacteus* and *Beggiatoa alba*—most growing in a polluted stream, always appear to thrive more luxuriantly at points where comparatively clean water enters the polluted stream.

* By "strong" liquor is meant a liquor capable of using [illegible] oxygen to [illegible] purification.

ROAD MAINTENANCE.

THE QUESTION OF CONTRIBUTIONS.

In the House of Commons on the 11th inst. the President of the Local Government Board was asked when it was intended to set up the proposed Joint Committee on the subject of contributions to the cost of road maintenance by the owners of motor vehicles causing exceptional damage to the roads.

Mr. Herbert Samuel said he had been making inquiries of the authorities of both Houses. These were not yet complete. He hoped it might be found practicable to set up the proposed committee during the present Session.

PRO PATRIA.

TWENTIETH LIST.

We present herewith the twentieth list of municipal engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Adamson, —, engineer and surveyor's department, Chiswick, sergeant, Queen Victoria's Rifles.
Bates, A. G., engineer and surveyor's department, Chiswick, R.A.M.C.
Williams, W.C., engineer and surveyor's department, [illegible], Royal Bucks Hussars.

Swansea Electricity Works.—The extensions which have been in progress for a long time at Swansea Corporation electrical works and which are to cost about £40,000, are now almost complete. It is claimed that the works are now sufficiently powerful to meet the requirements not only of the existing borough, but of future extensions. It is hoped to be able to compete with gas on even terms.

New Scheme for South-West Birmingham.—The Town Planning Committee of the Birmingham City Council are engaged in the preparation of a new scheme of town planning for South-West Birmingham. The area of land covered by the scheme is about 9,000 acres, and it forms the largest scheme yet undertaken in Birmingham. It applies to all the undeveloped land in Selly Oak and Northfield Wards and will connect on the one side with the scheme now being prepared for South Birmingham, and on the other side with the Quinton and Harborne scheme.

CORRESPONDENCE.

The Editor does not hold himself responsible for the opinions expressed by correspondents.

ELECTRICALLY-DRIVEN DUST VANS.

To the Editor of THE SURVEYOR.

SIR,—My attention has been drawn to an article under the heading "Refuse Disposal," appearing in your journal of 29th ult. In this some reference has been made to a test with an Edison accumulator-driven vehicle which was engaged upon the collection of house refuse, in competition with a super-heated steam wagon, also a petrol wagon.

It may interest your readers to know that Mr. J. G. Carey, engineer to the Heston and Isleworth District Council (where the tests took place), appreciating that he had no previous experience with these vehicles, made ample allowance for every item of maintenance, his method being to ask manufacturers for what amount per annum they would undertake all liabilities, not necessarily intending to accept that contract, but in order to have these figures as a safeguard.

Even under these conditions the saving was in favour of the electric to the amount of £5 per annum. £5 on one vehicle is unimportant, but where a number of vehicles are actively employed as in the case of a municipality, this £5 becomes an important item. I presume that the method of arriving at the steam wagon maintenance figures was based on the same principle; hence the reason for allowing two days per month for its overhaul. In the case of the Edison electric, one half-day per month would be ample, whereas with the more complicated steam engine this may not suffice.

Mr. Carey in his desire to allow for all possible contingencies may have taken rather a high estimate for the steam vehicle, but he has done so equally with the electric, the writer's experience being that the electric vehicle Mr. Carey is purchasing will prove far more economical than he has anticipated in his report.

Without wishing in any way to decry any type of steam wagon, the writer, who has had experience with both types of vehicles, is certain that the electric will prove more economical, provided the class of work is of a suitable character. A further consideration must not be lost sight of, and that is the possibility of objections being raised to the noise of a steam wagon run in residential districts each morning.

A test has recently been made by Mr. C. Bruce Tomes, surveyor to the Barnes Urban District Council, on the same class of work, with the result that he, too, has decided in favour of the electric, and his council has now voted in favour of the purchase of four of our standard dust collection vans, fitted with the electrically-operated tipping gear, which does so much to reduce the time wasted by the less modern hand-tipper hitherto available.

These four vehicles will carry a larger amount of refuse per annum then eleven horse vans did hitherto. —Yours, &c.,

Edison Accumulators, Limited.
W. H. L. WATSON,
General Sales Manager.

RECENT CIRCUMSTANCES AFFECTING ROADS.

To the Editor of THE SURVEYOR.

SIR,—The Roads Improvement Association has, through its engineers and expert advisers, exceptional opportunities of watching the behaviour of roads as affected by traffic and climatic influences. Since October last the weather conditions have been abnormal, and this, combined with the exceptionally heavy traffic which has arisen in many localities owing to the war, such as the movement of troops, guns, ammunition and so forth, will, it is feared, seriously affect the roads for some time to come.

The association is fully aware that every attention is given to our roads by those responsible for their maintenance, but it considers that the general public may not be aware of the exceptional circumstances which lately have pertained.

From a report by the Thames Conservators it appears that nearly six months of average rainfall fell during November and December, and that the month of January was little better. In addition, the changes of temperature were extraordinary—an almost summer temperature of 54 deg. Fahr. was followed by a drop of 20 deg., and succeeded by a similar rise, and this occurred seven or eight times during the month of December.

These sudden and [illegible] changes of temperature accentuate the [illegible] caused by the passage of traffic, as the water is, in effect, "pumped" in and out of all porous surfaces exposed to the weather with disastrous effects. This "degrading" influence has been very severely felt in the case of some of the recently completed modern roads, especially those which had scarcely been finished when these abnormal climatic conditions commenced.

It is well known that even with some of the modern systems of road surfacing the necessary consolidation is not acquired until the original process of rolling has been supplemented by at least a few months of wheeled traffic.

It must be expected, therefore, that many bituminous road surfaces which were completed during the autumn will show [illegible] deterioration from the causes that have been mentioned. It may be some consolation, however, to road surveyors, who may be blamed for the bad condition of their roads, to know that these weather conditions have affected nearly everyone alike.

It would be interesting to ascertain how far different parts of the country have been similarly affected, and what has been the effect on the various modes of road construction — for instance, whether the "penetration methods" have stood better than "mixing methods"; and how far ordinary water-bound macadam, protected by several years' of tar-painting, has stood this exceptionally trying time.

It would be of considerable interest if surveyors who have suffered from these weather conditions would communicate with the association, sending reports of their experiences, with notes, as to exceptional rainfall, changes of temperature, and other memoranda.

If a record could be prepared of these reports and observations, and a comparison made as to the behaviour of the various new methods of road construction under these trying conditions, much valuable information of the greatest service to all now engaged upon road work would be available. Such information would also be of considerable interest to all road users, and, in fact, to the whole community.—Yours, &c.,

WALLACE E. RICHE,
Secretary,
Roads Improvement Association.

SUPERANNUATION.

To the Editor of THE SURVEYOR.

SIR,—Having read with great pleasure and interest your article—with which I thoroughly agree—upon Mr. E. P. Hooley's resignation, it struck me how helpless municipal officers are with regard to retiring allowances.

Here is Mr. Hooley's brilliant service of twenty-five years—and many more of us have done similar periods of brilliant work, almost unrecognised. If any recognition—*i.e.*, retiring allowance—be given, it will only be an act of grace; yet a policeman or Poor-law officer can claim such a reward as a right.

What an argument for the superannuation scheme which has been on the tapis so long! When, oh! when will it reach the House of Commons? That all the other branches of rate-paid officials can claim superannuation benefits, excepting ours, ought to be an all-sufficient reason for its extension to ourselves. An optional Act is useless, so far as most rural district councils are concerned. It must be compulsory. But let it be soon.—Yours, &c.,

R.D.C. SURVEYOR.

February 17, 1915.

Rifle Ranges for London Parks.—London County Council Parks Committee have been considering the question of provision of rifle ranges. The committee recommends, as a matter of urgency, that the power being sought from Parliament to provide accommodation for games and recreations in parks and open spaces shall be extended to include rifle ranges.

Law Notes.

Edited by J. B. REIGNIER CONDER, 57 Moorgate-street, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of The Surveyor, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction i.e., without re-drawing or amendment. *Unless these conditions are complied with we cannot undertake to reply to queries.*

Compulsory Purchase. Ascertainment of Price.—An interesting point in connection with the compulsory purchase of land by local authorities was decided in *Re South-Eastern Railway Company and London County Council* (Chancery Division, Mr. Justice Eve). The company were the owners of two freehold shops, Nos. 9 and 10 Strand, at the corner of Craven-street, and of several adjoining houses fronting the latter street. The council gave notice to the company to treat with respect to a strip forming a portion of the site of the shops, and this notice was afterwards superseded by a contract between the parties for the sale of the land required at a price to be determined by arbitration under the Lands Clauses Acts. The arbitrator fixed the price at £18,330; but he declared that if (as contended by the council) the true measure of the price were the difference between the aggregate value of the whole of the Strand and Craven-street property before the service of the notice to treat, and their aggregate value after the taking of the frontage slip, the price would be only £3,465. Mr. Justice Eve decided against the council's contention. In the course of his judgment his lordship said that there was no authority for the proposition contended for by the council. But that was not the same thing as saying that it could not be established, and it was necessary to examine and see what would be the consequences in practice of adopting the views put forward on their behalf. It happened here that the interest of the company in all the property was identical: they were beneficial owners in fee of the whole. But if the council were right, the principle for which they contended would be applicable to all cases in which any interest in contiguous land could be imported into the calculation, and the arbitrator—or it might be the jury—before being able to come to a decision, would have to embark upon an inquiry as to the nature of such interest, and in what manner and to what extent, if at all, it depreciated in the hands of the particular vendor as compared with one who had no such interest, the value of the land forming the subject matter of the contract. This would not only be highly inconvenient, and tend greatly to increase the difficulties and expense attendant on these transactions, but it would bring about some startling results, the most obvious being that it would upset all uniformity of value, inasmuch as the value of the identical piece of land in the hands of one vendor might be assessed at many times its value in that of another, and this, not from any intrinsic distinction, but by reason solely of extraneous considerations. Moreover, it would be calculated to work injustice in that a vendor compelled to sell, and who was intended by the Legislature to be compensated for being compelled to sell, might have to accept a price far less than he would have obtained from any other purchaser, and out of all proportion to the true value of the land. In his opinion, these considerations demonstrated the impossibility of accepting the argument urged on behalf of the council, and he must fix the price at the sum of £18,330 mentioned in the award.

QUERIES AND REPLIES.

[illegible] queries are replied to [illegible] nom de plume. [illegible] "X. Y. Z." and should be addressed to "The Engineer" [illegible] Surveyor [illegible].

Extraordinary Traffic over New Streets.—"Puzzled" writes: This council recently paved several new streets on a compact estate under the Private Street Works Act, 1892, but these have not yet been adopted as public highways. The east end of these streets terminates on the west side of an old occupation road to which there has never been legal access. Before these streets had been taken over and adopted by the council as the public highway authority, the erection of a new school was commenced in the field at the east side of the occupation road. The builder was requested not to use the new streets, but to keep to the occupation road, which road had previously served for the field in which the school is being erected. This he promised to do, and did, until his traffic cut up the occupation road and made it impossible, when he wrote to the council's surveyor to the effect that if the council did not repair the occupation road he would use the new residential streets. As the council could not spend public money on the occupation road, they could not comply with his request, and according to his threat he began to use the new streets, to the dismay of the frontagers who have to pay for them and looked to the council for protection. Posts were fixed at the east end of each street, but the builder pulled them out. To prevent this a rail was nailed across the ends as a barrier, but he has since sawn them down, and is continuing to use the new streets. What is the council's position, and what action do you recommend to prevent the builder using these new streets? How could we compel him to make good the occupation road over which the public have only a footpath right of way?

Although the new streets have not yet been adopted they have presumably become public highways by user. If so, the builder cannot be prevented from using them, but, on the other hand, he will be liable for expenses of repair due to extraordinary traffic thereon, conducted by him or by his order. Probably the parties employing him would also be liable. As regards the occupation road, if the builder has by his traffic rendered it less convenient for foot passengers, he can be indicted for a nuisance. (See Pratt and Mackenzie's Law of Highways, 14th edition, p. 110.)

House Drainage. New System of Sewerage.—"W. L. F." writes: An urban district council has lately carried out a new system of drainage which will sewer a district previously without a system. Many buildings at present are drained into cesspools, which were constructed in accordance with the urban council's requirements and by-laws. These cesspools are emptied when necessary by the urban council's own workmen, the cost being defrayed by the council. The council now require the buildings to be drained into the new sewers, and the question arises, who is to pay the cost of doing the work? Can the council call upon the owners to reconstruct their drains, and connect to the new sewers, or must this be done at the expense of the council?

Except with respect to such of the drains (if any) as are not of themselves sufficient for effectual drainage, the council must pay the cost of constructing new drains and connecting them with the sewers under sec. 21 of the Public Health Act, 1875. (See Lumley's Public Health Acts, 8th edition, p. 85.)

Railway Level Crossing. Obstruction of Road Traffic.—"A. R." writes: Some years ago a railway was constructed and a level crossing made near to the station, the gates being controlled from the signal-box. At the time the railway was constructed the highway was [illegible] only important one leading to a small village, and the gates could be closed for shunting purposes [illegible] periods without causing very much inconvenience. Since that time the district has developed and the station has become an important junction, where a considerable amount of shunting is done over the level crossing, and frequently the highway traffic is held up for five or ten minutes, causing very great inconvenience. Is the railway company not acting contrary to sec. 5, Railway Clauses Act, 1863? If so, who should take action?

This is undoubtedly a contravention of the section. The highway authority should take action with the concurrence of the Attorney-General. In *Attorney-General, at the [illegible] v. London and North-Western Railway Company*, 1900, 1 Q.B. 78, an injunction was granted to restrain a contravention of sec. 48 of the Railways Clauses Consolidation Act, 1845 (limiting the speed of trains at level crossings), notwithstanding that there was no evidence of injury to the public.

Private Street Works. Reserved Strip.—"Private Street" writes: A new street was laid out recently as shown on accompanying plan, and partly made up. The owners of the land reserved

a strip 2 ft. wide, between the new street and property marked A, presumably in order to prevent right of access. The street is now about to be made up under the Private Street Works Act, 1892, and the usual proceedings followed, and charges at per foot frontage will be made against the owners of the strip of land referred to. Can the owners, to avoid payment of charges, throw the strip into the roadway, thereby throwing the frontage to street work charges upon

the property marked A. This would be a contravention of the plan deposited and approved, which (power a road thus by-laws require a footway of 36 ft., and the 2 ft. strip marked A is reserved). If this were done, what remedy have the owners of property marked A in a road [illegible] as their property has already been [illegible] by the laying out of the street, and the new frontage would be useless to them?

The proceedings under the Act have reference to the new street as existing at the date of the resolution to do the works, and the owners of the strip cannot escape liability as frontagers by removing the fence between the strip and the street after the date of the resolution. Even if they had removed the fence before that date the public would not be bound to accept the strip as part of the street, and unless and until so accepted the owner would remain chargeable in respect thereof.

REPAIR OF ROAD.—L. M. [illegible] A [illegible] pany acquired a large plot of land by Act of Parliament in this district, and have since erected upon a portion of it a furnace and steel sheddings. The road is in a deteriorated condition through excessive [illegible]. Kindly say what powers an urban authority have herein.

Unless the road is repairable by the inhabitants at large the urban authority can make it up at the expense of the frontagers. But if the Private Street Works Act, 1892, has been adopted the canal company cannot be charged in respect of any land which at the time of the laying out of the street was used by them solely as a part of their canal, towing paths or works and which has no direct communication with the street. The proportion otherwise chargeable to the company must be paid by the other frontagers. Should the company afterwards make a communication with the street, they will become liable, and the frontagers will be entitled to be refunded the proportion so paid by the latter.

Glasgow "Common Good" and Housing.—The town clerk of Glasgow, Mr. John Lindsay, is of opinion that the proposal by a special committee of Glasgow Corporation that £30,000 out of the revenue of the Common Good for the current year be lent free of interest, to erect cottages at Ruddle for the working classes, is illegal. Mr. J. Avon Clyde, K.C., and Mr. M. P. Fraser, advocate, concur in this opinion. The opinion is based upon the view that the Common Good is held for the benefit of the community, and cannot, therefore, be used legally in favour of a limited number of persons.

More Money for Cheshire Roads.—Colonel Dixon, in moving the minutes of the Main Roads and Bridges Committee at the Cheshire County Council meeting last week, stated that the cost of keeping up the roads for the next year would be considerably more than previous years. They had tried to cut down expenses in every way, and they were carrying out in the county only those improvements which had already been started. Notwithstanding all their cutting down, there would be a deficit. They were not going to receive a £10,000 grant they expected from the Road Board, as all the money for the roads was to be kept on one side by the Treasury for the purpose of using it to meet unemployment. There was not much unemployment at the present moment, but there might be when the war was over.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

I [illegible] among the [illegible] supply rather [illegible] in that it [illegible] known that the particular algæ which give a slight colour and taste to water generally occur in filter-beds. [illegible] and not having [illegible] would [illegible] gone through. Is the only cure for this occurrence the emptying of the particular filters which are affected and their treatment with hot lime, or is there any other cure for [illegible]? [illegible] to the subject?

* * * *

Is it a fact that [illegible] the buildings [illegible] bombardment by shells than other buildings constructed of [illegible] brick or reinforced? Are there any authentic cases of such buildings, and [illegible] information on this subject be of great interest?

* * * *

Will [illegible] to decision [illegible] to be allowed for certain descriptions of road surfaces? Is it safe, for instance, to lay [illegible] gradient as 1 in 15? What is an allowable gradient for tar-slag? Should it be the same as for asphalt? Should there be any difference between hardwood blocks or softwood blocks? Can all classes of granite setts be laid at the same gradient? Would not a practical discussion on this question in the columns of THE SURVEYOR be of [illegible]

* * * *

Have we heard the last of the suggestion that some [illegible] should be appointed to act for the Front to advise on the question of the necessary repairs to the roads which have suffered so terribly [illegible] Has the War Office been approached on the subject from the proper quarter, and what has been the result if any representations have been made on these lines?

* * * *

When will [illegible] be issued, or when will Parliament find time to pass some Bill dealing with this important subject? Is it a fact that the only Act of Parliament dealing with this question, so far as the Metropolis is concerned, is that of the Metropolitan Streets Act of 1867? Is it also a fact that the only police notice issued under this Act is one for regulating traffic in certain specified streets, and providing that "No person shall . . . between the hours of 10 in the morning and 7 in the evening . . . drive or conduct along any street any cart, carriage, or other vehicle . . . which exceeds in length 35 ft., or which projects [illegible] more than 1 ft. from the sides of the vehicle . . . carry in any way along any street any ladder, scaffold pole, or other article which exceeds 35 ft. in length or 8 ft. 6 in. in breadth?" Is it to be conceived that this appears to be the only regulation of traffic in this mighty Metropolis? Surely after forty-[illegible] Act is [illegible]

Borough Surveyor's "Unclean" Offices.—At a meeting recently of the General Purposes Committee of the Grimsby Town Council it was reported that the borough treasurer's and borough surveyor's offices were in a very unclean condition and sadly needed cleaning and painting." It was decided that the borough surveyor should get tenders for the necessary work and report at the next meeting. A councillor remarked that it meant spending a lot more money because of the [illegible] economy practised at the first place.

Society of Engineers: Lectures to Affiliated Societies.—Following the practice established last year of giving lectures to the members of student engineering societies affiliated to the Society of Engineers, Mr. Percy Griffith, M.INST.C.E., a vice-president of the society, lectured on the 4th inst. before the Birmingham University Engineering Society on the subject of "Public Water Supplies." There was a fair attendance of students, who evidently much appreciated the lecture. The council have made arrangements for the delivery during the year of lectures to the members of other affiliated student societies.

ABERDEEN WATER.

LIME TREATMENT OF RIVER SUPPLY.

An interesting report on the subject of the water supply of Aberdeen has been prepared jointly by Mr. Cecil H. Roberts, M.INST.C.E., the city water engineer, and Dr. Matthew Hay, the medical officer, the document in question being accompanied by a report by Dr. A. C. Houston, director of water examination to the Metropolitan Water Board. The reports deal with the results of the provisional scheme as the basis of a permanent scheme for the purification of the water supply by liming, storage, and filtration, Dr. Hay and Mr. Roberts having been authorised by the town council to consult Dr. Houston in the preparation of a report on the results of the operations at Invercannie for the information and guidance of the council.

For many years, the water engineer and the medical officer point out, the only means of purification of the water supply as taken from the Dee has been the settling reservoir at Invercannie and the service reservoirs at Mannofield, Slopefield, and elsewhere in the city. These reservoirs have allowed of a certain amount of purification by sedimentation, but their main advantage has probably been in delaying the arrival of the water in the city for such time as enabled the disease-producing organisms to die out or become greatly reduced. Two filters were provided at Invercannie when the present waterworks were first constructed; but as, with the rapid growth in the consumption of water by the city, these filters had become quite insufficient to cope with the supply, they had been permitted to fall into disuse.

The present provisional purification scheme has embraced :—

(*a*) A remodelling of the existing reservoir at Invercannie.

(*b*) The modernising of the old filters and the construction of new filters.

(*c*) The construction of liming works.

PROVISIONAL WORKS.

A gauge has n has been constructed on the line of the aqueduct between the intake and the settling reservoir. In this basin the whole water supply passes over and is measured by a rectangular weir, and the lime water previously prepared in the adjacent liming plant is added to the water.

The existing circular settling reservoir, having a capacity of 12,000,000 gallons, has been altered by the construction in its basin of a helical reinforced concrete baffle wall, designed to prevent short-cutting of the water from the inlet to the outlet, and thus to secure more completely the storage effect of the full capacity of the reservoir.

The two original and disused sand filters have been reconstructed on modern lines, and three new and additional sand filters are in course of being completed. The total area of filtration will now be about 2 acres, with a depth of fine sand of 3 ft. . . .

BACTERIOLOGICAL EFFECT OF LIMING.

With the view of reducing as far as possible the amount of free lime in the water as supplied to the consumer, and of limiting the increase of hardness due to lime, we have endeavoured, among other points, to ascertain whether a less amount of lime than that tried in 1913—namely, 3 parts per 100,000 parts of water—would suffice in practice to destroy the bacillus coli.

It has recently been suggested by certain authorities in the United States that, provided sufficient time is allowed, the bacillus coli in water can be killed by an addition of lime sufficient to neutralise the carbonic acid and bicarbonates in the water, and that no excess free lime is necessary. The Aberdeen water requires usually somewhat less than 1 part of free lime to 100,000 parts to effect neutralisation. From laboratory experiments made in the spring of 1914, with no excess free lime and with a very minute excess (0·1 to 0·2 parts of CaO per 100,000) we obtained results that appeared to support the American view. But when these results were applied at Invercannie, first, by adding 1 part of lime (including the lime necessary for neutralisation), and, subsequently, 1½ parts per 100,000 to the whole water supply as it entered the reservoir, the action of the bacillus coli was found to be unreliable as tested at the outflow from the reservoir. At this time the reservoir had not been remodelled, and probably short-cutting of much of the water was taking place and was preventing the water having sufficient time to act on the bacillus. For, unless the lime is present in great excess, the destruction of the bacillus is never immediate. Tests of the water at the city were not conclusive, as it is known that there is a considerable percolation of subsoil water into the aqueduct in its course to the city, owing to its faulty condition.

The proportion of lime added was raised to 2 parts, but we thought it futile to make any further tests at the reservoir until it had been remodelled by the introduction of a helical baffle. The remodelling was begun at once, and was finished at the end of July. . . .

For about three weeks, commencing on August 11th, the amount of water passing through the reservoir at Invercannie was reduced to about one-seventh of the total supply, the remainder being allowed to proceed direct to the city; and the flow of the water through the reservoir was so regulated as to occupy about seven days, thus representing experimentally the period for which it is intended the whole water supply will be detained in the reservoirs at Invercannie when the reservoir accommodation is increased to the extent proposed under the permanent scheme referred to in the joint report by the water engineer and Mr. C. P. Hogg in May, 1913. About 2 parts of lime continued to be added to the whole supply, as had been done since the spring. Tests for bacillus coli were made twice weekly of the water before liming and of the limed water as it left the reservoir. Although the bacillus was present fairly abundantly in the raw or untreated water—being found on an average in about 1 cub. cent.—it proved to be invariably absent from the water leaving the reservoir.

It was intended to go on to test the effect of reducing the proportion of the lime, but it was thought advisable not to run any risk by reducing the lime, as at this time the larger of the two Mannofield reservoirs was out of action for the purpose of being roofed, and its storage effect in assisting the action of the lime on the percolating water of the aqueduct was being lost. It was considered desirable to give the water supply such advantage in storage as could be obtained from passing the whole of it through the Invercannie reservoir. This meant, for the whole supply, about one day's storage at the level at which the reservoir then stood. The tests for bacillus coli were, however, continued, and it was satisfactory to find that, even with a storage or contact of the lime with the water for only one day, the effluent water from the reservoir contained no bacillus coli, although repeatedly examined. This was a much better result than was obtained from the reservoir outflow in 1913, when 3 parts of lime were being added, but when the reservoir had not been remodelled.

This excellent result with about 2 parts of lime and one day's storage serves to justify the hope that, with the remodelled reservoir and a seven days' storage, the lime in actual practice might, as in the laboratory experiments already mentioned, be reduced, without loss of efficiency, to a proportion very slightly in excess of the amount required for the neutralisation of the bicarbonates, with, consequently, very little free lime to be subsequently carbonated. But, for the reasons just stated, we were for the time deterred from making any further experiments in this direction at Invercannie. It is probable that the lime can be reduced to, say, 1·5 parts (about 1 grain per gallon), and possibly further, depending on the amount of bicarbonates in the water, which varies somewhat. Dr. Houston is also of this opinion. . . .

HARDNESS.

The addition of lime to a water of such natural softness as the Dee water will increase its hardness. The total hardness of the Dee water is equivalent to about 2 to 3 parts of $CaCO_3$ per 100,000 parts, or about 1½ to 2 Clark degrees. Analyses of the treated water after leaving the Invercannie reservoir show that, with 2 parts of lime per 100,000 added to the water before entering the reservoir, the hardness of the water as delivered in the city is raised to about 3½ to 4 Clark degrees, which would still leave the Aberdeen water within the category of soft waters as ordinarily defined.

Some addition to the hardness of the Aberdeen water supply will, in certain respects, be an advantage, as in serving to prevent the considerable corrosion that takes place at present in the iron water pipes.

FILTERS.

A series of weekly bacteriological tests were made in August and September of the efficiency of the first-

Things One Would Like to Know	297

completed filter, which by that time had been in action for several weeks previously. The tests extended over the period when first one-seventh of the water supply was being treated in the reservoir, and later when the whole supply was being treated. The water from the reservoir was being run through the filter at the rate of 8 in. an hour—the rate proposed for the whole water supply. This rate is about twice the rate in more common use, but is accepted in some places as sufficient, even where no additional purifying process, such as liming, is in operation. There was little scope left for the action of the filter, as the bacillus coli had already been destroyed, and, except at one of the tests, the ordinary germ count on gelatine cultures of the water leaving the reservoir was already well under the 100 per cub. cent. laid down by Koch as satisfactory for a filter effluent. The filter did not appear to have much effect, possibly owing, in some measure, to the multiplication of harmless bacteria which takes place in the underdrains in most filters. As no bacillus coli remained in the limed water as it left the reservoir, there was none to be removed by the filter. In an earlier experiment, however, made before the reservoir was reconstructed, and while bacillus coli was present in the effluent of the reservoir, the bacillus coli was wholly removed by the filter during the later part of an experiment that continued for about a month.

The knowledge as to what modern sand filters can accomplish is so well established that no doubt can be entertained as to the efficiency of the Invercannie filters when all the works are completed and the filters are in full operation.

It is conceivable that the presence of free lime in the water may interfere with the proper formation of the organic film on the filter surface, which is usually regarded as the most active part of the filter in the removal of organisms. If so, this interference can, of course, be prevented by the carbonation of the lime before the water reaches the filter.

The effect of the filter in clarifying the water and in removing all suspended matter was well marked.

COLOUR.

Both the liming treatment of the water in the reservoir for seven days and the subsequent filtration had considerable influence in diminishing the colour of the water when the colour was high; but there was little effect when the colour was low.

CONCLUSION.

In his report Dr. Houston expresses full confidence in the merits of the liming process and approves generally of the whole scheme of purification.

It is in view, if the results of the provisional scheme are approved by the town council as the basis of a permanent scheme for the purification of the water supply, that it will be possible, with a large increase of the reservoir storage at Invercannie, together with some further increase of the filter-beds, to provide a triple or threefold system of purification by (*a*) liming, (*b*) storage, and (*c*) filtration, as compared with a commonly practised twofold system of storage and filtration. It is believed that the introduction of liming, which is in itself effective in the removal of disease-producing organisms, and is at the same time an inexpensive method of purification, and easily capable, by variations in the amount of lime, of being strengthened or moderated as may be required from time to time to meet exigencies, will justify a scheme of purification in which the means for storage and filtration, both of which are very costly to provide, may be considerably less extensive than would be necessary if liming were omitted, and in which the three means of purification would yet be so balanced that should, through accident or neglect, any one of them temporarily fail, the remaining two would afford, in ordinary circumstances, adequate protection.

COST OF SCHEME INCLUDING LIME TREATMENT.

ESTIMATE.

First Instalment for 8 Million Gallons per Day.

Improvements at intake	£12,000
Liming plant, buildings, &c.	6,200
Storage and settling reservoir	72,550
Filters	23,000
New aqueduct and repairing existing aqueduct	205,000
Extensions at Culls pumping station	11,300
New service reservoir and connections	22,200
	£352,250
Contingencies 15 per cent	52,750
	£405,000
Land, easements, repairs to roads, &c.	20,000
	*£425,000

Second Instalment for further 1½ Million Gallons per Day.

Liming plant	£500
Filters	4,000
Pumping plant	4,600
Reservoirs	13,100
	£22,200
Contingencies	3,200
	£25,400

CECIL H. ROBERTS,
City Water Engineer.

* NOTE.—The cost of the provisional purification works at Invercannie—viz., £28,700—which has already been mostly expended, is included in the sum of £425,000.

At its meeting last week the Water Committee of the Aberdeen Town Council unanimously agreed to recommend the promotion in Parliament of a Bill empowering the corporation to carry out the proposed works.

Town Planning Institute.—"The Economics of Town Planning in Relation to Land Development" is the title of a paper which Mr. G. L. Pepler, F.S.I., will read at a meeting of the Town Planning Institute to be held this evening at 92 Victoria-street, S.W. The chair will be taken at 8 o'clock.

The Art of House Planning.—In the course of a recent lecture at Birmingham University on "Town Planning and Civic Design," Mr. Barry Parker demonstrated the interdependence of the house plan upon the plan for the lay-out of the ground, and the plan for the lay-out upon the type of house plan proposed to be used. He pointed out that by carefully planning each house so as to make the fullest use of the advantages the site offered, architects could do a great deal to advance the art of house planning. He referred to the advantages of the terrace house over the detached house in districts where the frontage was necessarily limited, and added that the detached house in the suburbs had always been one of the most difficult things the town planner had to deal with in his endeavours to get some sense of unity and quiet dignity in such districts.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

Mr. E. W. Pugh, of Southampton, selected the following books in respect of the January premium, which was awarded to him:—

"Elementary Principles of Reinforced Concrete Construction," by E. S. Andrews (Scott, Greenwood & Son), and

"The Testing of Materials of Construction," by W. C. Unwin (Longmans).

These have been duly forwarded to him.

QUESTIONS.

This week answers are invited to the following questions:—

457. Hydraulics.—A common formula for the mean velocity of flow in streams and artificial channels is $v = c\sqrt{mi}$. Explain carefully the meanings of the various factors on the right-hand side of the expression, and state how the values of c for various kinds of channels have been determined.

459. Sewage Sprinkler.—Describe an efficient form of sewage sprinkler for percolating filters which requires very little head of sewage to work it. (J. R. H., *Ipswich*.)

460. Sewage Sea Outfall.—Are reinforced-concrete pipes better than cast-iron pipes for a sewage outlet into the sea, which is covered at high water? Compare them as regards initial expense and maintenance. (J. R. H., *Ipswich*.)

461. Applied Mathematics.—Give some simple examples of the application of the calculus to the solution of practical engineering problems. (Student.)

462. Projectiles. Establish a formula for determining the angle at which a projectile should be discharged to secure the maximum range. (T. R.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

456. Strength of Materials.—A rectangular beam is loaded by a weight at its centre. How will the deflection be changed by (*a*) doubling the span, (*b*) doubling the width, (*c*) doubling the depth, (*d*) doubling the load?

It is assumed that the beam is of uniform cross-section throughout its span, and that the ends are merely supported. The formula for this case is:—

$$\text{Deflection} = \frac{a\,W\,L^3}{E\,I}$$

where W = the load

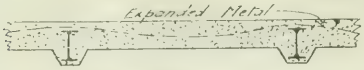
L = the span

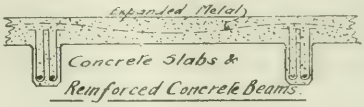
E = Young's modulus for the material of the beam in question

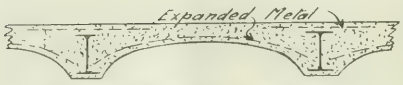
I = the moment of inertia of the beam

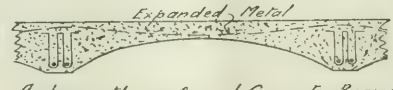
a = a constant, depending on the method of loading and the fixing of the ends.

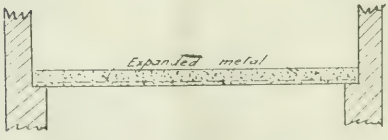
Since in this case W is a concentrated load acting at the centre, and the ends of the beam are

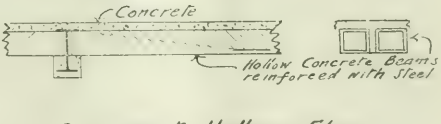












Sketches of Fireproof Floors.

suggested. [illegible] A [illegible] a rectangular [illegible]

$$I = \frac{BH^3}{12}$$

where H is the height and B the breadth [illegible]

Assuming that [illegible] provided [illegible] the formula we have as before

$$\frac{W \cdot 2 L^3}{48 E I} = S\left(\frac{W L}{48 E I}\right)$$

The [illegible] doubled [illegible] produce a deflection [illegible]

The deflection produced by doubling the width is stated to be that is

$$\frac{W L^3}{48 \times 2 E \frac{BH^3}{12}} = \left(\frac{W L}{48 E I}\right)$$

Thus the effect is doubling the width is to halve the amount of deflection.

When the depth is doubled, we have as the formula

$$\frac{W L^3}{48 E \frac{B(2H)^3}{12}} = \frac{1}{8}\left(\frac{W L}{48 E I}\right)$$

[illegible] is equivalent [illegible] When the [illegible] doubled [illegible]

$$\frac{2 W L^3}{48 E I}$$

From the foregoing [illegible] the theorem (E. K. Y.)

458. Fireproof Construction. [illegible] some good [illegible] fireproofing [illegible] a warehouse.

The diagrams [illegible] to these questions.

PRIVATE BILLS.

QUESTION IN THE HOUSE.

In the House of Commons on Wednesday Mr. [illegible] asked the Prime Minister if he [illegible] time during the present Session for Private Bills [illegible] the Second Reading [illegible] Bill [illegible] defeated in the House after much labour and expenditure of money in the Committee Room [illegible] Bills [illegible] Bill [illegible] promoters of such Bills and the waste of time of the Committees.

The Prime Minister [illegible] the question to [illegible] Mr. Asquith answered in the [illegible] Bills raised questions of a public character, and of [illegible] the Government would [illegible] such a power to grant further progress. Mr. Heath would say that he did not include Bills [illegible] a private nature and domestic to the Bill. It was, of course, not easy, *prima facie*, to determine whether a particular Bill was or was not of the latter description; but where [illegible] Second Reading debate, and he was sure the House would be disposed to [illegible] the very [illegible] would probably be [illegible] Committee of Ways and Means.

Billeting and the Expenditure of Local Authorities.

On Wednesday, in the House of Commons the Under Secretary of State for War was asked whether he was aware that in many parishes where troops had been encamped or billeted additional expenditure by the local authorities had been rendered necessary in respect of sanitation and other local services to meet which increases in rates had been imposed; and whether it was the intention of the Government to make good to the local authorities the amount of expenditure so occasioned. In reply Mr. Baker said the question of making good to local authorities expenditure of this character was considered in October last, and instructions were then issued to all General Officers Commanding defining the extent to which it might be defrayed from Army funds.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyors [illegible] with a view to making the information given under this head as complete and as prompt as possible.

INQUIRIES HELD.

Abertillery U.D.C. [illegible] February 9th. Mr. [illegible] Whitley [illegible] Mr. [illegible] Mr. [illegible] Mr.

the purposes of a fire brigade station of certain property in Rendham-road.—The surveyor, Mr. J. E. Hattersley, in answer to the inspector, said that when the new water supply was provided there would be sufficient pressure to deal with all fires in the town without the use of the manual engine they had at present. The inspector asked if the outstanding debts included the loan for the water supply which had been sanctioned but not yet raised. The clerk: That is practically the only debt we have. The inspector: The only reason I am here is that the board was under the impression that the debt was greater than the assessable value, which made an inquiry a statutory necessity. If it had not been for that I would not have come at all. We should have granted the loan at once.

Worksop U.D.C. (February 3rd. Mr. M. K. North).—£2,180 and £520 for road improvements in Gateford-road and Retford-road respectively.—The surveyor, Mr. George Rawson, stated that the improvements were rendered necessary by the development of the town.

APPLICATIONS FOR LOANS.

Ashton-under-Lyne T.C.—£15,675 for school buildings.

Dartford U.D.C.—£7,510 for a housing scheme, £1,700 for street improvements, and £400 for park extensions.

Dublin T.C. £6,000 for the improvement of Lower Liffey-street.

Dunmow R.D.C. £150 for sewer extension.

Kiveton Park R.D.C.—£127 for water-main extension.

Lincoln T.C.—£4,000 for a new school.

Middlesbrough T.C.—£3,000 for water mains.

Morecambe T.C.—£10,000 for golf links and the extension of the promenade.

Radcliffe U.D.C.—£2,604 for road improvements.

Warrington T.C. £18,250 for the purposes of the gasworks.

LOANS SANCTIONED.

Acton U.D.C.—£1,889 for road widening.

Barnsley R.D.C.—£700 for a water main.

Bournemouth T.C.—£2,730 (repayable in twenty years) and £5,070 (repayable in ten years) for works of wood paving in Holdenhurst-road.

Caerphilly U.D.C.—£175 for sewerage works.

Carrickmacross U.D.C.—£700 for the completion of the housing scheme.

Edmonton U.D.C.—£5,967 for street widening.

Grays U.D.C.—£1,483 for surface-water drainage works.

Hammersmith B.C.—£10,000 for electricity mains, plant, house services, and meters.

Holmfirth U.D.C.—£7,500 for the electricity undertaking.

Ince U.D.C.—£17,700 for a sewage disposal scheme.

Irvine T.C.—£11,050 for the erection of workmen's houses.

Loughrea R.D.C.—£8,250 for a sewerage scheme.

Prestwich U.D.C.—£20,515 for the construction of the Deyne Valley intercepting sewer.

Stratford-on-Avon T.C.—£646 for a new road.

Watford R.D.C. £950 for the erection of workmen's houses.

HOUSES FOR DOCK WORKERS.

PORT OF LONDON AUTHORITY'S SCHEME.

At Prince Regent's-lane, Plaistow, the Port of London Authority has initiated a housing scheme for dock workers which, as being a pioneer movement, is likely to have an important influence upon housing plans taken in hand by public authorities in the future.

The scheme is the immediate outcome of the huge extensions of the Port of London sanctioned by Parliament a few years ago. This comprised the extension of existing docks, and the construction of new ones. In all, the cost bore an initial estimate of £15,000,000; but before its completion is reached this figure—big though it is—may easily be exceeded. Such a large scheme could not be carried out in the Metropolitan Dock district without disturbing existing housing accommodation, and is bound to be accompanied by a demand for new housing room by those who will find permanent employment in the new docks, the first section of which, at a cost of £4,000,000, is now in course of construction. To meet these necessities the Port of London Authority has put this pioneer scheme in hand.

The plans now decided upon provide for 204 houses, giving accommodation to about 1,000 persons. In the original plans 164 houses were arranged for; but forty houses have been added, because it was found necessary to rehouse families at North Woolwich whose residences are being demolished. Street and sewering work is now well in hand, and the construction of the houses and the general laying-out of the estate upon Garden City lines will be carried out as quickly as possible. When completed, just over twelve months hence, this colony of 204 houses will constitute the first model Dockers' Garden Suburb in the kingdom. The houses will contain three, four, or five rooms. The surrounding and intersecting roads are 40 ft. wide, with frontages to the houses of 15 ft. A bath is provided in each house. In front and rear garden plots are provided for.

While the White Hart-lane estate of the London County Council accommodates twenty-six persons to the acre, the Prince Regent's-lane estate will contain only twenty-two houses to the acre. The rents are not yet fixed; but they will be similar to those charged for similar house-room in the locality, and preference is to be given to persons who are being dishoused as a result of the Port of London extensions.

Running Costs of Motor Vehicles.—A paper on this subject will be read before the Society of Engineers on Monday, March 1st, by Lieut. Robert W. A. Brewer, Assoc.M.Inst.C.E., A.M.I.Mech.E. The meeting will be held at the Institution of Electrical Engineers, and the chair will be taken at 7.30 p.m.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the most important projected works of which particulars appear below: Building.—Plymouth, Stoney, Bromley and Town planning.—Finchley, Southam and Pembroke roads and materials.—Fleetwood, Kensington, Rubble crushers.—Swinton and Pendlebury, Hunslet, Wrexham, water, gas and electricity.—Perth, Prestwich, Tredegarpe.—Particulars of other projected works will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Acton U.D.C.—The council propose to widen the railway on each side of the bridge at Friar-street and upon the suggestion of the surveyor, Mr. F. Sebert, negotiations are to be opened up with the railway company with respect to the widening of the bridge.

Blackpool T.C.—The council have submitted plans to the Local Government Board for a sanatorium at Staining.

Blairgowrie T.C.—Consideration is being given to a proposal for alterations to the public hall.

Carlisle T.C.—A scheme has been approved for the erection of a technical school.

Ealing T.C.—The borough surveyor, Mr. W. R. Hicks, has received instructions to prepare plans for a school to be erected on St. Mary's allotments.

Newcastle-on-Tyne T.C.—At a meeting of the Estate and Property Committee, a communication was read from the Local Government Board desiring to be informed why the corporation proposed to proceed with the erection of three new baths, at a cost of £29,000, at the present time, contrary to the opinion expressed by His Majesty's Treasury respecting the expenditure of public money during the war.

Plymouth T.C.—Messrs. Thornely, Beedle & Barron, architects, have received instructions to prepare plans for the extension of the asylum at Blackadon. The estimated cost of the work is £[illegible].

Shrewsbury T.C.—A scheme has been agreed to for the addition of a block to the isolation hospital.

Stepney B.C.—Another step has been taken in connection with the proposed new municipal buildings, it having been agreed to issue an advertisement for suitable designs. No guarantee is given that the council will proceed with the erection of the buildings within a definite period.

Westhampnett R.D.C.—With regard to the proposal for substituting steel bridges for the existing bridges which cross the Chichester Canal at Donnington and at Birdham, the Road Board have written that they regretted they were unable, at the present time, to encourage the authorities concerned to make an application for a grant from the Road Improvement Fund towards the expenditure proposed, nor any applications in respect of works such as the construction of bridges, for which the money could be borrowed from outside sources, and the repayments spread over a considerable number of years.

HOUSING AND TOWN PLANNING.

Bridgwater R.D.C.—The surveyor, Mr. W. A. Collins, has prepared amended estimates for the housing scheme, and the council have applied to the Public Works Loan Commissioners for a loan of £854 for the purchase of land and the erection of cottages.

Dublin T.C.—Tenders are to be invited for the erection of workmen's houses in Church-street, Beresford-street, and Trinity Ward.

Finchley U.D.C.—It has been agreed to build 100 workmen's houses at North Finchley.

Glasgow T.C.—The city council are giving consideration to a scheme prepared by the master of works, Mr. A. B. McDonald, for the erection of workmen's dwellings at Govan.

Holmfirth U.D.C.—It is intended to carry out a housing scheme at an estimated cost of £3,285.

Newton Abbot U.D.C.—A committee has been appointed to prepare a scheme for the erection of twenty workmen's dwellings.

Penzance T.C.—The tender of Messrs. H. [illegible] & Sons, of Crowan, at £4,946, has been accepted for the erection of twenty-two workmen's houses.

Swinton and Pendlebury U.D.C.—Approval has been given to a scheme for the erection of workmen's dwellings, at an estimated cost of £7,400.

Torrington T.C.—A tender has been accepted for the erection of [illegible] at a cost of £1,027.

PARKS AND OPEN SPACES.

Morecambe T.C.—The council have approved a scheme prepared by the borough surveyor, Mr. F. W. Hipwood, for laying out golf links.

REFUSE COLLECTION AND DISPOSAL.

Bournemouth T.C.—Provision is to be made in the [illegible] for the removal of house refuse.

ROADS AND MATERIALS.

Acton U.D.C.—It has been resolved to meet the Hammersmith Borough Council by paying part of the purchase of the land and the works, to the extent of £315, in connection with the construction of the proposed new road connecting Old Oak Common-lane with Old Oak Common.

Brighton T.C.—The Improvements and Highways Committee recommend that an improvement be carried out at the Grand Parade, at an estimated cost of £[illegible].

Cuckfield R.D.C.—It has been decided to obtain 2,700 [illegible] of tarred stone; and about 1,500 tons of Groby, Mountsorrel and Croft granite; also 180 tons of screenings from Messrs. Read & Sons, Dinogar Quarries, and to accept tenders for 300 tons of dug flints and for 70 tons of Portfield gravel.—The council have confirmed the action of the highways surveyor, Mr. W. McArthur, in accepting ninety barrels of tar from the Haywards Heath Gas Company for next season's work at 6s. [illegible].

Epsom R.D.C.—It has been decided to widen portion of Barrdon lane at an estimated cost of £200.

Exmouth U.D.C.—The tender of Messrs. Wilkinson & Co., at £[illegible], has been accepted for the second section of the Marine-drive improvement, subject to the sanction of the Local Government Board being obtained to the substitution of reinforced concrete piles for wood piles.

Fleetwood U.D.C.—The surveyor, Mr. E. Frobisher, has prepared a scheme of foreshore improvement which is estimated to cost from £15,000 to £20,000.

Harwich T.C.—The council have approved the scheme of the borough surveyor, Mr. F. H. French, for making up Clarke's-road, Dovercourt.

Hythe T.C.—The council have submitted to the county council a scheme for treating certain roads with Tarmac, at an estimated cost of £[illegible].

Isle of Wight R.D.C.—The council have agreed to a scheme for [illegible] and repairing the road leading from Freshwater to Chale. The surveyor stated that the Road Board would repay the council the whole of the cost incurred, and advance the money by instalments as required, and that he had been asked to include in his estimate 2½ per cent for the use of plant and tools, 5 per cent for contingencies and drainage, and 5 per cent for supervision and establishment expenses. After completion of the work no future liability would rest on the council for the maintenance of the road.

Kensington B.C.—The Works Committee recently reported that they had given further consideration to the wood-paving question, and had had before them a report by the borough engineer, Mr. A. R. Finch, in which he stated that, having made a survey of the whole of the wood paving in the borough, he had come to the conclusion that for the next four years the following might be regarded as a conservative estimate of the probable expenditure of the council on wood paving renewals, if the borough standard of wood-paved surfaces is to be maintained: For the year 1915-16, £20,440; 1916-17, £17,223; 1917-18, £19,220;

and 1918-19, £24,143. It was recommended that the following roads should, if possible, be renewed during the ensuing financial year: Brompton-road, from the Bell and Horns public-house to the borough boundary by Hoopers-court, estimated cost £8,100; Young-street, £1,900; and Holland-road, £12,150. The matter has been referred back to the committee for the purpose of deleting Holland-road.

Kidderminster T.C.—It is proposed to make up the streets in the added area, at an estimated cost of £12,000.

Lancs C.C.—The Road Board have approved of thirty-four schemes of road improvement in the county, suitable to be put in hand when relief work were required in the various districts.

Leyburn R.D.C.—The Road Board have sanctioned a grant of £200 towards the cost of widening the road to Downholme.

Limerick C.C.—The Local Government Board have written to the council in connection with the lack of money for the maintenance of main roads, stating that the board would approve of the expenditure of £1,500 on such work. The council have agreed to accept the offer.

Maidstone T.C.—The corporation have purchased 25,000 second hand Jarrah wood blocks for paving their High-street tramway.

Manchester T.C.—The Paving Committee have received the council's authority to effect private street improvements at a cost of £402.

Morecambe T.C.—A scheme for the extension of the promenade and also the tramway system has been approved.

Northumberland C.C.—It has been decided to carry out improvements to a large number of dangerous corners in the county, at an estimated cost of £7,168, subject to a grant being obtained from the Road Board.

St. Pancras B.C.—A grant of £1,868 has been received from the Road Board in respect of the cost of wood paving in Leighton-road. This amount brings up the board's contributions to £4,868, out of a certified cost of £5,162.

Sheffield T.C.—It is proposed by the Improvement Committee to acquire property in Exchange-street and Furnival-road for widening purposes, at a cost of £14,900.

Stoke-on-Trent T.C.—The scheme for widening and diverting Stonecroad is to be carried out at an estimated cost of £2,483.

Tipton U.D.C.—The surveyor, Mr. W. H. Jukes, has submitted to the Road Board certain schemes, including a proposal to tarspray a much larger area of the main roads than heretofore. He has also submitted an estimate for strengthening the foundations of No. 2 main road from Dudley Port Station to the parish boundary at Great Bridge, 1,353 yds. in length, the total estimate for the work being £1,738. It is proposed to take off the present metal and screen it for re-use, and then to excavate the whole of the carriageway to a depth of 16in. A foundation of under pitching, 9 in. deep, is to be put in, and then 3 in. of broken slag, and the top 4in. to be of granite metal in two sizes. This, when completed, will, the surveyor considers, make a first-class permanent road.

Westhampnett R.D.C.—The tender of Messrs. Rowe & Mitchell, London and Guernsey, has been accepted for the supply of 2,200 tons of 2-in. Guernsey granite at prices ranging from 11s 5d to 16s 9d per ton according to place of delivery.

SEWERAGE AND SEWAGE DISPOSAL.

Atherstone R.D.C.—Negotiations are in progress for the purchase of 5½ acres at Baddesley for sewage disposal purposes.

Elgin C.C.—Mr. Doig, engineer, is preparing a scheme for the disposal of the sewage of New Elgin.

Ellesmere U.D.C.—The Local Government Board having inquired what steps are being taken with respect to sewage disposal, the council have referred the matter to the General Purposes Committee.

Galashiels T.C.—A statement was submitted recently showing that the cost of the drainage and sewage disposal scheme was £70,753. The principal items were: Messrs. Shanks & M'Ewen, contractors, £47,000; engineers' fees and outlays, £4,684; Messrs. Thos. Hill & Co., £4,621 (purchase price of cement), £4,250.

Harrogate T.C.—The council have decided upon a scheme for the duplication of the 21-in. and 24-in. syphons in connection with the south main outfall sewer, at an estimated cost of £5,530.

Hebburn U.D.C.—It has been agreed to carry out sewer extensions at an estimated cost of £772.

Midsomer Norton U.D.C.—A notification having been received from the county council of their intention to take proceedings against the urban council under the Rivers Pollution Prevention Acts, a committee has been appointed to consider the question of an improvement in the method of sewage disposal.

Norwich T.C.—It has been decided to purchase a Rees Roturbo pump, electric motor, and motor starter, for the sewage works, at a cost of £76.

Wrexham R.D.C.—A scheme for the drainage of the new garden suburb at Gresford is to be carried out at an estimated cost of £3,900.

WATER, GAS, AND ELECTRICITY.

Basford R.D.C.—The clerk has been authorised to approach the Local Government Board with a view to extending the Cossall water supply to Newton Bridge.

Battersea B.C.—The Electricity Committee recommend the council to give effect to the proposal of the electrical engineer for an extension of the equipment at the generating station, and the provision of other machinery. They also suggest the desirability of linking up the electricity undertaking with that at Fulham.

Bourne R.D.C.—It has been agreed to instal at the new isolation hospital a system of "Cox's air gas," which was stated to be cheaper at an installation cost of £200 than a supply of coal gas from the Bourne gasworks.

Chichester T.C.—Objection having been raised to the recommendation of the Lighting Committee that the council should claim the standards under the electric light contract at the end of the year, it was explained by the chairman of the committee that the terms of the agreement enabled the council to claim the columns and lamps "if the corporation so desired," and the time had arrived, in the opinion of the committee, when it would be an advantage to decide that the columns should become the property of the corporation, because they were new and up-to-date, and convertible for gas or electricity, and because they would be able to get a lower tender for street lighting by having their own standards. Some 320 standards at £2 each were included in the previous tender, and whoever had the tender after December 31, 1915, the cost would be at a lower rate. In addition, they did not wish to have the pavements disturbed. The council approved the recommendation.

Hackney B.C.—It has been resolved to link up the electricity undertaking with that of the Poplar Borough Council, at an estimated cost of £2,720.

Hull T.C.—The nett profit of the water undertaking last year was £18,862.

Llandudno U.D.C.—A scheme has been approved for the extension of the gas-making plant at an estimated cost of £7,600.

Midsomer Norton U.D.C.—The surveyor, Mr. C. H. Sunderland, reported lately that he had gone into the question of lighting the street gas lamps wholly by hand and partially by hand and controllers. The cost of lighting the lamps for the lighting season 1913-14 was £34 17s 11d (exclusive of the cost of gas and repairs to lanterns). To light the whole of the gas lamps by hand at the present rate paid would be £45.

Perth T.C.—It has been decided to instal a new turbo-generator at the electricity works, at an estimated cost of £6,000.

Prestwich T.C.—Consideration is being given to a proposal for the provision of increased water storage and filtering.

Tanderagee U.D.C.—The council are considering in committee a report by Messrs. Swaine & Considine, consulting engineers, recommending a scheme of water supply from the Glenoran springs, at an estimated cost of £5,000.

Thakeham R.D.C.—In connection with the Storrington water supply scheme the council have accepted the tender of Messrs. William Moss, Loughborough, at £2,403, for the construction of the reservoir and

...ing the house, the tender of the Stanton Ironworks Nottingham, at £1,221, for iron material and the tender of Tangye, Limited, Birmingham, at £56, for the supply of oil engines and pumping plant.

Torquay T.C.—The following tenders have been accepted for new plant at the generating station: Motor-driven sea-water pump, Messrs. Rees Returbo Company, £248; overhead travelling crane, Messrs. Herbert Morris, Limited, £184; all steel work in connection with the coal transporter at the works, Messrs. T. L. Harding & Sons, £95; all switchgear, the British Thomson Houston Company, £1 464.

Upton U.D.C.—The tender of Messrs. Childs & Withers, at £5,915, has been accepted for the Upton-on-Severn water supply scheme.

MISCELLANEOUS.

Truro R.D.C.—Upon the suggestion of the surveyor for the Northern Division, Mr. S. Gilbert, it has been agreed to ask the Local Government Board to sanction borrowing out of rates by the council.

Plymouth T.C.—The council have accepted the tender of the British Electrical Engineering Company for the supply of six motor cars and trailers at £750 each, and that of the British Westinghouse Electric and Manufacturing Company for the electrical equipment of the cars, and application is to be made to the Board of Trade for sanction to borrow £4,500 for the purchase of the cars.

PERSONAL.

Mr. Thomas Scott, Old Cumnock, has been appointed burgh surveyor of Dunbar.

Mr. Walter Hine has been elected [illegible] engineer to the Ramsbridge Rural District Council.

Mr. C. V. Drummond has been appointed by the London County Council as district surveyor for Bermondsey.

Mr. Arthur W. Kemp, a well-known and popular figure in road motoring circles, has been appointed [illegible] of the Hendon Motor Construction, Limited.

Messrs. J. Bass, H. West, J. C. Tanner, H. Whittaker, P. J. Purchase, and F. G. Pitts, of the Herts county surveyor's staff, are each to receive part of a sum of £300 voted by the county council for special services rendered or to be rendered during the illness and absence of the late county surveyor.

Mr. Sherard Cowper-Coles, M.I.Mech.E., M.I.E.E., has been elected a vice-president of the Society of Engineers, filling the vacancy caused by the death of Mr. T. E. Bower last year; and Mr. Burnard Geen, Assoc.M.Inst.C.E., has been elected a member of council in place of Mr. Cowper-Coles.

Lieutenant W. Crabtree, of the 8th (Service) Battalion Lincolnshire Regiment, who died as the result of a motor accident near Tring recently, was the only son of the late Mr. W. H. R. Crabtree, a former borough surveyor of Doncaster, and nephew of Mr. W. R. Crabtree, surveyor to the Doncaster Rural District Council.

Second Lieutenant Richard Twelvetrees, A.M.I.Mech.E., A.M.Soc.E. (France), was gazetted Lieutenant on January 20th last. Lieutenant Twelvetrees, who is a staff officer in the Mechanical Transport branch of the Army Service Corps, has been on active service with the British Expeditionary Force since last October.

Mr. G. A. Hart, sewerage engineer, Leeds, on the 12th inst. delivered the second of a series of two Friday evening lectures on the municipal undertakings of that city, arranged in connection with the local Philosophical and Literary Society. The subject of the lecture was "Sewage Disposal." Tonight Mr. W. T. Lancashire, the city engineer, will speak on "Town Planning."

Mr. A. T. Walmisley, M.I.M.E., at the invitation of the Committee of Management of the International Engineering Congress, 1915, to be held at San Francisco, has written the twelfth article of a series on "Materials of Engineering Construction" which is being published in connection therewith. The subject he was specially asked to deal with is the "Use of Iron and Steel Structures."

Mr. Michael Murphy, [illegible] borough surveyor of Dublin, recorded a [illegible] on the occasion of a complimentary gathering at the Dolphin Hotel, at which a large party representative of all departments of the corporation employees assembled. A resolution of congratulation was passed to him on the proposition of Mr. Henry Allen, seconded by Mr. Howe, and Mr. Moynihan replied in appropriate terms. Though having first claim to preferment, Mr. Allen had, said Mr. Moynihan, waived it in favour of himself.

THE CARE OF ROADSIDE GRIPS.

DAMAGES FOR PERSONAL INJURIES.

At the Petersfield County Court on Monday, his Honour Judge Gye delivered judgment in the case of Ann Masters, of Causeway Farm, Horndean, against the Hampshire County Council, which had been heard at three previous sittings, two at Petersfield and the last at Winchester on December 23rd. The action was brought by the wife of a farmer who broke her leg on March 3rd in consequence of falling into a grip by the side of the road near the tramway [illegible] at Horndean. She claimed £40 from the county council, the road authority in the district in which the accident occurred, alleging that the defendants were guilty of a breach of their statutory duty, and were negligent by permitting the grip to be overgrown with grass.

His Honour remarked that several decisions dealing with the question at issue were cited on both sides. He had carefully considered all these, but he thought that it was sufficient to refer specifically to one of them only—viz., the *Borough of Bathurst* v. *Macpherson*, in which the law on the point was very fully considered. Following the judgment of their lordships in that particular case, he had no doubt that upon applying what was there laid down the plaintiff was entitled to recover damages from the defendants in respect of the injuries which she sustained. He found as a fact that the defendants were clothed with the duty to repair, and keep in repair, the roadway and the grip at the place where the accident happened. That duty [illegible] with the duty of cutting and trimming the grass at the roadside, and cleaning those grips and keeping them clear from grass; that the grip into which the plaintiff's foot slipped was covered with grass to such an extent that it could not be seen by the plaintiff under the circumstances of the accident in question; that its condition was due to the defendants' breach of their duty and negligence in their capacity as the road authority; that the plaintiff was not guilty of any contributory negligence, but was entitled to assume that she could safely approach [illegible] she in fact did; that the accident to the plaintiff was caused solely by the defendants' breach of duty and negligence above mentioned. He gave judgment [illegible] and costs.

Mr. W. H. Hanscombe, representing the county council, reminded his Honour that at the last hearing he said he would agree to a stay for three weeks, and if notice of appeal was served till the hearing. He presumed that held.

His Honour concurred.

Herts County Road Scheme.—A new scheme of road making and maintenance was decided upon by the Herts County Council at their last meeting. What the council proposes to do is to establish a depot of their own for the supply of materials for the roads, to acquire a fleet of motor lorries for the distribution of material throughout the county, and to do the work by direct labour. The cost of the depot, which is to be situated at Hatfield, is estimated at £7,500, plus the site, £2,400; and there are to be eight rubber-tyred motor lorries (two for the exclusive use of outlying districts), which will cost £6,400. The total capital expenditure is therefore £14,000, which is to be borrowed for a short term of five years. "Shrewd observers," the *Herts Mercury* comments, "will no doubt associate the scheme with the recent changes in the county surveyor's department, and it may perhaps be regarded as the first instalment of a series of departmental developments which the wide experience of Mr. Killick, the new county surveyor, will qualify him to carry into effect."

CLYDEBANK TOWN-PLANNING SCHEME.

LOCAL GOVERNMENT BOARD INQUIRY.

Mr. J. Walker-Smith, M.INST.C.E., on Monday held an inquiry on behalf of the Scottish Local Government Board regarding the proposed town planning scheme of the Clydebank Town Council. Mr. George Ross, the burgh surveyor, stated that the land suitable for town planning totalled 2,680 acres, of which 1,424 were within the burgh and 1,256 within the eastern district of the county; 729 acres of the latter were within the parish of Old Kilpatrick, and 527 acres in the parish of New Kilpatrick. The amount of undeveloped land in the proposed town planning area was 1,660 acres, 478 being in the burgh and 1,182 outwith the burgh. He expressed the opinion that the whole area which it was proposed to town plan could be developed in thirty years. In some parts of the burgh there was an average of 120 houses to the acre. In the Fifth Ward, where the population was most dense, the figure was 615 per acre. In other parts it varied from 77 to 177 houses per acre, and 394 to 599 per acre. Taking the whole area of land already developed within the burgh, including parks and open spaces and the three large public works, there were 422 acres, with 8,730 houses, which gave the average of 20 houses and 102 persons per acre.

Provost Taylor, who also gave evidence, said the corporation's idea of a town plan was that each local authority should have a belt of land round its own area, which it would be allowed to town plan; otherwise the Town Planning Act would not be of much account. He thought they had been extremely reasonable; they had not taken a very large belt of land, and only land that was close to them. They thought they should have the right to say what roads and what type of buildings should be erected there. According to the ratio of the development of Clydebank during the past thirty years, he anticipated that in another thirty years the population—estimated at present to be 44,741—would be 150,000.

The Civic Engineer's Who's Who, compiled by the editor of The Surveyor and Municipal and County Engineer, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

FOR OTHER ADVERTISEMENTS

See End of Paper.

HAVERHILL URBAN DISTRICT COUNCIL.

SUPPLY OF ROAD MATERIAL.

Tenders are invited for the supply of Broken Granite, Slag, and Slag Tar-macadam. Forms of Tender and particulars may be obtained from the undersigned, to whom Tenders, with samples, must be delivered on or before March 15, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

JOHN H. CLARKE,
Surveyor.

Haverhill,
Suffolk.
February 17, 1915. (2,388)

URBAN DISTRICT OF FINCHLEY.

TAR FOR ROAD SURFACE TREATMENT.

The Council of the above-named District invites Tenders for the Supply, in barrels, to the various Depots within its District, of about 55,000 gallons of Tar, in such quantities and at such times as may be ordered by its Engineer, the Council also to have the option of increasing the quantity up to 70,000 gallons, at the price quoted.

The Specification may be obtained on application to the Council's Engineer and Surveyor, Mr. C. J. Jenkin, M.INST.C.E., at the Council Offices, Church End, Finchley.

Sealed Tenders, endorsed "Tar," to be addressed to the undersigned, and delivered not later than 12 (noon) on Wednesday, the 3rd March, 1915.

The Council does not bind itself to accept the lowest or any Tender.

E. H. LISTER,
Clerk of the Council.

Council Offices,
Church End,
Finchley, N.
February 17, 1915. (2,387)

BOROUGH OF NUNEATON.

ANNUAL CONTRACTS.

Tenders are invited for the supply of the undermentioned Materials during the twelve months ending the 31st March, 1916:—

1. Blue Bricks, Kerbs, &c.
3. Disinfectants and Soap.
4. Earthenware Pipes, &c.
5. Granite Kerbs and Setts.
6. Iron Castings.
7. Iron, Hardware, &c.
8. Petroleum.
9. Portland Cement.

Conditions of Contract and Forms of Tender may be obtained on application at my office, and sealed Tenders, endorsed "Tenders for Supplies," must be delivered to me not later than 9 o'clock a.m. on Tuesday, the 2nd prox.

The Corporation do not bind themselves to accept the lowest or any Tender.

F. C. COOK, Assoc.M.Inst.C.E.,
Borough Surveyor.

Municipal Offices,
Nuneaton.
February 17, 1915. (2,389)

COUNTY BOROUGH OF STOKE-ON-TRENT.

SEWAGE DEPARTMENT.

The above Council invite Tenders for the supply of the following Goods to the several Sewage Works in the Borough for the year ending 31st March, 1916:—

1. Press Cloths.
2. Lime.
3. Chemicals.
4. Coal and Slack.
5. Petroleum for Power Purposes.
6. Lubricating Oils.

Full particulars, together with Forms of Tender, may be obtained from the Office of Mr. W. H. Makepeace, Sewage Engineer, Leek-road, Stoke-on-Trent, on or after Monday, 22nd February, 1915.

Contractors will be required to agree to the fair wage clause of the Corporation.

Tenders, endorsed "Tender for ——, Sewage Department," must be sent to me, the undersigned, not later than Monday, 8th March, 1915.

The Council does not bind itself to accept the lowest or any Tender.

E. B. SHARPLEY,
Town Clerk.

Town Hall, Stoke-on-Trent.
February 15, 1915. (2,391)

THE FINSBURY BOROUGH COUNCIL invite Tenders for the undermentioned Supplies, &c., from 31st March next:—

For Three or Six Months—

Fodder,* Peat Moss Litter,* and Timber.

For Six or Twelve Months—

Brooms, Scavenger and Machine.*	Pitch and Creosote Oil.
Castings.	Portland Cement and Lime.
Chandlery.	Sand, Ballast, &c.
Clinker, &c., Disposal of*	Stable Accessories.*
Disinfectants.	Stoneware Goods.
Electric Fittings.*	Tools and General Plant.*
Granite.	Wood Paving Blocks.
Horse and Cart Hire.	York Paving and Patent Stone.
Paints, &c.	

Particulars and Forms of Tender may be had any day save Saturdays, from 10 to 4, and on Saturdays from 10 to 12, on application to the Borough Surveyor at the Town Hall, except that in the case of items marked with an asterisk similar application should instead be made to the Chief Cleansing Inspector, 26 Wharf-road, City-road, N. Postal requests must be accompanied by a stamped and addressed foolscap envelope. Tenders, marked outside "Fodder," or as the case may require, must be delivered to me at this Town Hall not later than Noon on Monday, 1st March prox. Only those made upon the Official Form and properly filled up and signed, and confined to the articles specified therein, will be entertained.

GEORGE WHITEHEAD PRESTON,
Town Clerk.

Finsbury Town Hall,
Rosebery-avenue, E.C.
February 16, 1915. (2,390)

REDUCED PUBLIC LIGHTING.

WHITENING OF EDGES OF STREET KERBS.

During the present [illegible] engineer and surveyor to the Finchley Urban District Council, and Mr. Vincent B. Collins, M.Inst.C.E., the assistant engineer, to consider methods [illegible]

[illegible] the street orderly men, and these men have to lime-wash the [illegible] a steam wagon so as to perform this work in the following manner:—

[illegible] man follows the steam wagon and directs the hose to the [illegible] spread of the spray to the margin requiring whitening. The [illegible] being about 3 miles an hour when in full work; the average speed is reduced to about 2 miles an hour, the loss being due to the time occupied in taking out the empty lime-wash containers and substituting full ones. The whole adaptation has been effected without [illegible] the special requirements.

Public Health Law. This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the general subject only for its purpose in holding [illegible] highways but omitting [illegible] students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.

Council School Spray Baths. In the House of [illegible] it was proposed to instal spray baths in the basement of a projected new council school at Abertillery, and that these were objected to on account of their position [illegible] quite satisfactory; and whether, before finally condemning proposals for spray baths in the basements [illegible] said the Board of Education do not object to the installation of spray baths in the basement of a school building, but it was necessary for them to satisfy themselves that the ventilation and lighting were adequate. This was not the case as regards the baths [illegible] for this reason that the board were unable to approve [illegible]

ROYAL SANITARY INSTITUTE.

MANCHESTER MEETING.

At a meeting of the Royal Sanitary Institute to be held at Manchester to-night (Friday), a discussion on "The Construction of Sewers," which will be illustrated by lantern slides, will be opened by Mr. S. S. Platt, M.Inst.C.E., borough engineer of Rochdale, and on "Housing from the Sanitary Inspector's Standpoint," by Mr. H. Dryland, of the Manchester Sanitary Department.

The chair will be taken at 7 o'clock by Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A.

To-morrow the chairman of the Rivers Committee of the corporation, Alderman Frowde, has kindly consented to arrange for the members to inspect an interesting section of the Manchester main drainage scheme.

* "A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities." By S. G. Turner, of the Middle Temple, Barrister-at-Law. A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

INSTITUTION OF MUNICIPAL ENGINEERS.

[illegible] Mr. W. H. Martin [illegible] Engineer and Surveyor, Chester.

The next meeting of the council will be held in London on Friday, February 26th.

[illegible]

39 Victoria-street, S.W.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

ASSISTANT HIGHWAY SURVEYOR. [illegible] 22nd.—Williton Rural District Council. £90 a year.—Mr. Frank Risdon, clerk, Williton, Taunton.

CHIEF OFFICIAL OF PARKS. [illegible] 22nd. [illegible] J. L. Wheatley, town clerk.

CLERK OF WORKS.—February 23rd.—Rathmines [illegible] Chairman, Town Hall.

CLERK OF WORKS.—February 24th.—Littlehampton Urban District Council. £3 per week.—Mr. A. Shelley, clerk.

CLERK OF WORKS.—February 24th.—Wrexham Rural District Council. £2 10s. per week.—Mr. G. V. Price, interim clerk.

COUNTY SURVEYOR. [illegible] 24th. County Council of Notts. £750 per annum and travelling expenses.—Mr. H. Hampton Copnall, clerk, Shire Hall, Nottingham.

SUPERINTENDENT OF HIGHWAYS.—March 1st.—Corporation of Oxford. £180—£200 a year.—Mr. W. H. White, city engineer, Town Hall, Oxford.

BOROUGH SURVEYOR'S ASSISTANTS.—March 1st.—Corporation of Stockport. £2 5s. per week, [illegible] draught-men.—Mr. John Atkinson, borough surveyor.

ROAD FOREMAN.—March 1st.—Durham County Council. 50s. per week.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

SURVEYOR'S ASSISTANT.—March 1st.—Seisdon Rural District Council. £65 per annum.—Mr. William Cannan, engineer and surveyor, Surveyor's Office, Wombourne, Staffs.

GENERAL FOREMAN.—March 2nd.—Teddington Urban District Council. £104—£120.—Mr. Marshall Hainsworth, surveyor, Elmfield House, Teddington.

SURVEYOR OF HIGHWAYS.—March 25th.—Abingdon Rural District Council. £2 10s., to a maximum of £150.—Messrs. B. & E. M. Challoner, clerk, 67 Stert-street, Abingdon.

ASSISTANT ENGINEERS.—April 1st.—Indian Public Works and State Railways Departments.—Secretary, Public Works Department, India Office, London, S.W.

ASSISTANT.—Romford Rural District Council. £120 per annum.—Mr. W. J. Grant, surveyor, 16A South-street, Romford.

DRAUGHTSMEN.—Sierra Leone Government, Public Works Department. £300—£350.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

SANITARY ENGINEER.—For an English firm in India.—"Sanitary," c/o Deacon's, Leadenhall-street, London, E.C.

DRAUGHTSMAN.—Nigerian Government Railway. £300—£350 per annum.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

BRADFORD.—March 31st.—Designs for the replanning of streets, for the corporation.—The Town Clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

ATHERSTONE.—February 22nd.—For the erection of a public convenience, for the rural district council.—Mr. H. J. Cobley, engineer and surveyor.

BRADFORD.—February 22nd.—For the erection of a destructor, for the corporation.—City Architect.

GLASGOW.—February 22nd.—For the erection of two lavatories, for the corporation.—Mr. J. Lindsay, town clerk.

LEYTON.—February 23rd.—For the construction of underground conveniences, for the urban district council.—Mr. Ernest H. Essex, Town Hall, Leyton.

ST. HELENS.—February 23rd.—For the erection of a refuse destructor, for the corporation.—Mr. A. W. Bradley, borough engineer.

OLDHAM.—February 24th.—For the erection of an accumulator stores, for the Electricity Committee.—Borough Surveyor.

LUTTERWORTH.—February 24th.—For the erection of seven houses, for the rural district council.—Mr. A. J. Ross, surveyor.

HULL.—February 24th.—For the construction of a urinal, for the corporation.—Mr. F. W. Bricknell, acting city engineer.

HUDDERSFIELD.—February 25th.—For the erection of a pavilion, for the corporation.—Mr. W. Cooper, architect, 1 Kirkgate Buildings, Huddersfield.

SHEFFIELD.—February 25th.—For the extension of engine-room and boiler-house and the erection of switch-rooms and stores, for the Electric Supply Committee.—Mr. S. E. Fedden, general manager, Commercial-street, Sheffield.

GLASGOW.—February 27th.—For the erection of public halls, for the corporation.—Office of Public Works, 64 Cochrane-street.

CASTLEREA.—February 27th.—For the extension of the waterworks, for the rural district council.—The Clerk.

MENAI.—March 1st.—For the construction of a reservoir and laying mains, for the urban district council.—Mr. W. Owen, waterworks engineer, Dale-street, Menai Bridge.

DUNDEE.—March 1st.—For the construction of the foundations of the new city hall, for the corporation.—City Architect.

SOMERSET.—March 1st.—For the erection of a school, for the county council.—Messrs. Jane & Fry, architects, Waterloo-street, Weston-super-Mare.

HERTS.—March 1st.—For additions to a school, for the county council.—County Surveyor, Hatfield.

ESSEX.—March 1st.—For the reconstruction of Wickford Bridge, widening of roadway, pointing of ironwork, and removing existing bridge, for the county council.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

STOCKPORT.—March 1st.—For the erection of a refuse destructor, for the corporation.—Mr. J. Atkinson, borough surveyor.

HUDDERSFIELD.—March 2nd.—For the erection of a tuberculosis hospital at Bradley Gate, for the corporation.—Mr. K. F. Campbell, borough engineer.

BARNSLEY.—March 4th.—For the erection of a new town hall, for the corporation.—Town Clerk.

HUDDERSFIELD.—March 4th.—For the construction of a filter-house, for the corporation.—Waterworks Engineer, Town Hall.

KENT.—March 4th.—For the erection of a medical officer's house at the county asylum, for the Asylums Committee.—Engineer, County Asylum, Barming Heath, near Maidstone.

WORSLEY.—March 5th.—For the erection of a pump-house, for the urban district council.—Mr. J. Howard, surveyor.

TREDEGAR.—March 15th.—For the erection of a caretaker's lodge at the cemetery, for the urban district council.—Mr. W. Lloyd Roach, surveyor.

NORTHAMPTON.—March 25th.—For the erection of twenty cottages, for the corporation.—Waterworks Office, Fish-street, Northampton.

Iron and Steel.

EVESHAM.—February 22nd.—For the construction of about 3 miles of water mains, valves, hydrants, air valves, meter, and necessary chambers in connection therewith, for the rural district council.—Messrs. Wilkes & Rankes, Union Chambers, 63 Temple-row, Birmingham.

MANCHESTER.—February 23rd.—For the supply of galvanised steam pipes, for the corporation.—Superintendent, Markets Department.

CHEPPING WYCOMBE.—March 6th.—For the supply of galvanised tubes, lab and stop cocks, and valve and stopcock boxes, for the corporation.—Mr. T. J. Rushbrooke, waterworks engineer, Easton-street, High Wycombe.

PLYMOUTH.—March 9th.—For the supply of cast-iron pipes, for the corporation.—Mr. F. Howarth, city engineer.

Roads.

MARPLE.—February 22nd.—For the supply of granite macadam and chippings, Macclesfield macadam and chippings, limestone macadam and chippings, 6-in. setts, and sanitary pipes, for the urban district council.—Mr. D. J. Diver, surveyor, Council Offices, Marple.

HIGHWORTH.—February 22nd.—For the repair of roads and hauling materials, for the rural district council.—Mr. O. Kimber, surveyor, Kite Hill, Wanborough, Wilts.

DONCASTER.—February 22nd.—For road improvement works, for the rural district council.—Mr. W. R. Crabtree, surveyor, Union Offices, High-street, Doncaster.

HARROGATE.—February 22nd.—For the supply of road materials, for the corporation.—Mr. C. E. Rivers, borough engineer and surveyor.

PENARTH.—February 22nd.—For the supply of mountain limestone, road metalling and gravel, basalt or granite gravel, for the urban district council.—Mr. E. I. Evans, surveyor.

MANSFIELD - WOODHOUSE.—February 22nd.—For the reconstruction of upwards of 2 miles of road, for the urban district council.—Mr. F. P. Cook, surveyor.

PENYBONT.—February 22nd—26th.—For the construction of new roads, for the rural district council.—Mr. E. Jenkins, surveyor, Nolton-street, Bridgend.

HENDON.—February 22nd.—For making up certain roads, for the urban district council.—Mr. S. S. Grimley, engineer and surveyor.

COUNTY OF DURHAM.

APPOINTMENT OF ROAD FOREMAN

The County Council of Durham invite applications for the position of Road Foreman in the Auckland and Chester Main Road District.

Applicants must have had practical experience in the construction and repair of paved and macadamised roads, in the supervision of manual and team labour, and in keeping time and materials accounts.

He will be required to work the same hours as the workmen, and to reside at an approved centre within the district.

The commencing wages will be 50s. per week, with an allowance of 3s. per week for use of a bicycle.

Applications, in candidate's own handwriting, giving full particulars of previous experience, stating age, and accompanied by not more than three recent testimonials, to be sent to the undersigned not later than 1st March, 1915.

ALBERT E. BROOKES,
County Surveyor.

Shire Hall,
Durham.
February 10, 1915. (2,383)

SEISDON RURAL DISTRICT COUNCIL.

SURVEYOR'S ASSISTANT.

Applications are invited for the appointment of Temporary Assistant in the Engineer and Surveyor's Department.

Applicants must be good Draughtsmen, with a good knowledge of Surveying, Levelling, Building and Drainage Inspection, and the general work of a Surveyor's Office. Salary at the rate of £65 per annum, with bicycle.

Applications, in candidate's own handwriting, endorsed "Surveyor's Assistant," stating age and experience, accompanied by copies of not more than three recent testimonials, and giving the date on which the applicant can take up his duties, must be received by me not later than Monday, the 1st March, 1915.

WILLIAM CANNAN,
Engineer and Surveyor.

Surveyor's Office,
Wombourne.
February 12, 1915. (2,369)

TWO DRAUGHTSMEN required for the Sierra Leone Government, Public Works Department. Salary £300—£10—£350. Free first-class passages and quarters. Liberal leave in England on full salary. Age 25—35. Candidates should have had considerable experience in architectural and engineering draughting, and should have held a responsible position in the drawing office of an Architect and Surveyor, or Civil Engineer in good general practice. Neat and expeditious draughtsmen. They should also have had experience in control of a drawing office staff, and be capable of getting out designs and details of buildings, including steel frame work, bridges and other works, with some experience in architectural design. Should be well up in building construction and in the preparation of specifications, bills of quantities, and estimates.

Candidates should apply at once, by letter, giving full particulars of experience, &c., to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W. (2,364)

SANITARY ENGINEER (fully qualified) required for India by an English firm of General Engineers with large Works having several departments, to take charge of their Sanitary Department. Must have had a sound practical and business training, and be able to conduct correspondence, make up plans and estimates, and secure orders, and carry out to completion Sanitary Contracts, taking charge of foremen, plumbers, &c.

A knowledge of Septic Tank Installations and Minor Sewage Disposal Work generally is essential.

Contracts for the Sanitary work of Hospitals, Native Palaces, and other buildings are carried out in different parts of India, which will necessitate some travelling.

A good salary, with five years' agreement, passage both ways, will be given to a well-educated, experienced Engineer with good address.

Age from 30 to 35 years; bachelor preferred.

Application to be made in own handwriting, stating experience, age, if married or single, with copies of any testimonials, to "Sanitary," c/o Deacon's, Leadenhall-street, London, E.C. (2,372)

RURAL DISTRICT OF ABINGDON.

APPOINTMENT OF SURVEYOR OF HIGHWAYS, &c.

The Council of the above district is prepared to receive applications for the appointment of Surveyor of Highways. The District comprises 24 parishes with about 90 miles of district roads.

The salary will be £130 per annum, rising by annual increments of £2 10s. to a maximum of £150.

Forms of application will be forwarded by the undersigned on receipt of a stamped addressed foolscap envelope, and must be returned to us on or before the 25th prox.

Canvassing of the Councillors is strictly prohibited, and will be deemed a disqualification.

(By order)

Telegraphic Address—"HEAT, STOURBRIDGE." Telephone No. 10.

URBAN DISTRICT COUNCIL OF TEDDINGTON.

APPOINTMENT OF GENERAL FOREMAN.

The Council invite applications for the appointment of General Foreman.

Applicants must be between 30 and 45 years of age. Practical experience essential in the construction and maintenance of roads, sewers, paving, and other Municipal works, the keeping of the necessary wages and stores books. The duties will also include the supervision of the Council's horses.

Salary £104 per annum, rising by annual increments of £4 to a maximum of £120, the appointment to be subject to one month's notice on either side.

The person appointed will be required to reside at the Council Offices and act as Caretaker; an extra allowance of 5s. per week will be paid for cleaning offices, with free quarters, fire and gas.

No application will be considered unless made upon a Form to be obtained from Mr. Marshall Hainsworth, Surveyor, Elmfield House, Teddington, to be accompanied by not more than three copies of recent testimonials, which will not be returned, and must be received by the undersigned not later than noon on Tuesday, the 2nd March, 1915.

Canvassing, directly or indirectly, any Councillor or Officer of the Council will be a disqualification.

(By order)

G. H. SALMONS,
Clerk.

Elmfield House,
Teddington.
February 15, 1915. (2,380)

COUNTY BOROUGH OF STOCKPORT

BOROUGH SURVEYOR'S ASSISTANTS

The Highways and Sewers Committee is prepared to receive applications for the appointment of a Junior Draughtsman, salary £2 5s. per week, and two Temporary Draughtsmen at £2 2s. per week

Applicants for the position of "Junior Draughtsman" must state whether they are willing to accept the temporary positions.

Applications, in candidate's own handwriting, stating age, qualifications and experience in the routine of a Borough Surveyor's Office, accompanied by copies of two recent testimonials, to be delivered to the undersigned before Monday, the 1st March, 1915, endorsed "Junior Draughtsman," and "Temporary Draughtsman."

JOHN ATKINSON, A.M.Inst.C.E.,
Borough Surveyor.

Town Hall, Stockport.
February 15, 1915. (2,377)

COUNTY COUNCIL OF NOTTS.

APPOINTMENT OF COUNTY SURVEYOR.

The County Council of Notts are desirous of receiving applications for the office of County Surveyor. The person appointed will be required to reside in or near to the Town of Nottingham, and to devote the whole of his time to the discharge of the duties of the office. He will not be allowed to engage in any private practice.

The salary will be £750 per annum, and, in addition, travelling expenses will be paid.

Applications, marked "County Surveyor," with copies of not more than three recent testimonials, must be made upon Forms which will be forwarded by me upon receipt of an addressed foolscap envelope.

The applications must reach me not later than midday on Saturday, the 27th day of February, 1915.

Canvassing is strictly prohibited, and will be deemed a disqualification.

(By order)

H. HAMPTON COPNALL,
Clerk of the County Council.

Shire Hall,
Nottingham.
February, 1915. (2,304)

WANTED, Surveyor, with road-making experience. Preference given to one who has passed Civil Engineer or Inst. Mun. Engineers. State age, salary and experience.—Address Highways Construction, Limited, Finsbury-court, London, E.C. (2,322)

And Municipal and County Engineer.

Vol. XLVII. FEBRUARY 26, 1915. No. 1,206.

Minutes of Proceedings.

Construction of Sewers.

At the meeting of the local Sanitary Institute held at Manchester on April last Saturday last. The discussion was opened by a lecture by Mr. S. S. Platt, engineer to the Sewerage Committee of Rochdale. A great portion of the ground covered by the lecturer was necessarily familiar to many of the municipal engineers attending the meeting, but as there were a large number of young engineers and students present this was not a disadvantage from the educational point of view. The numerous slides shown, especially those lent by Mr. de Courcy Meade, M.INST.C.E., giving the details and [illegible] construction of the Manchester main sewers, were particularly interesting and instructive. In the discussion which followed the lecture several speakers dealt with the question of the relative merits of concrete and brick sewers. The leading of the sewers appeared to favour the use of concrete for pipes of 12 in. or a larger diameter, though a few speakers [illegible] for large sewers. Portland cement was preferred. Except on the ground of economy, the [illegible] of vitrified pipes was not favoured. Such pipes were liable to [illegible] and [illegible] as the joints were not reliable and can be thoroughly tested before use. It is not usual to test the quality of concrete in *situ* other than by testing the quality of the cement and the careful inspection of the proportions and nature of the materials used and the mixed. A close examination of the surface of the sewers [illegible] was necessary, but it is obvious [illegible] practical acquaintance with concrete sewers on a large scale that the concrete [illegible] allow of a much more satisfactory test, and will therefore inspire more confidence in their use.

Another point discussed was the method to be adopted in hilly districts, so as to avoid too steep gradients in the sewers and to prevent the accumulation of sewer gas from the lower to the higher levels. While all the speakers were agreed as to the necessity for avoiding as far as possible steep gradients, so as to prevent too great velocities and the consequent erosion in the sewers, they were by no means agreed upon the form of ramp to be adopted or the necessity for traps and valves on the sewers. Many local authorities do not now insist on traps on house drains, and at their best they can only be looked upon as necessary evils. In sewers their use is certainly undesirable, and vent shafts carried to a sufficient height to discharge any sewer gases safely appear to meet all the requirements of the case, while they are [illegible] urged against the use of flap valves and traps.

The amount of storm water to be provided for [illegible] perhaps the most difficult of all the problems with which the sewerage engineer has to deal, and it is [illegible] than in almost any other branch of municipal engineering. When we find two cities so very similarly situated in many respects as London and Liverpool, in which the variation in the amount of storm water to be carried by the main sewers is equal to ¼ in. per twenty-four hours in the one case and 6 in. in the other, it is evident that there is something besides local conditions to account for this great difference. There are [illegible] rainfall which will reach the sewers, but there [illegible] tion, and local conditions are so variable, that the best of them is only approximate, and requires to be used with great care and judgment. The need for using the heavy Accrington engineering or Staffordshire blue brick was questioned by Mr. Cooper. He appeared to consider them unnecessary in the London district, but for durable and sound work a harder brick than the London stock brick or the gault brick is certainly desirable, and would in the long run prove the most

Aberdeen Water Sterilisation.

Whether it would be to the [illegible] general that our leading scientific workers should have the courage of their convictions and demand universal sterilisation of water supplies, or whether a slower and more cautious policy is desirable, the fact is clear that they do look with growing misgiving at untreated waters, and the time may not be far distant when the presence of coli in any drinking water will be considered inadmissible. Dr. Houston tells us [illegible] as to require no purification "there is always the danger to be considered of possible accidental pollution, with no purification process, or an inadequate one, to safeguard the consumer," while in the case of a water the initial purity of which is so doubtful as to call for treatment, "the water being always regarded as potentially dangerous, is always treated as if it were actually dangerous, and therefore delivered to the consumer habitually in a safe condition." It is clear, therefore, that his opinion—which is also that of every other leading authority—is that no water, however pure in its initial state, is absolutely above suspicion

by the time it reaches the service mains, and that it may be made perfectly safe by ordinary simple treatment. The danger of accidental or unexpected pollution is acute at the present time owing to war conditions. One has not far to look for actual examples of polluted supplies, and in the coming year we must expect to find many of our supplies, not excepting London, affected. The value of the new methods of sterilisation is therefore very great, and all advances and new applications of the various methods already in use should be studied.

The case of Aberdeen, dealt with in our last issue, is therefore of great interest and importance. The report, prepared by Dr Matthew Hay, the medical officer of health, and Mr. Cecil H. Roberts, the city water engineer—extracts from which were quoted—was accompanied by a separate report made by Dr. Houston. It describes the successful application of a threefold process—viz., treatment of the water with an excess of lime, storage, and filtration. It is interesting to note the successful result of such collaboration. The cost of a large reservoir sufficient to purify the water by storage was avoided by the use of the lime and by the after-treatment on filters. The use of lime renders both prolonged storage and slow filtration unnecessary, while it sterilises the water. The storage provides a period of contact during which the sterilisation is effected, and also effects the removal by conversion into carbonate or bicarbonate of lime of the excess of lime beyond what is required for the neutralisation of the water. This results from the contact of the water with the carbonic acid in the air. If necessary, further aëration can be given, or the water can be treated with carbonic acid gas, which can be produced artificially and cheaply. It is interesting to note that, if as a result of such treatment the water should contain an excess of carbonic acid, this must of necessity be neutralised when the water passes through the filters, because they will naturally contain a reserve of carbonate of lime. The chief use of the filters is the clarifying of the water by removing all suspended matters. It is also of interest that this water, treated with two parts of lime per 100,000, stored for seven days and filtered, is absolutely free from .coli, and is given a slight degree of hardness which will prevent the corrosion that has hitherto taken place in the iron water pipes. The example of Aberdeen shows very clearly how thoroughly profitable is the [illegible] water supplies.

* * *

Street Accidents and Local Authorities.

In discussing [illegible] issue the extent of the liability of a highway authority, also acting in some other capacity such as sewer authority—for some negligent omission causing injury to some person using the highway, we referred at some length to the case of *Partridge v. Battersea Borough Council*. It may be within the recollection of our readers that in that case the plaintiff was seriously injured owing to a fall from her bicycle caused by its [illegible] with a defective grill. The defendant council were both highway authority and sewer authority, and in the Court of first instance Mr. Justice Horridge held that, although in the former capacity they were not liable for mere nonfeasance, they were so liable in the latter capacity, and substantial damages were awarded. The council appealed, and the Court of Appeal, without expressing any opinion on the legal questions involved, ordered a new trial on the ground that the former trial had been unsatisfactory as regards certain questions of fact. The conclusion of this new trial, the result of which has been awaited with great interest, was reached on Saturday last, when judgment was delivered by Mr. Justice Scrutton.

It is interesting in the first place to observe that the second jury reduced the damages as originally assessed from £1,900 to £755. The question of liability was then argued, and upon that the learned judge held that the defendant council were not liable. In giving judgment, he pointed out that at the second trial, although the jury had found that the grid was in fact broken they had also found that the non-discovery of this by the defendant council did not amount to negligence on their part. They were further of opinion that the primary cause of the accident was that, as originally constructed, the level of the grid was so much below the level of the road as to be dangerous, but that again the council were not negligent in not having discovered the danger. On these findings, the first question that arose for consideration was whether the grid was part of the road or part of the sewer, and this was left to the jury as a question of fact. The jury found that the grid was part of the road, and with this finding Mr. Justice Scrutton expressed his agreement. The next point was that, although the grid had been dangerously constructed when first put down, that had been done by the predecessors of the defendant council, and in the Act by virtue of which the Wandsworth District Board of Works were succeeded by the Battersea Vestry, there were no express words transferring liabilities. The result was that the defendant council had merely done nothing to alter a dangerous grid put down by their predecessors—that is to say that, as highway authority, they were guilty of mere non-feasance, and therefore not liable. Mr. Justice Scrutton commented on the unsatisfactory state of the law by which there is such a fundamental difference between the respective liabilities of highway and sewer authorities, and said that the remedy was fresh legislation, by which the two authorities might be put upon the same footing. The result of the new trial was eminently satisfactory to the council, for whom judgment was entered with the costs of both trials and the appeal.

* * *

Town Planning and the Landowner.

By far the greater part of the literature of town planning is concerned with what may be called, for want of a better expression, the public aspect of the question, and although the interests of the landowner are recognised in a general way as being worthy of great consideration, his particular point of view has not perhaps hitherto received the special attention which it undoubtedly deserves. This is all the more strange, inasmuch as evidence is accumulating to show that there is in reality very little conflict of interest between the owner who wishes to develop his estate with the greatest possible profit to himself and the town planning authority whose first business is to secure development on lines consistent with public interest and amenity. Mr. G. L. Pepler, A.R.I.B.A., whose paper on the "Economics of Town Planning in Relation to Land Development" will be found in another column, being convinced that, unless town planning is economically sound, all its other virtues are of little practical use, asks the question whether it is financially sound as regards land development, his answer being a reasoned affirmative. The mistakes of the past were in great measure due to a too hasty development of estates, following upon the rush to the towns caused by the great industrial revival of the middle of the nineteenth century. Surveyors to-day, however, are able to profit by these mistakes, and fully recognise the necessity for [illegible] scheme in estate development

that further roads, that such a general scheme should include the determination of the routes to be followed by the principal roads, the class of property to be served, and the order in which the several parts of the estate are to be developed. These things in themselves go some way towards a real solution of the town planning problem, and have a recognition by the local owner that the demand for more space and better conditions of living is one that must be met if houses are to be made marketable.

The general principle was well stated by Mr. Pepler when he said that the greater the foresight with which an estate is developed from the commencement, the greater will be the ultimate value. In many cases, however, the well-intentioned owner cannot afford to wait, and is hampered by questions of immediate finance. To meet this difficulty, Mr. Pepler takes advantage of the growing tendency for people to own the houses in which they live, and puts in a plea for co-partnership housing or for the building of houses for sale by estate development companies. Finally, he considered the effect of the Town Planning Act, and concluded that on the whole its effect upon the economics of estate development had been a beneficial one.

The London County Council's Drainage Proposals.

The truce in matters contentious while the war lasts is responsible this week for the withdrawal by the Parliamentary Committee of the London County Council of certain clauses relating to the sanitary equipment of new buildings contained in the Council's General Powers Bill, 1915. The proposals are far-reaching, and it is indisputable that they would have met with strong opposition from the borough councils. They provide (Part III.) that all houses and buildings erected or rebuilt after the passing of the Act shall be provided with drains so constructed as to prevent at all times and under all conditions the flooding of any part of the building from the flowing back of sewage from the drains. Where it was impracticable to construct the necessary drains so as to act by gravitation, pumping or some other means of conveying the sewage from the house might be adopted. It was also provided that if a building was liable to flooding by reason of inefficient drainage, the council might require the owner within a period of not less than twenty-eight days to make alterations of, or additions to, the drainage system, or provide a new system, while he could be called upon to fill in or otherwise discontinue the use of any basement, floor, cellar, or area belonging to the building.

Provision was also made that the council should repay to the owner the expenses of carrying out any of these orders, and that in respect of the basement requirements the council should pay to the owner or occupier reasonable compensation for any injury suffered by reason of the order made upon him. Part IV made it unlawful for any person upon land of which the surface is below the level of 5 ft. 6 in. above Trinity high-water mark, and which is so situated as not to admit of being efficiently drained at all times and under all conditions by gravitation into an existing sewer of the council (whether a building had been previously erected on the land or not) to erect any building or to adapt or use a building for any purpose for which it was not used at the date of the passing of the Act, except with the permission of the council, and subject to such regulations as the council might prescribe. The borough councils are naturally jealous of any threatened interference with their prerogatives, and their practically united contention was that if new powers with respect to drainage could be proved to be necessary they should be in their hands. A conference [illegible] is, but it would be regrettable if, as in this instance, differences arose over the details of a sanitary problem as to the aim and utility of which all the local authorities are probably in agreement.

Reinforced Concrete and Economy.

At the last meeting of the Concrete Institute, Mr. T. A. Watson, ASSOC.M.INST.C.E., read an interesting paper entitled Economy in Reinforced Concrete Construction," in which he made some telling comparisons between the respective costs of brickwork and reinforced concrete for various purposes. The result of the detailed estimates which he submitted was to show that, while great savings can be made on retaining walls, it is generally not economical to employ reinforced concrete for the external walls of buildings, as such walls up to a thickness of 14 in. are cheaper, but that when walls have to be thicker than this reinforced concrete comes in. As under the proposed London County Council regulations nearly all external walls need not exceed 14 in. in a framed building, it is probable that reinforced concrete walls for this purpose will soon cease to be used from the point of view of economy. With regard to the economy of reinforced concrete-framed buildings outside the London area, this is very considerable; inside the London area the London County Council, by their regulations, propose to reduce it as much as possible. There are, however, opportunities to effect savings over a steel-framed building even in London. The latter part of the paper dealt with possible further economies in the cost of reinforced concrete work, and in this connection reference was made to the enormous amount of waste which occurs from the practice of obtaining several designs with prices from specialists. This is a matter upon which we have frequently commented, and we need say no more on the present occasion than that we entirely agree with Mr. Watson that the custom referred to puts an initial charge on reinforced concrete which might be avoided if the architect or engineer would only choose his system, or employ a consulting engineer accustomed to the work to design the reinforced concrete work, and then send out for prices in the usual way.

Fighting Disease.

In times like the present it is obviously imperative that every precaution should be taken to guard against the spread of infectious disease, and it is satisfactory to know that the Local Government Board have lost no time in taking steps to combat the recent outbreak of cerebro-spinal—or spotted—fever, cases of which have been reported from various parts of the country. The board draw attention to the matter in a circular which they have issued this week to the clerks of sanitary authorities and to medical officers of health, the document being accompanied by a revised Memorandum on the disease and the administrative and other measures that should be taken to prevent further outbreaks. The board trust that councils and the medical officers of health will adopt such measures as may be necessary, on the lines indicated in the Memorandum, should any cases of the disease occur in their district. The board particularly draw attention to the importance of the sanitary authority making arrangements for assisting medical practitioners to obtain an immediate diagnosis in suspected cases of the disease, for isolating patients suffering from it, for disinfection, and for the supervision of contacts.

Electrolytic Action on Gas and Water Mains.

By HARRY E. YERBURY, M.INST.C.E.

At a meeting of the Institution of Civil Engineers on Tuesday evening, Mr. Harry E. Yerbury, M.INST.C.E., dealt in a paper with the electrolytic action of return currents in electric tramways on gas and water mains, and discussed means of providing against electrical disturbances.

The paper opens with reference to the systematic study which has been given to the causes of corrosion, and epitomises the theories which have been evolved as a result of this study. The author favours the electrolytic theory, as its effect can be demonstrated. The process is, moreover, in full accord with modern thought, based on the fact that metals have a definite solution pressure, and by the Nernst formula this and an osmotic pressure are all that is required for electromotive force, and hence for corrosion.

Electrolysis may be intensified by an extraneous or leakage current from, say, electric tramways worked, as they invariably are, by an uninsulated track. A case is cited where a protective clause was inserted by a gas company against possible injurious action by such leakage currents. Board of Trade Rules and Regulations, and their revisions, from 1894 to the present date, are criticised. The influence of a leakage current on reinforced concrete is dealt with.

It is assumed that concrete conducts electrolytically, and not like a metal, and cases are recorded where electrolysis has been attributed to an impurity—such as calcium sulphate—which was added to cements of American make to retard quick setting. The seriousness of the mechanical effects due to the products of corrosion is pointed out in connection with reinforced-concrete structures.

The constitution or structure of metals has undoubtedly an influence on the effects of electrolytic action, and white cast-iron has been proved to be less susceptible to corrosion and pitting than grey iron, as it contains less graphitic carbon and silicon. The influence of high percentages of silicon in cast and wrought iron is cited. In the subject-matter of the paper the causes and results of pitting have not been specifically dealt with, apart from general corrosion, and the expression "damage to pipes" is to be understood to mean both local pitting and general corrosion.

The preventive measures proposed by British and Continental authorities in order to reduce the potential differences between tramway tracks and pipes are classified, and a description of the function of a negative booster is given in detail.

Two theoretical diagrams are given to show the working and effect of a booster system as compared with unboosted negative return conductors. Where the rails and the mass of earth are positive to pipes in the vicinity of the track, there can be no danger to pipes in that area, as they are cathodic. On the other hand, danger exists to all pipes and metallic structures—where embedded in soil—which are positive to the rails, as it is the flow of current out of the pipes that has a tendency to cause corrosion and pitting. The danger, however, is nothing like as great as would appear from the theoretical standpoint. Obviously, if the boosted and unboosted return conductors bonded to the rails are kept at or about the same potential, the ideal system as affecting leakage currents is brought about. Assuming that the potential of the rails, at some point where a negative boosted conductor is bonded, is lowered to an abnormal degree, it follows that pipes carrying a leakage current are invited to give up their charge, as the difference of potential is thereby increased.

This fact is appreciated by the Board of Trade, as one regulation stipulates that the direction of the current should be reversed by interposing one Leclanché cell (1·48 volt) if the current is from the pipe to the return, whereas up to 4·4 volts are allowed where the direction of the current is from the uninsulated return to any pipe in the vicinity. Results of actual potential difference and current tests on Sheffield pipes in various parts of the city are shown.

As current density and duration of current are the most important factors in connection with injurious electrolytic action of or on gas or water pipes, potential readings are somewhat misleading, as it is now well known that where a comparatively high difference of potential exists there is as a rule less injurious current passing. This is largely attributable to the counter electromotive force of polarisation. In Sheffield, when the tramway system and generating station have been shut down, differences of potential up to 0·66 volt have been observed on pipes.

Board of Trade regulations in respect to leakage currents can easily be complied with on all tramway undertakings, and are absolutely effective in safeguarding the property of other authorities. As 650 volts are allowed as a generating or transforming pressure, in the author's opinion up to 600 volts could be allowed between overhead conductors and earth, as 10 per cent is often the maximum drop on a tramway system. This increase of voltage would reduce the cost of feeders, and also the heavy currents now dealt with.

Electrical disturbances, apart from return currents, are mentioned, such as electromagnetic and electrostatic induction. Single-phase alternating-current railways are especially troublesome. Telephone-circuit interference is chiefly due to harmonics of such a frequency as to come within the range to which the ear is sensitive. Voltage waves from generators and transformers are usually distorted, and do not vary uniformly according to the sine law. Star-connected alternators with earthed neutral point frequently cause disturbances in neighbouring telegraph and telephone systems, due to the presence of triple-frequency harmonics in the pressure wave.

The interference with telegraphs and telephones is not entirely confined to alternating-current systems, and trouble has been experienced by pulsating direct current set up by the generators or rotary converters. Special study of each individual case is required before a remedy can be applied. It is desirable, however, that in continuous-current generation and distribution the generators should produce a current without appreciable pulsation, and for alternating work generators having a pure sine wave should be used.

The influence of magnetic fields near tramway tracks has not been considered in the paper, as such disturbances only appreciably affect magnetic observatories.

The paper concludes with a summary, and a theory is put forward that incrustation in the bore of pipes is often caused by local electrolytic action. This growth might be started as a speck of rust, thus forming with the iron a galvanic couple, the oxide being electronegative to iron. The electrolyte might be created by the secretions of animalculæ or other acids. This nucleus would then establish a closed circuit, and the growth would continue by the increased bulk of oxide acting as a shell to retain the electrolyte. Iron pipes should be subjected at a proper temperature to a dipping in some bituminastic solution so as to form a tough adherent covering. This appears to be the best preventive against internal and external corrosion or pitting.

The author suggests that a field of research is open to metallurgists to determine whether corrosion of wrought iron and steel is due to local electrolytic couples set up by some internal crystalline arrangement or to thermal or mechanical stresses in manufacture. It appears that cold worked metal is generally anodic, and can be changed to a cathodic condition by annealing. When cold worked and unworked metal are in contact the possibility of an electrolytic couple exists. Alternating stress steel is also a potential cause of corrosion. Metallic connections to the rails, such as bonds from tramway poles and feeder pillars, should be as few as possible, and all pipes should be kept at least 2 ft. from the track. All rail joints should be tested periodically. Where joints are welded, a copper bond is recommended as a precautionary measure in case of a high resistance being set up by a badly welded joint, which resistance in course of time would be intensified by additional oxidation.

Concrete Institute.—At a meeting of this body to be held on Thursday, March 4th, at Denison House, 296 Vauxhall Bridge-road, Westminster, Mr. R. Graham Keevill, A.M.I.MECH.E., will read a paper entitled "Some Notes on Wind Pressure."

The Construction of Sewers.

ROYAL SANITARY INSTITUTE DISCUSSION AT MANCHESTER.

At a meeting of the Royal Sanitary Institute held in the Municipal School of Technology, Manchester, Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A., in the chair, a discussion on the "Construction of Sewers" was opened by Mr. S. S. Platt, M.Inst.C.E., F.G.S., borough surveyor of Rochdale. The audience, which numbered over 150, included Prof. Boulnois (Municipal School of Technology), Messrs. S. S. Platt (Rochdale), F. J. Dixon (Ashton-under-Lyne), J. A. Settle (Bury), J. H. Walters (Congleton), J. B. Nuttall (Heywood), A. J. Price (Lytham), J. B. Cook (Denton), C. H. Cooper (Wigan), T. de Courcy Meade (Manchester), C. E. Wood (Salford), S. E. Bagnall

MR. S. S. PLATT.
Borough Engineer and Surveyor.

(Macclesfield), H. Ellis-de (Swinton), Peel (Bury), H. Dearden (Dewsbury), T. S. Parker (Eccles), W. H. Roby (Abram), and R. H. Worthington (Irlam).

In the course of his introductory remarks Mr. Platt alluded to some special points of practice arising out of his experience of over forty years, and illustrated his remarks with the aid of over fifty lantern slides.

Dealing with circular brick sewers, from 3 ft. diameter to 15 ft., he referred to the necessity of departing from that form in sewers on the combined system, *i.e.*, taking both sewage and rainfall when the minimum flow might not ensure self-cleansing velocities with slack gradients, and thereby necessitate the adoption of the egg-shape form. He pointed out the limitations of circular pipes under such conditions. Illustrations were shown of various forms of egg-shaped sewers of brickwork and concrete tubes. The quality of materials for brick sewers was referred to, including invert blocks of blue Staffordshire metal and granite concrete.

Waterlogged foundations were spoken of, as well as the modes of dealing with these, and the necessity for boarding the bottom of the trench in some circumstances, to support the concrete foundation of the sewer.

Reference was made to where the solid foundation under the sewers was at a considerable depth below the invert—namely, over a recently filled-up valley, or where the excavation was through a bed of peat. In these cases the sewer was carried on a planked or reinforced-concrete foundation supported on piles driven into the solid ground, and in shallow filling supported on concrete reinforced with expanded metal or other similar reinforcement. In shallow beds of peat the peat was removed and replaced with rough concrete or flat bedded rubble surmounted by concrete for the reception of the sewer. Mr. Platt then dealt with sewers in very hilly districts where ramps or syphon drops were introduced to break up the ventilation and prevent sewer gases rising to the upper [illegible] to counterbalance the excess [illegible] a steep gradient.

The details of manholes were referred to, and slides shown of the standardised type in the Manchester main drainage, and especially for the junction of sewers at an ordinary depth with the main at a greater depth. Ventilation shafts at the summit of sewers were next mentioned, and the necessity for the provision of rust pockets at the foot of these shafts to prevent their blockage by rust and so being rendered inefficient was touched upon. The speaker then dealt with tunnelling with and without compressed air, and with and without cast-iron linings in segments as carried out on the main drainage at Glasgow, Manchester and Rochdale.

In all cases, whether cast-iron segments were used or not, it was necessary that any small space intervening between the back of the work and the strata passed through should be completely filled up with liquid lias lime grout injected under compressed air up to 50 lb. or 60 lb. pressure. Where iron segments were used the flanges were made on the inside, and it was necessary, after several lengths of cast-iron lining had been placed in position, to line it up with a concrete and brick lining to form the inside of the [illegible]

[illegible] Manchester main drainage had been excavated with timber supports by the aid of compressed air without iron linings, these latter only being used where the strata [illegible] specially treacherous nature. Slides were shown of the work at different stages of the Manchester main [illegible]

In Glasgow there were instances of where iron segments were used in tunnel without the use of compressed air through strata consisting of muddy clay [illegible] ring of the segments at a time (18 in. wide), and the precaution taken of keeping the face constantly on the move, excavating and building one ring at a time, and the men standing on the last ring built and never on the ground itself.

SEWERS UNDER RIVERS AND CANALS.

Reference was made to the necessity at times of carrying sewers under rivers and canals, and the special requirements in such cases. The sewer was generally executed in cast-iron pipes surrounded with [illegible] and in the case of canal crossing further enveloped near the bottom of the waterway and its sides by puddled clay.

Mr. Platt spoke of a specially interesting piece of work carried out at Rochdale to enable a sewer to be carried under a canal embankment which rested on running sand for a considerable depth. After considering several proposals, it was eventually decided to carry the sewer under the invert of an adjacent culvert which carried a brook through the canal embankment. The culvert was 8 ft. 9 in. high by 7 ft. 6 in. wide, of elliptical section, and formed of four half-brick rings. The sewer was formed of a hollow cast-iron invert block, which was substituted for the brick invert of the culvert. The preliminary stages of the work consisted of drilling holes through the invert of the culvert and injecting into the substrata very finely ground liquid lias lime grout through each of the holes by means of a grouting apparatus worked with compressed air at varying pressures up to 60 lb. per square inch, with the object of displacing the water present under the culvert and grouting the interstices of the sand, and so forming an artificial foundation which could afterwards be excavated to with safety. After the foundation had been allowed to set sufficiently long, the brick invert was cut out in short lengths and substituted by a cast-iron hollow invert block to form the sewage conduit made of a special section equal in area to a 24-in. circular pipe. The sections were 2 ft. in length, having a minimum thickness of 2 in. and a weight of about 12½ cwts.

In order to carry out this arrangement the brook was temporarily dammed at a point about 87 yds. above the upper end of the culvert, and the flow conducted along a trough over the land and by two troughs through the upper part of the culvert, so that the work could go on below. As each hole through

the invert was drilled, it was at once made good with wood driving plugs.

As the work proceeded, before removing the existing invert in any length, the interior of the culvert was carefully shored and stayed by strong centres, which were not removed until the consecutive castings were properly placed in position, and the brickwork at the sides made good and consolidated, the work being arranged so that not more than 2 ft. 6 in. of invert of the culvert was cut out at a time. As each length was cut out a few inches of grouted ground was removed from below it, and replaced by fine cement concrete. This was carefully formed by means of templates to the proper shape, and hammered down to its proper position.

The brickwork filling between the new invert and the old brickwork, being in the nature of underpinning, was grouted with cement mortar, 1 to 1, made very stiff and caulked with an iron tool. The V-shaped joints between the castings were similarly caulked, the connecting faces of each casting having been planed and fitted.

Although when the borings were made through the invert of the culvert a considerable pressure of water was present, when the old brickwork came to be taken out there was no difficulty experienced from subsoil water.

Cases of carrying sewers and outfalls over rivers were referred to. In these works cast-iron flanged pipes with faced joints ensured stronger work, and socketed pipes must not be used except when supported on girders. Reference was made to an overground line of pipes on piers, and the provision of expansion joints where considerable lengths are exposed to the effect of variations of temperature. Inverted syphons under streams or other obstructions were also dealt with, and the general necessity pointed out for their being laid in duplicate and provided with valves in manholes at each end, with sumps for cleaning out accumulated débris.

Mr. Platt said that, as a result of experience, he had in some cases provided a sump or débris chamber in the sewer approaching existing single-pipe syphons so as to intercept the accumulated débris, and thereby avoid the necessity of cleaning out the sump of the manhole at the end of the syphon.

The precautions to be taken in the preparations for crossing under railways were dealt with, especially the proper support of the running lines on long beams, and reference was made to the necessity of executing a brick sewer under the main lines in Rochdale a few years ago, under compressed air, through very treacherous strata at a depth of 50 ft. below the metals. Storm overflows were next mentioned, allusion afterwards being made to the present requirements of the Local Government Board of a weir over which no discharge shall take place into a stream until a predetermined degree of dilution has been reached of combined sewage and rainfall to continue to the disposal works.

[The canal crossing described by Mr. Platt is illustrated by a plan and section in the paper which Mr. T. de Courcy Meade, M.INST.C.E., the city surveyor of Manchester, read at a meeting of the Institution of Municipal and County Engineers held at Manchester, and reported in THE SURVEYOR of February 27, 1914.]

DISCUSSION.

Mr. J. A. SETTLE, borough engineer and surveyor, Bury, said that concrete tubes were very useful in some cases, but they required to consider very carefully if brick sewers were not more useful. For all large sewers he preferred to use bricks, as in Manchester. He did not think concrete would stand the action of chemicals as well as brickwork. They could not make such good joints with either the ogee or rebated joint of the concrete tube as with the earthenware or stoneware pipe. He thought the concrete pipes built up in segments ought to be surrounded by concrete. One could not test concrete pipes as one could test Accrington bricks. He would like to ask Mr. Platt how much rainfall he provided for in Rochdale. He should also like to know if they had any trouble from roots of trees getting into their sewers, as he had an area of 30 acres which was drained by rubble drains, and they got filled with roots of trees, although laid at a depth of 12 ft.

Mr. C. H. COOPER, borough engineer, Wimbledon, said they found tree roots 23 ft. deep in the London clay; he thought the trees were black poplars. Concrete was all very well where one had a sewer which was not movable; but in the London clay one had failures, especially on hills. Pipes frequently got smashed to bits, and yet carried sewage for years, and then they would go all at once. The amount of rainfall to be provided for in the sewers depended upon many things, but a fairly reasonable allowance was 25 cub. ft. per acre per minute on built-up ground. Referring to the manhole covers shown on the slides, he said he did not know of a good manhole cover. They were generally of cast iron, 5 in. deep, and if one got a heavy wheel on one side they either tippled or broke. Airlocks put an engineer in a far safer position for underground work. So much successful tunnelling had been done in recent years by pneumatic shields that it was now a difficult matter for anyone to claim compensation for his house being damaged by excavating. He did not think it was necessary to go in for the heavy (Accrington) engineering bricks mentioned by Mr. Platt. They got in London good stock and gault bricks quite suitable for this purpose, and very much cheaper.

Mr. A. J. PRICE, engineer and surveyor, Lytham, said he thought the trouble with roots of trees in sewers at a depth of 12 ft. to 23 ft. was due to the roots getting into branch drains with defective joints, and travelling down to the main sewers, though many old shallow sewers with clay joints were troubled with roots. He had frequently found branch drains filled solidly with roots for many yards in length. He thought for sewers above 2 ft. in diameter the concrete pipe was better than earthenware or stoneware pipes. Earthenware or stoneware pipes of this size could not be burnt without warping, and it was difficult to manufacture these pipes with a truly cylindrical shape, while the concrete pipe could be moulded to a proper circular form. The concrete pipe with either an ogee or a rebated joint had a much truer alignment, and if laid on a concrete foundation or encased in concrete, as all his sewers were, they made much more satisfactory work than the vitrified-ware pipes. They were easier to handle, quite as cheap and as strong and non-absorbent as the glazed pipes. With regard to the effect of chemicals on concrete sewers, he did not think there was any great reason for the fears of those engineers who preferred brick or vitrified-ware sewers on these grounds, as they quite overlooked the fact that in both these sewers they had to rely on cement for joints, and if chemicals were bad for concrete they were equally bad for cement joints. There was much greater danger from chemicals in the case of bituminous jointed pipes. At Widnes some years ago Mr. Sinclair, the borough engineer, called attention to the destructive effect of the chemical wastes in the sewers jointed with bituminous materials, and the pitch and sulphur of which so many patent joints were made were, in the speaker's opinion, much more likely to be badly affected by chemical action than cement joints. Where ramps were necessary for sewering steep streets he preferred an easy inclined fall rather than the vertical drop into a trap, as adopted at Rochdale. All traps in sewers were bad, and especially one with a high vertical drop in which the solid matter, falling from such a height, was liable to block the trap. He did not think the iron flap on the short rodding arm of the sewer was much use, as in his experience he had generally found them kept open by paper or solid matter which prevented them acting properly. It was now generally admitted that sewer air followed the flow of the sewage, and he was of opinion that all that was necessary in the way of ventilation and to avoid the danger of air travelling up the sewer was to fix tall ventilating shafts at the manholes where ramps were required, and dispense with the traps and flap valves, which were either useless or liable to create a nuisance.

Prof. RADCLIFFE said the materials of which sewers were made were of great importance. He had carried out a great number of experiments in the technical school with various materials, both as regards their strength and composition. He hoped at some future time to lay the results of these before the members of the institute.

The CHAIRMAN (Sir Henry Tanner) said he should like to refer to the use of concrete pipes, for the reinforced-concrete pipe was, in his opinion, a very superior thing altogether. Those made outside Paris (the Bonna pipe) seemed to be extremely good, and had proved very satisfactory at Swansea.

Mr. PLATT, replying to Mr. Settle, said the amount of rainfall to be provided for in the sewers largely depended upon the nature of the ground and the extent of the paved area. Referring to the methods adopted at Rochdale on sewers for steep streets, he said he had had no trouble with the flaps, which

only following the example of that fine sanitary engineer, Sir B. Rawlinson. The Barrow system of [illegible] papers was read at Norwich [illegible] most interesting paper on this subject was read before the Concrete Institute by Mr. J. Tingle. He agreed [illegible]

ECONOMY IN REINFORCED CONSTRUCTION.*

By [illegible]

[illegible] concrete for the external walls of buildings, as brick walls up to a thickness of 14 in. are cheaper; but when walls have to be thicker than this reinforced concrete comes in. As, under the proposed London County Council regulations, nearly all external walls need not exceed 14 in. in a framed building, it is probable that reinforced-concrete walls for this purpose will soon cease to be used from the point of view of economy.

With regard to the economy of reinforced-concrete [illegible] the London area the economy is very considerable; inside the London area the London County Council, by their regulations, [illegible] framed building even in London.

THE TIME FACTOR.

[illegible] tion of building operations of all kinds, and that is time, and I mention it in this connection because many people are of opinion that the quickest form of construction is steel construction, and if drawings [illegible] the steel framework has been fabricated beforehand and is ready for delivery the moment it is required, it may be that the steel frame is the quicker. But this is not always so, and starting from the same point—that is, the time when working drawings of both reinforced-concrete frame and steel frame are ready, generally some time after the foundations of the building have been started—it is possible, in ordinary times, to obtain steel bars in fourteen days from that date. But it generally takes six weeks to obtain built-up stanchions; so that at the beginning reinforced concrete gets a four-weeks' start.

Again, in steel-framed buildings many architects use coke-breeze concrete or broken-brick concrete between the R.S.J. fillers. Neither of these is watertight. Reinforced concrete 4:2:1 is practically so, and in a building constructed some years ago, seven stories high, I remember the plaster-work was started on the ceilings of floors below the fourth before the seventh floor was finished, and as each of the remaining floors took about a fortnight to do, another month or six weeks was gained on the steel-framed building, as asphalt on the roof would have been necessary to prevent rain coming through the breeze or broken-brick floors and spoiling the plaster.

It seems hardly necessary to mention that, in the construction of bridges, say, up to 300-ft. span at least, reinforced concrete is nearly always the most suitable material. There are, of course, exceptions, but the mere question of the cost of maintenance of a steel bridge seems to me enough to condemn it.

The question of maintenance is also enough to decide an architect or engineer to choose reinforced concrete for the construction of, say, small water towers, coal bunkers, gasometer tanks, or any similar structure heretofore built in steel, and exposed to atmospheric conditions, even if reinforced concrete is not cheaper in the first instance.

With regard to timber structures the same applies, and, in addition, the relatively greater resistance to destruction by fire makes the advantages of reinforced concrete so apparent that one wonders why timber is employed in the construction of what was at all.

WASTEFUL PROCEDURE.

But, to turn to the other side [illegible] may in which, in these strenuous days of competition, seems [illegible] enormous amount of waste which occurs through one of the methods adopted by architects to obtain cheap prices for the carrying out of work. An architect prepares the general design of a building, and sends sun-prints to four, five, or even six different firms of specialist designers, who in turn prepare each their reinforced-concrete scheme, and send out to five or six or even more contractors for prices, involving a total of some thirty to forty persons, all of whom spend money and time in tendering. Much valuable time is also wasted which might otherwise be spent in the construction of the building, while the various prices and schemes are being compared and adjudicated on. This puts an initial charge on reinforced concrete which might be avoided if the architect or engineer would only choose his system, or employ a consulting [illegible] forced-concrete work, and then send out for prices in the usual way.

One difficulty with centering is the amount of props required. If this is left to the foreman in charge of the work it is very likely that the number put in is either too many or too few, and I would suggest to contractors, what has often been suggested before, that great economies might be effected by employing a competent man to design the formwork.

Another point which makes for economy in reinforced concrete, but has more to do with design, is [illegible] to handle a 12-in. diameter bar 25 ft. long as it is to handle one that is only 1-in. diameter, as the weight is immaterial. Again, in this connection I would point out that the 12-in. diameter bars occupy less space in the width of a beam than the 1-in. diameter bars, and the labour cost on concrete may be reduced by 30 to 50 per cent by the employment of the larger diameter bar. Again, with fewer bars there are fewer ends, and, in many cases, stirrups or shear members to fix, and the smith's work is correspond- [illegible]

* Abstract of paper read at the last meeting of the Concrete Institute.

PUBLIC OFFICIALS ON MILITARY SERVICE.

A REDUCED ALLOWANCE.

[illegible] dent of the Local Government Board was asked—(1) The amount of salary paid to the inspector of nuisances in the rural district of Swaffham, Norfolk, prior to his joining His Majesty's Forces; the present amount of his allowance from the rural district council; and the present amount paid to the temporary inspector of nuisances; and (2) whether the Rural District Council of Swaffham, Norfolk, in August last granted their inspector of nuisances leave of absence for military duties during the continuance of the present war, and agreed to pay him half-salary during that period; whether on December 31st last that agreement was broken and the amount reduced by one-half; if so, whether the consent of the Local Government Board was specifically given to the reduction; and the grounds on which such consent was given.

In reply, Mr. Herbert Samuel said the inspector of nuisances to the Swaffham Rural District Council was appointed in 1913 at a salary of £100 per annum. He was a trooper in the King's Own Norfolk Yeomanry at the outbreak of the war, and as such was called out for service. The council resolved to reinstate him on his return, and to pay him a salary of £50 per annum during the continuance of the war. They appointed a temporary substitute at £50 per annum, and the board sanctioned these arrangements. In December the temporary substitute tendered his resignation, and the council induced him to withdraw it by increasing his salary to £75 per annum. At the same time they rescinded their resolution to pay the inspector £50 per annum during the continuance of the war, and passed another resolution to pay him £25 per annum during this period. The board refused to sanction this reduction unless the inspector consented to it, but on being informed that the inspector had been told of it and had made no objection, they gave their sanction. The inspector had now informed him (Mr. Samuel) that he had notified the council that he objects to the reduction, and the board were asking the council to reconsider the matter.

Economics of Town Planning in Relation to Land Development.*

By G. L. PEPLER, F.S.I., Town Planning Department, Local Government Board.

Perhaps I ought to preface my remarks by referring to the permanent Civil Service appointment that I have recently received, and to mention that this paper was in the shaping while I was still in private practice, and therefore I have not suppressed it, although, of course, the views expressed have nothing to do with my present official position.

The title of this paper was suggested to me. . . . Now I have come to set my ideas down it is borne upon me that I cannot possibly write up to such an ambitious heading. All I can attempt is to set out a few of the economic problems that I have met with in practice, with a view to initiating a discussion into this important side of the question: I refer to town planning in general as it may affect property owners, and do not restrict my observations to operations under the Act.

Why should landowners develop their land on town planning lines? Many of them have in the past cut up their estates profitably on the old lines, and what advantage can accrue to them by changing their methods? I do not wish for a moment to suggest that landowners as a class think only of their own interests, because experience has convinced me that this is very far from the case. The point I wish to make is that unless town planning is economically sound all its other virtues are of little practical use.

Our object this evening is not to discuss the rights and wrongs of the present property laws, but, taking things as they are, to consider whether town planning is financially sound as regards land development. In my opinion it is, and for the following general reasons:

I think it is true that more money has been made in the past out of land by the old methods than is being made now, even in cases where methods that we should approve have been adopted. This does not prove that our methods are unsound, but rather that past carelessness has queered the pitch.

To realise the present position it is necessary to look back a little. Up to about the middle of last century England was principally an agricultural country, and the growth of towns was comparatively slow. Buying a plot and building a house was a leisurely matter, as we can gather from the old estate and deed plans with their elaborate north points and headings, which must have taken hours to do, and were apparently considered of more importance than any attempt at accuracy in the plan. This was the kind of land-dealing machinery in operation when the great industrial revival came along and people flocked to the towns, which consequently grew at an amazing pace. Industrialism was the one thing in all men's thoughts—where and how the workers were to live was largely a side issue. Consequently hardly anybody looked ahead, and landowners with the rest mostly just sold off their land as demanded, often without restriction and without any thought as to the possible effect on the rest of their estates.

LACK OF FORESIGHT.

While the demand was insistent things went well for the landowner, but the day of reckoning was to come. In many cases over-speculation had been indulged in by the developing middlemen, which resulted sometimes in derelict estates, and in other cases the speculator, having bought without restriction, and only being interested in clearing off the block of land he had bought, altered his own restrictions halfway and sold off the balance for another purpose to the injury of both his original purchasers and of the large landowner from whom he had bought the block. One could give many instances of large estates that are now at a standstill because development was allowed to commence in this way without any general plan or conception, the result being that the attractions and amenities of the whole estate have been damaged. Not only has this lack of foresight spoilt the market for the rest of the estate, but frequently one finds extra cost entailed in roads and sewers because each block has been treated by its purchaser in the cheapest possible manner for his own ends alone, and consequently when adjoining land comes to be developed there is no general scheme to fit into, and money has to be spent that might have been saved, and efficiency has to be sacrificed. One has even met frequent cases where an owner has sold off frontage land that actually blocked him from proper access to develop back land.

There is no need to labour the point, as in these days the necessity of a comprehensive scheme in estate development is generally recognised, and that such a general scheme should include the settling of such matters as the position of the principal roads, the depth and gradient and position of sewers, the class of property suitable for each part, and the rotation in which the land should be developed, taking into account the effect on existing farm tenants. . . .

FINANCIAL CONSIDERATIONS.

Without question the more perfectly and the greater the foresight with which an estate is developed from the commencement, the greater will be the ultimate value, as all that is accomplished, if well done, should enhance the future value. Many owners realise this, but then comes in the question of immediate finance. They are quite willing to have a scheme prepared, but they lack the means to carry it out. In this respect it is well for any town planner called in to advise to bear in mind that in framing his scheme the first thing he has to consider is the financial resources of his client; and, secondly, the type of demand for which the estate has to cater. It is futile to put on paper a grandiose scheme, including great boulevards, "places" for grand public buildings, and roads set far apart, when your client cannot possibly afford to carry out the conception, and the demand is for cottages for which a depth of 150 ft. is ample. Another difficulty is that plans by themselves are not convincing, as very few people can read plans; what is essential is some actual examples both of buildings and types of roads, &c. The difficulty is to provide these examples. Probably arrangements can be made for the roads and sewers, but as regards buildings there is much greater difficulty, and this difficulty is particularly patent in the case of settled estates, or where the ownership is otherwise restricted and plots can only be leased, or, if sold, the proceeds cannot be used for erecting buildings. . . .

The speculative builder is a much maligned person, but one should bear in mind that he is the man who, up to now, has almost entirely met the housing demand, and as he is usually a pretty shrewd person, one can be sure that, on the whole, he has been giving the public what it wants. Therefore one should study carefully his achievements, and, rather than destroy, see how they can be adapted to more artistic results without increasing the cost appreciably. A great deal can be achieved in this way, and by degrees one can hope to arrive at a house that not only satisfies the artistic eye, but also "fits" the ordinary man, who has got used to one style and fears discomfort from too sudden a change.

OPEN SPACES.

It is not only as regards buildings that financial difficulties arise; there is also the question of open spaces. One may show them on paper, but who is to make them, and how are they to be maintained?

If a fairly large block of land is being sold or leased to a tenant society there should be no difficulty, as such an organisation can raise funds for laying out and maintaining an open space; but in cases where plots are being disposed of separately, it is more difficult to obtain concerted action. The general feeling seems to be that such things should be thrown in by the owner, and that he should bear all costs of construction and maintenance, and at the same time should charge no more for his land. Such a view, to my mind, is quite unwarrantable, but it has to be reckoned with. Where the demand for land is great it is an easy matter to put an annual charge on each plot, but where one is coaxing purchasers they cannot be dealt. In some cases the simplest and best solution may be to hand over the open space to the local authority, if they will take it; but this means that it will be thrown open to all, whereas, if larger houses will surround it, most residents would prefer

*From a paper read at a meeting of the Town Planning Institute held at Westminster last Friday.

more limited use. Usually, I think, the best method is for the owner to lay out the open space if he has the funds, and then either charge for admission to the whole by letting out keys to residents, or reserve part for tennis courts, &c., which can be let to clubs at a total rent sufficient to cover the cost of outlay, interest and general upkeep.

RESTRICTIONS.

Another problem that has a financial bearing is that of estate restrictions. . . .

As to what one should insist on, I think that in the past too much emphasis has been laid on a mere money restriction. It is probably necessary to insist on certain minima, but the design and character of a house are far more important; indeed, who would not far rather see a small house on a big plot than a big house on a small plot? and, within reason, most would prefer it for a neighbour.

The most important restriction, perhaps, is as to the use that the property may be put to, and next that the design should be approved by a superintending architect. This means a good deal of trouble to the superintending architect, and trouble for which the purchaser cannot be expected to pay in full, but which it is well worth the while of the landowner to recompense. The architect in charge should let the purchaser know at the earliest possible moment the type of design that is suitable, so as to prevent a false start.

Also, I suggest that it is well to state in the sale conditions what materials are barred for outside work—such as naked Fletton bricks and blue slates, in most cases—and this is particularly necessary where you are trying to pull together an estate that has been started on careless lines. The minimum pitch of roof should also be stated; in fact, failing examples, the more clearly you indicate the type of house you desire the less likelihood there will be of misunderstanding and unnecessary trouble. Again, the type of fence, wall or hedge needs carefully settling, as nothing looks worse than an incongruous mixture; one has to remember in regard to this that everyone is entitled to have at least a dog-proof boundary. . . .

CONCLUSION.

Practically all classes of development have had to conform to by-laws that were general in application, and could not be varied to meet particular cases. In the past, no main traffic routes having been provided, trams and 'buses have often been brought along insufficiently wide and ill-adapted streets to the consequent deterioration of all the residential property fronting thereon on account of the noise, dust and danger. There are often rights of way across land that make it extremely awkward to use the latter for building purposes. To divert any of these has been a long and comparatively expensive business, each having to be the matter of a separate application, and, under the general law, only permissible under certain conditions which cannot always be fulfilled, and which it is not always desirable to fulfil.

Quite frequently estate boundaries are not at all convenient when building development is desired, and lead to waste in the plotting and road making. The alternative was for the owner who first wished to develop to make some arrangement with his neighbours, and this was often a difficult matter.

These particular difficulties of estate development all meant expense to the owner and tended to lack of efficiency. A town planning scheme gives the opportunity for all these disadvantages to be cleared away, and it can provide settled conditions which are a great attraction to purchasers. By-laws can be adapted to express local requirements, and thereby expense is saved and frequently extra beauty obtained. The position of future open spaces will probably be settled, so that the owner will have definite attractions to offer. Estates can be developed to take advantage of routes intended for main traffic instead of, as previously, there being no certainty as to the routes main traffic would follow. Probably by giving up land where properly required for main routes, owners will be permitted to make narrow residential roads, and thus save expense in development. All rights of way can be dealt with together in consideration of the general plan, and without the Highway Act restrictions. One could enlarge the point, but perhaps I have said sufficient to make clear that the Town Planning Act, if properly understood and taken advantage of, should prove of real financial benefit in estate development.

DISCUSSION.

At the meeting of the Town Planning Institute at which the foregoing paper was read, a discussion was opened by

Mr. E. WILLIS, engineer and surveyor to the Chiswick Urban District Council, who proposed a vote of thanks to the author. There were, said Mr. Willis, a great many points of interest in the paper, and he thought the title gave them food for discussion. The remarks he was about to make were, of course, without prejudice, for probably he would not be voicing the feelings of his council; but he had been engaged with a great many estates, both in private practice and, since then, in connection with his present work, and there were numerous cases of small properties, covering practically thousands of acres, where town planning was bound not to be economical from the owner's point of view. If one gave a cottage an unnecessary amount of garden there was certain to be a loss to the owner. Where the tenant made a hobby of gardening it was an advantage to give a large amount of garden to a cottage, or, say, an ordinary villa. Although he personally had a small garden, he was sorry to say that it had usually looked rather derelict, unless he had employed someone to attend to it, and he thought most suburban residents were satisfied with a small garden. In town planning they might be well advised, in laying out squares, or such like, especially in connection with small property, to lay out in such a manner that there was provided a garden that could be utilised by the various residents in the form of allotments, but with restrictive powers, so that those who took an interest in gardening would have what was practically an allotment in the ordinary sense of the word, though more for the purposes of their hobby than for anything else. Then, as regarded roads, the cost of these was, of course, very great when they put a large number of houses on a small area, and was a very greatly increasing item. Formerly, however, it was not so great, and that was why the old property owners made a great deal out of their estates. He was a great believer in town planning, and would still advocate it for urban areas throughout the country; on the other hand, he would advocate subsidising it, for if they were going to treat the landowner fairly they must subsidise him if they intended to cut his property about, particularly if it affected his pocket; and he thought the time would come when local authorities would have to subsidise town planning—though he said it without prejudice. They must not expect to get everything from the landowner. He would benefit if he developed on large lines, but the man who developed on small lines was not so likely to benefit by a town planning scheme. He thought that what they had really got to aim at was to educate the owner up to public spiritedness. That brought them to the question of open spaces. Local authorities did not always want an open space before an estate was developed, and they could not afford—especially the smaller bodies—to lay out an open space in the way that probably it should be laid out to draw the people to a district, and yet it was needed very often to attract people and develop the land. He considered it would be quite possible for a clause to be inserted in a town planning scheme partially to subsidise these open spaces, so as to start them, and thus gradually draw the people to an estate and expedite the development. That was a very strong point in a paper—the question of speeding up development—and anything tending to that was going to benefit the district and the landowner, two points which should be considered together.

Mr. C. J. JENKIN, engineer and surveyor to the Finchley Urban District Council, observed that Mr. Pepler's paper was most interesting, and of the type that led to beneficial discussion without being dogmatic. The author had said that the Town Planning Act was not thoroughly understood. That struck at the root of the economic difficulty of town planning. One could not get people to appreciate that good development would in every case be to their benefit, and if that could be instilled into the minds of owners—especially small owners—it would be a good thing attained. The Town Planning Act was for the future, and in the matter of gardens they were hoping that town planning would inculcate a love of the garden, in addition to other things. An owner could not always recognise that the assets of lands were not the immediate turnover, but the health of the country. He could not see that it was to his advantage to develop on good lines. Land was sold to a

building owner, and he wanted to get rid of that land as soon as possible. He developed it very badly, and that was one of the great difficulties. With reference to land about cottages, that was one of the difficulties met with in designing, and he agreed that the allotment would be more attractive than the garden to the cottager. There were owners and owners—some enlightened and some not. All owners were not rich, and had not the means to develop their land, and there ought, he thought, to be an arrangement by which authorities could obtain a loan from the Local Government Board and advance money to these owners, under restrictions. His own council had acted on that idea in many ways, especially in the matter of drainage—a subject in regard to which he considered they heard too little at the meetings of the Town Planning Institute. A man said, "I cannot afford to lay sewers." The council were under no obligation to lay sewers until the houses were erected and ready for drainage. His authority therefore tells the owner they will construct the sewers for him if he will pay the council capital and interest until such time as the sanitary rate on the houses to be erected wipes out the sinking fund, and the amount the owner had to pay decreased with each house that was erected on the site. He did not think the owner wanted any advance on open spaces. With the good owner there was little difficulty. He would have his houses well designed, but as a municipal engineer one saw only too frequently cases in which builders got a plan of a house from an architect, and the office body took tracings from it *ad nauseam*. That was helpless in getting amenity and a home which people could enjoy. Some of those points represented difficulties in dealing with small ownerships. If they could only insist that every house should be designed by an architect that difficulty would be removed.

SHELLFISH FROM SEWAGE POLLUTED WATERS.

NEW LOCAL GOVERNMENT BOARD REGULATIONS.

The Local Government Board have issued to port sanitary authorities, metropolitan borough councils and councils of boroughs, and urban and rural districts copies of an Order [No. 57,553] containing regulations prohibiting the sale of shellfish likely to cause danger to public health.

Numerous representations, it is stated in a covering letter, have been made by local authorities to the board to the effect that further powers are required to prevent danger to health from the consumption of shellfish which have been grown or fattened in polluted waters, and these were submitted to the Royal Commission on Sewage Disposal. The Commissioners stated in their fourth report that they were satisfied, after carefully considering the whole of the evidence on the point, that a considerable number of cases of enteric fever and of other illness were caused by the consumption of shellfish which had been exposed to sewage contamination, and they made certain recommendations for preventing the sale of polluted shellfish for human consumption.

Opportunity has not yet arisen for altering the law in the way recommended by the commission, and the present Order has been made with a view to the provision of an alternative procedure under powers which the board already possess. In framing the regulations the board have taken the opportunity of consulting the Fishmongers' Company, and several suggestions made by the company have been incorporated in the Order.

Machinery is provided by the regulations for the closing of shellfish layings in regard to which there is evidence to show that shellfish from such layings have actually caused infectious or other disease, or are likely to be a source of danger to public health. The power to close layings is vested by the Order in the sanitary authority of the district in which the layings are situated, and a right of appeal to the board is provided for in the particular cases specified in Articles VI. and XI. of the Regulations.

The sanitary authority of the district in which the layings are situated are required to take action on receipt of a representation from another local authority, in whose district the shellfish are consumed, indicating that the shellfish have caused or are likely to cause, infectious or other disease, or, on the report of their own medical officer of health if such shellfish are found in their own district.

Apart from any representation from another district, the medical officer of health of every district in which shellfish are laid is asked to examine the conditions of the layings in his district and report to the local authority any cases in which the layings are so situated as to be liable to dangerous contamination, with a view to steps being taken under the Regulations to prevent shellfish being distributed for sale for human consumption from such layings unless the shellfish have been relaid in fresh water for a period sufficient to free them from contamination. The board are advised that, as a general rule, the period of relaying required to rid shellfish of micro-organisms should not be less than a fortnight.

In this connection the board consider it of great importance that any action taken with a view to the closing of a laying should be based rather on epidemiological and topographical considerations than on the results of bacteriological analysis. On this point they refer to the findings of the Commissioners on Sewage Disposal, who in paragraph 64 of their fourth report state that in their opinion they would not be justified in recommending "that the closing of a foreshore, laying or pond should depend, as a matter of routine, on the results of a bacteriological examination." They also direct attention to the following extract from that report:—

> "65. It will be seen from the evidence of Dr. Bulstrode and others that in the great majority of the cases in which outbreaks of disease have been clearly traced to shellfish, the foreshores, layings or ponds from which the shellfish have been procured have been so situated that the opportunities of pollution by sewage have been obvious and indisputable. That is to say, the foreshores, layings or ponds in question were such as would have been condemned on a careful examination by a trained person without the aid of bacteriological examination of the water or the shellfish. Having regard to the number of such foreshores, layings and ponds obviously liable to pollution which Dr. Bulstrode has noted in England and Wales, and Dr. Browne in Ireland, we think that in the light of experience we are justified in concluding that, if those were closed, or else freed from chance of pollution, the greater number of cases of disease due to the consumption of contaminated shellfish would be eliminated."

The Regulations will take effect from Monday next, March 1st. The board are anxious to secure uniformity in the administration of the Regulations, and will be glad to have their attention drawn to any cases of difficulty which may arise.

ROAD BOARD GRANTS.

COUNTY COUNCILS ASSOCIATION'S ACTION.

On Tuesday, at the annual meeting of the Council Association, held at Westminster Guildhall, Lord St. Aldwyn, referring to the subject of Road Board grants, said it was hoped that they would be able to persuade the board to continue to make grants for surfacing work, and that they would be able to induce the Local Government Board to get rid of the fear that the money might be needed for the relief of unemployment—a contingency which, in his opinion, would not arise during the period of the war. His lordship mentioned that he knew of several county councils who had incurred capital expenditure on the strength of getting grants from the Road Board, and if the board did not fulfil its obligations it would be bad for everybody.

At a meeting of the Executive Council of the association, held on the following day, a proposal that the Treasury should be urged to consent to the Road Board continuing its annual grants towards road reconstruction and road crust improvement in the counties, and that the Chancellor of the Exchequer should be asked to receive a deputation on the subject, was agreed to.

Volunteer Women Tramway Conductors.—Ladies of independent means are said to have offered to act as conductors on Edinburgh tramcars, and to hand their wages to [illegible] dependants of soldiers. At Newcastle the tramway manager's hint that women may be employed has brought a very strong protest from the present employees.

INSTITUTION OF MUNICIPAL ENGINEERS.

NORTHERN DIVISION ANNUAL DINNER.

The annual dinner of the No. 1 (Northern) Division of the Institution of Municipal Engineers was held in the Royal Turks Head Hotel, Newcastle-on-Tyne, on Saturday, the 14th inst., Mr. William Pearce, county surveyor of Cumberland, chairman of the Northern Division, presided, and amongst the company of sixty was the Sheriff of Newcastle.

The loyal toasts were [illegible]. Replying to that of "The Navy, Army and Allied Forces," Captain Tatton observed that he [illegible] work as a Royal Engineer in the Volunteer Corps, he had been brought into touch with a very large number of the local authorities. When they had required work to be done by the [illegible] frequently been the case, it had nearly always to be done in a great hurry. The assistance and help he had received from the authorities and their engineers had been most willing and most generously given, and he hoped that [illegible] of municipal engineers and surveyors would not be forgotten.

"The Local Government Board, Road Board, and Administrative Bodies" was proposed by the CHAIRMAN. The Local Government Board, as they were all aware, was formed for the purpose of governing schemes and expenditure of local authorities, and, as public engineers, they looked to the Local Government Board rules as their chief guide in the carrying out of their various duties. His own opinion was that by giving the ratepayers an opportunity of attending public inquiries to lodge their objections to any particular scheme, the engineer responsible for the scheme could go on with greater confidence after the approval of the board had been given. [illegible] Government Board [illegible] engineers in carrying out large and important schemes. Also the granting of a portion of the salaries of certain officials to local authorities very often enabled councils to offer better salaries to properly trained officials. There was one thing which had not yet been done, and which, in his opinion, rested with the Local Government Board—that was, to support a Bill in Parliament to grant to all public officials superannuation and security of tenure. This matter, he felt sure, would very soon occupy the attention of the Local Government Board, and he sincerely hoped that their request in this respect would have the full approval of the board and that they, as local government officials, would enjoy the same benefits as civil servants and Poor-law officers. With regard to the Road Board, he felt sure that all road engineers who had taken advantage of the purse of that authority must admit that they had been able to do much more surfacing work than they could have hoped to do without its assistance. He had heard it said that the Road Board existed only for the benefit of county councils, and that rural district councils derived no benefit whatever from the board. In the meantime this might, to some extent, be true, because it is natural that the Government were desirous that all main trunk roads carrying heavy through traffic should be strengthened and put into good repair [illegible] consideration would be given to other roads where the traffic was not so excessive. There was no doubt in his mind that the board since its formation had made rapid strides in the right direction, and that its future policy would meet with general approval. As to the administrative bodies, it was to these that they, as officials, had to look for their bread and butter, so they might say that the administrative bodies were first and foremost in their minds. A council of any kind could not, in his opinion, be too careful in the appointment of its various officials, and full consideration should be given to the amount of salary to be paid to these officials. A man who was worthy of his position under a council was worthy of adequate remuneration. The great mistake that was often made by smaller authorities was in offering too small a salary to secure the services of a properly qualified [illegible] official, as a good and properly trained official could very often save his council considerably more than the equivalent of his salary each year. The comfort of the public depended upon engineers to councils. They required to have the very best roads and footpaths, and, in water schemes, water of the very best quality; and then there were sewage matters, lighting, and other things which all required the careful attention of the engineer. The comfort of the official chiefly depended upon [illegible] council, and in these days when officials were expected to cope with all kinds of local government regulations and new works they should have the full support and appreciation of their councils.

Mr. Alderman DIXON (vice-chairman of the Cumberland County Council), in replying to the toast, remarked that the bulk of the members of councils seemed to go to their meetings with the chief idea of keeping down the rates as low as ever they possibly could, to do as little work as possible, and to pay the surveyor as small a salary as they possibly could; but he was pleased to say that in the future, in his opinion, a better spirit of affairs would obtain. If councils wanted properly trained officials they should pay a reasonable salary.

"The Institution of Municipal Engineers" was proposed by Mr. T. M. CARLISLE. One [illegible] of the institution—a very valuable institution indeed—was to make themselves more accountable to the public, and to show that the services that they had rendered had been given in the best spirit, and a spirit which required necessary compensation. By meeting together and holding discussions they were [illegible] themselves good, but [illegible] the councils they served. The institution was only a young one, but he thought it was a very happy augury for them that they could muster something like 1,000 members, and he was sure that if everybody was imbued with the same spirit as the president (Mr. Matthew Jones), the success of the institution was assured. He coupled with the toast the names of the president and Mr. C. W. Hall, of Felling.

The PRESIDENT, in responding, observed that public bodies owed a great deal to their officials. It had always been his endeavour when at home never to take on more work for his council than he could accomplish, and he believed that if surveyors and engineers generally speaking would do just what they could, and when their councils said "We want another little job doing," were straight with them, and told them that their time was already fully occupied, it would stop all this extra work being put on surveyors for the same salary as when they were appointed. It appeared that the majority of councils endeavoured to get as much out of the engineers as they possibly could without granting extra remuneration. He did think that it was for the institution members to stick together, and to say, "We are going to do what we can, and we are going to do it well." If they took on too much work they could not do it satisfactorily either to their councils or themselves. Their institution was not yet, as Mr. Carlisle had said, in its teens. They were only seven years old, and had 960 members. He hoped that when they had reached their majority they would be as influential a body of municipal engineers as there was in the country, and he thought the way they were going on pointed to every success. Great credit was due to the members of the No. 1 (Northern) Division for the way they attended their district meetings and carried on their business, and it was a great pleasure for him to be there that night. In the Southern District it was difficult to muster a sufficient number of members to hold meetings at all. As president this year he was going to attend one meeting in every division, and he hoped that at the end of his term of office the membership would be greatly increased.

"The City and County of Newcastle-upon-Tyne" was proposed by Mr. J. JARDINE, town clerk, Morpeth, the SHERIFF OF NEWCASTLE responding. "Our Guests and Visitors" was proposed by Mr. J. H. HALSTEAD, surveyor, Knaresbrough Rural District Council, Mr. RICHARD AMES (London) replying.

Special Fire Survey Force.—Owing to several members having obtained commissions in the Army, there are now some vacancies for architects, civil engineers, building surveyors, and insurance surveyors who are prepared to act in a honorary capacity on the Special Fire Survey Force, whose headquarters are 8 Waterloo-place, London, S.W. Professional men are required to give on the average one day per fortnight (generally Saturdays). They should be men of experience, perferably over thirty-five years of age, and the districts in which further assistance is specially required are: Cornwall, Durham, Gloucestershire, Somersetshire, Warwickshire, Wiltshire and Worcestershire.

Bituminous Road Construction.

DRYING AND MIXING MACHINERY.

At the present time there is a great deal of matter published in general and in technical papers putting forward elaborate statistics and comparisons relating to the trade of this country as compared with its allies, its enemies, and the various neutral countries.

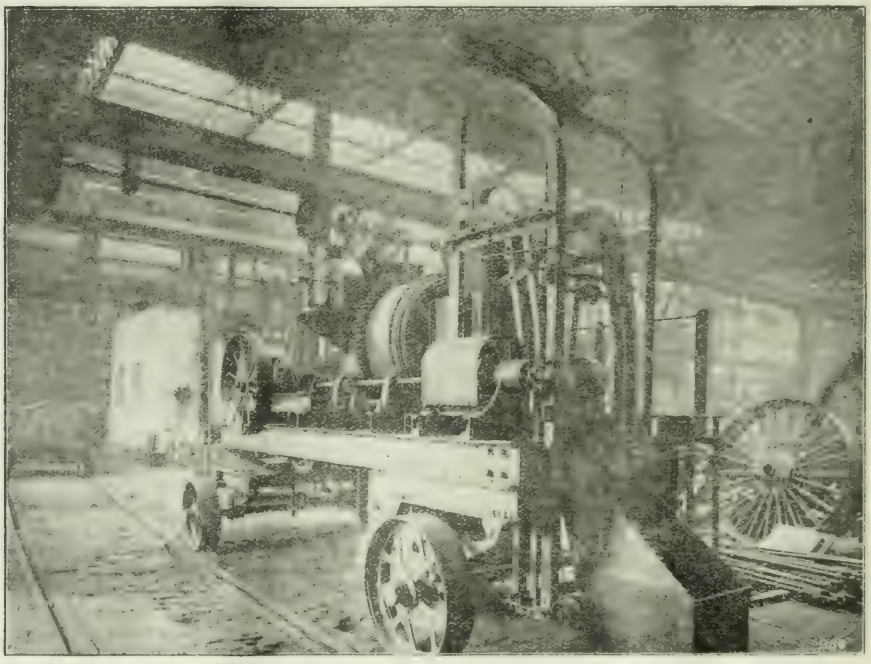
In many cases these comparisons give proof that this country is not so far advanced in its development and application of science to industry as is the case in other countries. There is one particular sphere of industry, however, in which it may be said, we think without contradiction, that the British Empire is second to no other country in the world. We refer to the science or industry of road making.

Historical works show that almost from time immemorial the question of roads, their construction and maintenance, has been a matter of material interest, experimental investigation, and practical test. While the construction of roads in the bygone ages, from an historical point of view, is well worth study, it unfortunately does not offer any great encyclopædia of information as to what are the most practical lines upon which present-day road construction should be carried out. The conditions under which roads need to be constructed and maintained at the present time are so entirely different from the conditions which prevailed even fifty years ago that engineers are still investigating and experimenting with a view to obtaining roads which are capable of performing their requisite duties.

The introduction of mechanically propelled vehicles moving with comparatively high velocity, and carrying what our forefathers would consider to be abnormal loads, has created what might be termed a "road revolution," with all the consequent alarms, necessitating the introduction of entirely new means of preserving highways from rapid and total destruction. Roads which under ordinary horse traffic have been looked upon as of solid and sound construction, presenting a comparatively smooth and uniform surface, have, under the influence of mechanical vehicles, become with great rapidity a mass of holes and ruts combined with either an abnormal and dangerous quantity of mud, or, in the dry weather, an objectionable amount of dust.

This rapid deterioration of the roads under modern traffic, however, soon established the fact that the old method of binding the road crust by means of water was no longer an economical and satisfactory procedure on highways used by any considerable quantity of heavy and fast-moving vehicles. Many forms of road construction have been introduced to supersede the old water-bound macadam road, but their introduction, while from the usage point of view perfectly successful, has been limited owing to the almost alarming increase in the cost of the road when so prepared, the result being that it is only in large towns and cities that it has been in any way possible to contemplate their use.

Mechanically propelled vehicles have, whether used for pleasure or industry, a very large radius of action



RANSOME COMBINED DRYING AND MIXING PLANT (FIG. 1).

from their home stores, and it has therefore become in many cases absolutely essential to treat not only the roads within large towns and cities in some improved way, but also the main trunk roads connecting such towns and cities.

We think we are justified in saying that of all the modern means of road construction the one which has been most extensively adopted is that in which tar or bitumen is used as a binder for the material forming the road surface. At the present time there are in existence roads constructed in an almost infinite variety of ways, all having as their basis some combination of stone, slag or sand, with tar or bitumen.

The construction of such roads has automatically created the necessity for machinery capable of producing the road material in such a way that the tar or bitumen used as a binder is thoroughly incorporated with and completely covers the various stone ingredients of which the road is constructed, as very early experience in this class of road clearly demonstrated that it was doomed to failure unless every portion of the stone or sand used in construction was efficiently uniformly and entirely coated with the binder.

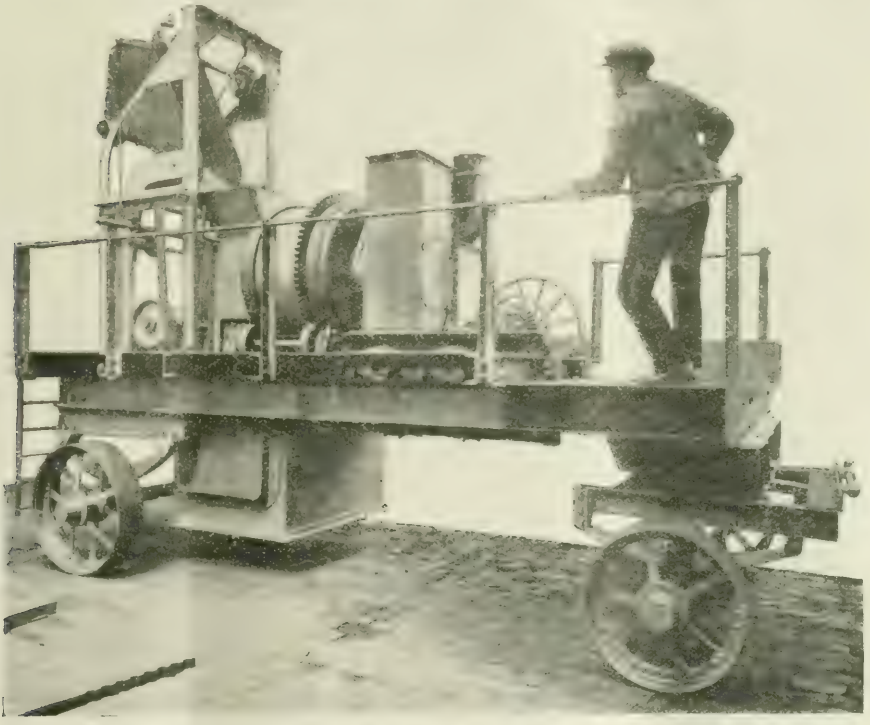
Many types of machines for producing tar-macadam

or bituminous carpet have been introduced from time to time, but their objections have generally been that their successful application was limited to one particular formula for making the road, the difficulty being in the past that, whereas a machine was found quite satisfactory for mixing, for argument's sake, large stone with tar, the same machine, when applied to mixing small stone or sand with bitumen, was by no means a success.

Experience has proved that there is another very important factor governing the creation of a successful tar or bituminous road, quite apart from the mixing of the material before it is put into place, and that is the drying, and, in some cases, the heating to a comparatively high temperature of the stone or sand before it is coated or incorporated with the binder. It is now generally recognised that efficient and thorough drying is absolutely essential if the most satisfactory results are to be obtained, and it is also known that when bitumen is used as a binder the stone or sand must not only be thoroughly dried, but also raised to such a temperature that when the heated bitumen is added to it the whole may be efficiently mixed without the binder being cooled so that it cannot thoroughly cover the stone.

It will be appreciated that the many varying elements connected with tar or bituminous road construction have created for the manufacturers of machinery for the production of the material many difficult problems to the solution of which they have devoted a great amount of time, and have conducted a large number of experiments.

For any given plant it is obviously desirable that the drying process and the mixing process referred to above should be carried out in the same machine. On the other hand, there are essential differences between the procedure necessary to dry the stone or sand and the procedure necessary to mix those materials with the binder. It follows, accordingly, that the two processes cannot be too closely associated without a resultant detriment to the mixture; therefore, while the plant which is to be used for the drying and the mixing should for preference be one compact unit, where necessary capable of being hauled along the roads on a single underframe, the actual vessels in which the drying and the mixing are carried out should be quite independent, so that there may be no confusion or overlapping between the drying and the mixing processes. There is another important point which must be borne in mind, especially when the production of bituminous carpet or bituminous macadam is under consideration -viz., that there is no object served in heating the material after drying to a temperature of, say, 400 deg. Fahr. if a considerable proportion of that heat is lost by the material before it is incorporated with the bitumen. From this it will obviously be seen that the action of transferring the stone or sand after drying and heating in the drying vessel to the vessel in which the mixing will take place should, under ideal conditions, be almost instantaneous. Again, while it is obviously an advantage that the hot gases used for drying the stone or sand should come into intimate contact with the material, it is just as desirable that such hot gases should not come into intimate contact with the binder, whether tar or bitumen, as if such is the case there is a very strong possibility that the binder may become overheated and certain of the essential oils contained therein evaporated, resulting in a reduced elasticity of the binder, which will show itself ultimately in the rapid crumbling away of the road surface constructed.



Side View of Ransome Machine (Fig. 2)

Space does not permit us to deal with all the various factors which have to be taken into consideration in the design and production of an efficient combined drying and mixing plant for road work, as a comprehensive review would easily form the subject-matter of an independent text-book, which, incidentally, we think, would be welcomed by engineers and surveyors if it contained information obtained from actual experience which could be thoroughly relied upon.

We suggested in the opening paragraphs that the question of road making was one of active development within the British Empire, and in this connection, more especially at the present moment, it is interesting to learn that the Municipality of Bombay, India, have recently invested in a combined portable plant for the production of bituminous macadam, from which it may be inferred that India is in no way behind the other parts of the Empire in the construction and development of modern roads.

Some considerable time back Mr. B. H. Hewett, the engineer of the Bombay Municipality, was busy in this country studying the methods of road construction employed and the machinery used therewith, and, as a result of his investigations, the municipality ordered from the Ransome-over-Mehu Machinery Company, Limited, of Brunswick House, Westminster, the machine illustrated in Fig. 1. This illustration is a view taken from the back or feeding end of the plant, and shows very clearly the elevating skip at ground level ready to receive the batch of stone to be subsequently dried within the drying drum. Fig. 2 is a side view of the machine, which shows clearly, first, the substantial road wheels upon which the whole plant is mounted; secondly, at the back end the elevating skip which feeds the stone to the machine; thirdly, the rotating drying drum, adjoining the elevator, below which is suspended the furnace; fourthly, the baffle box and fan, a little to the right of the drying drum, below which is, and suspended midway on the underframe, the mixer.

We are indebted to the Ransome-over-Mehu Machinery Company, Limited, for the following description of the machine:—

Capacity.—The machine illustrated diagrammatically in Fig. 3 is designed for an output of 30 cub. yds. per day of ten hours of mixed material.

This output will vary considerably, according to the nature of the stone or sand being used at any given time, and, as previous experience shows, is capable of being materially increased under favourable conditions and efficient working.

Weight.—The complete machine as described weighs approximately 8 tons 10 cwt.

Horse Power.—The power required to operate the machine is 7 to 8 b.h.p.

Batch Capacity.—The machine works on the batch principle, and a batch constitutes 6 cub. ft. of material.

Fuel.—The furnace is arranged for burning coke, and wherever possible this fuel should be employed, although at times a certain amount of wood fuel is not objectionable, provided excessive smoke is not caused by the combustion of the wood.

Portability.—The complete machine is mounted on serviceable road wheels fitted with springs, fore-carriage and draw-bar. When the machine is at work, however, the road wheels should be securely blocked, and the elasticity of the springs should, for preference, be eliminated by packing between the underframe and the springs.

Feeding.—The machine is fed by means of an elevating skip which descends to ground level at the back end. This skip will hold the batch required—6 cub. ft.—and is supplied with clutch, brake and automatic knock-out. The clutch, which operates on the coil principle, should be maintained with at least half a pint of good, heavy machine oil within the casing. It is not essential that the brake should be lifted when the skip is being raised, but it is desirable as the wear and tear and the load upon the winding gear is diminished thereby. The skip on reaching its discharge position causes its load to descend through an intermediate chute or hopper into the drying drum, which is continually revolving.

Drying Drum.—The length of time any batch of stone or sand needs to remain within the drying drum is very largely dependent upon the atmospheric conditions and the amount of moisture present in the stone as it is delivered to the drying drum.

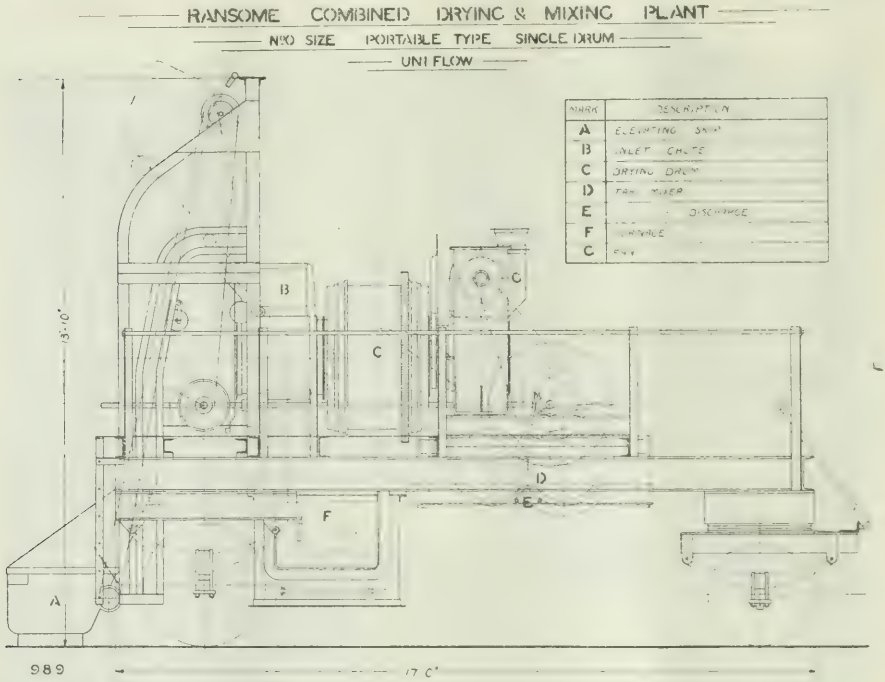


FIG. 3.

Sand will require a greater length of time to dry than stone, and the small stone, as a rule, longer than the large stone. Working on any one day with a uniform size of material, it is generally possible to determine, by carefully observing the first batch passed through the machine, the length of time required for drying the various batches on that particular day.

Discharge.—After the stone has remained within the drying drum for the necessary length of time, it is discharged by means of a chute, under the control of a hand lever situated near the mixer.

Mixer.—The mixer, which is constructed on the double-axle principle, is so arranged that the stone rapidly becomes incorporated and coated with the binder, the average length of time required for complete mixing [illegible] two and a-half minutes, according to the nature of the stone being mixed. It should be noted that immediately the dried batch of stone enters the mixer the next succeeding batch of stone may be lifted by the elevator and caused to enter the drying drum, so that drying and mixing take place simultaneously.

Discharge from Mixer.—Discharge from the tar-[illegible] is controlled by a hand lever operated from the working position. There is no

ground level, so that discharge may take place direct into trucks or carts, as may be necessary in circumstances.

Mixing Blades.—The mixing blades within the tar- [illegible] are of special design, and are arranged [illegible]

Furnace.—The furnace is [illegible] ground [illegible] may be regulated by controlling the fire-door and the ashpit [illegible] in such a manner as to give greater efficiency [illegible] to obtain economy in working, to obtain [illegible] heat is generated.

Working Platform.—A working platform is provided along the side and the front of the machine giving access to the elevator, discharge from the drying drum to the [illegible] to the carts.

Fan.—The hot gases from the furnace are caused to pass through the drying drum under the influence of a fan [illegible] mixer.

In conclusion, it is interesting to note that the machine described above, similar to many which the company have provided to municipalities and contractors in this country, and the results obtained, both from the point of view of efficient drying and mixing, and the minimum amount of labour involved, are extremely satisfactory.

Change of Address. The Dussek Bitumen Company forward us notice of change of address to their additional works at Empress Wharf, Sherman-street, Bromley-by-Bow, E. Certain of the firm's products will still be manufactured at their Deptford works, but all correspondence should in future be addressed to them at the new address.

Electricity for the Working Classes.—The Hull Corporation Electricity Committee have instructed the engineer to prepare a report as to the practicability of supplying electricity to the houses of the working classes. It was stated that with metallic filament lamps, and current at 6d. per unit, electricity would be a cheap illuminant.

Heavy Goods Traffic on Tramways.—A correspondent supplies some further particulars of the scheme of the Leeds Corporation referred to by one of the speakers at the recent Northeastern District meeting of the Institution of Municipal and County Engineers at Doncaster (p. 225 *ante*) for carrying heavy merchandise on their tramways, and so lessening the damage to paving and tramway tracks caused by horse-drawn lorries. It is proposed to employ specially-designed wagons to carry 10 tons each and to be drawn by electric locomotives. As mentioned in the discussion referred to, the charge for transporting goods by this means is calculated at 4d. per ton mile.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Do the [illegible] ways in which the civil population can help in this great war? Was it not a very good idea on the part of the Lambeth Borough Council to issue the following notice to ratepayers?—

"Removal of refuse costs money, wastes labour, necessitates destruction, and hinders personal needs. In the interests of public health, and to help your country and your sons, put all household rubbish."

Is this not an excellent circular, and could not an extension of such suggestions be usefully carried out throughout the country?

* * * *

Apropos of the above, would it not strengthen the hands of the Government enormously if civilians of all classes endeavoured to help in every way in their power to make it easier for the Government to carry on the war without being hampered by the selfishness of the individual?

* * * *

Have the [illegible] *Ingworth v. Barrow Borough Council* case of peculiar interest to all surveyors? Would it not be a "consummation devoutly to be wished" if the law courts could decide, once and for all time, whether a street gully is part of the road or part of the sewer? Does it not seem almost incredible to the road engineer's mind that a gully should for one moment be held to belong to the sewer when there exist in all parts of the country hundreds of gullies which are not connected with a sewer at all? Would not a discussion on this point, in the columns of THE SURVEYOR, be helpful in ascertaining what are the views of surveyors throughout the country?

* * * *

Are not the series of articles by Mr. G. Bertram [illegible] now appearing in the columns of THE SURVEYOR, of more than passing interest? Does not the recent article on "The Purification of Brewery Wastes" contain information of the greatest value to all who have to study sewage problems, and is it not to be hoped that these articles may eventually be published in pamphlet form so that a "book of reference" on these very important questions may be made available?

* * * *

Is not the Roads Improvement Association to be congratulated on having recently written a letter to the Press calling attention to the exceptional weather and traffic to which the roads of this country have been subjected during the past few months? When we consider that the three great enemies to roads—water, temperature, and extraordinary traffic—have been actively at work, is it to be wondered that the highways have suffered abnormally, and is it not a feather in the cap of many road engineers that greater damage has not been caused? Is it not to be hoped that surveyors will accede to the request of the association and communicate with their secretary, Mr. Wallace E. Riche, as to the result of their experience during these trying times?

* * * *

How many institutions or societies have adopted the excellent suggestion of the president of the Society of Architects that members who are serving their country in the Army should not be called upon to pay their subscriptions while on active service? Is not this one of the numerous ways in which those of us who, from no fault of our own, are unable to fight for our country, could show our appreciation of the unselfish action of the gallant men who are taking their part in this great national crisis?

* * * *

Was the suggestion in the *Journal of the Royal Automobile Club* of the 12th inst. put forward seriously—viz., that pedestrians in country roads at night should wear something white—so as to be seen by motorists and thus avoid the danger of being run down? Not only this, but it was suggested that where the roads were white, they should wear something black, so that, if this extraordinary suggestion is to be carried into effect, will it not be necessary for male pedestrians in future to wear white coats and black trousers, or *vice versâ*? And what about female pedestrians? Can they be easily dictated to as to what they shall wear?

Keighley Tramways.—These lines made a total realised surplus of 2s. 6d. on last year's working, so the chairman of the Tramways Committee stated in a debate upon a proposal to increase the general rates by 9d. in the £.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

459. Sewage Sprinkler. Describe an efficient form of sewage sprinkler for percolating filters which requires very little head of sewage to work it. (J. R. H., *Ipswich.*)

460. Sewage Sea Outfall.—Are reinforced-concrete pipes better than cast-iron pipes for a sewage outlet into the sea, which is covered at high water? Compare them as regards initial expense and maintenance. (J. R. H., *Ipswich.*)

461. Applied Mathematics.—Give some simple examples of the application of the calculus to the solution of practical engineering problems. (Student.)

463. Bomb-proof Dug-out.—Give sketches of a bomb-proof dug-out to hold five people. (Tico.)

464. Masonry Arch.—State three ways in which a masonry arch may fail, and describe the cause of each. (J. F., *Padiham.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

457. Hydraulics.—A common formula for the mean velocity of flow in streams and artificial channels is $v = c\sqrt{m.i}$. Explain carefully the meaning of the various factors on the right-hand side of the expression and state how the values of c for various kinds of channels have been determined.

The formula quoted is Chezy's formula for the mean velocity of flow in channels, &c., and is obtained as follows. If we have a channel of constant size and slope, whose supply does not vary, the flow is said to be uniform, and the height of flow at any two sections is the same. The weight of water passing any section during one second = w.

Ft.-lb. of water per sec. = $w.a.v.h$

where w = weight of cub. ft. of water; a = area of cross section; v = velocity (mean) in ft. per second; h = height through which water falls in length l.

Since, however, the velocity remains uniform, this kinetic energy is spent in overcoming friction with the sides of the channel and in eddies, &c.

Resistance of friction = $F \times p \times l \times v^2$

where F = frictional resistance per cub. in. area of channel; p = wetted perimeter; l = length; v = velocity ft. per second.

$\therefore F.p.l.v^2 = w.a.v.h$

$$F = \frac{w.a.v.h}{p \times l}$$

$\therefore F = w.m.v$

Now $\frac{l}{l}$ = hydraulic radius = m

$\frac{h}{l}$ = inclination = i

There is a connection between F, the friction and v, the velocity, and it is found by experiment that F is approximately proportional to the square of the mean velocity. Therefore, if C is a constant, the mean velocity is

$$v = C\sqrt{m.i}$$

This is the formula put forward by Chezy in 1775 (sometimes r is used instead of m and s instead of i).

To obtain C for any particular case, m, the hydraulic radius, and $i = \frac{h}{l}$ are measured from the sections of the channel considered; v, the mean velocity, is obtained either by means of floats or, if the stream be small, passing it over a weir and measuring the discharge, and obtaining v from the formula

$$v = \frac{q}{a}$$ where q = discharge in cub. ft. per second, a = area of flow.

These values are then put into the equation,

$$\text{and } C = \frac{v}{\sqrt{m.i}}$$

An average value for C for circular conduits is about 125, while for channels filled with weeds, &c., it may drop to 50 or even 30. The way that C increases with the increase of v and a, &c., can be well seen from tables. Some good extracts are given in Merriman's Hydraulics. Among empirical formulæ for determining the value of C, one brought out by Ganguillet and Kutter in 1869, and known as Kutter's formula, might be cited, and is as follows:—

$$c = \frac{\frac{1{\cdot}811}{n} + 41{\cdot}65 + \frac{0{\cdot}00281}{s}}{1 + \frac{n}{\sqrt{r}}\left(41{\cdot}65 + \frac{0{\cdot}00281}{s}\right)}$$ where s = the inclination or slope, r = hydraulic radius.

n is an abstract number whose value depends upon the roughness of the surface. A few values of n are, for brickwork = 0·013, for sewers = 0·015, for average rivers = 0·030. (N. S. J., *Darlington.*)

462. Projectiles.—Establish a formula for determining the angle at which a projectile should be discharged to secure the maximum range. (T. R.)

Let the required angle be a, and the initial velocity u. Then the vertical component is $u \sin a$, and the horizontal component is $u \cos a$.

The vertex A is the highest point of the path, and the tangent at A is horizontal; therefore the projectile is moving horizontally at A.

$\therefore$ the vertical velocity at A is 0

Let t = time required to reach A

Then $0 = u \sin a - gt$

hence $t = \frac{u \sin a}{g}$

The total time of flight, up and down $= \frac{2u \sin a}{g}$

and the constant horizontal velocity $= u \cos a$

The horizontal distance $s = u \cos a \times t$

$$= \frac{u \cos a \times 2u \sin a}{g}$$

$$= \frac{u^2}{g} 2 \cos a \sin a$$

$$\therefore \text{Horizontal range} = \frac{u^2}{g} \sin 2a$$

Obviously the range will be greatest when $\sin 2a$ is greatest, i.e., when $\sin 2a = 1$. The $2a$ will be 90 deg., and a = 45 deg. (J. F., *Padiham.*)

Electric Cookers for Municipal Houses.—Barnes Urban District Council, who owns several workmen's dwellings, and are building others, have decided to instal electric cooking apparatus in each of the dwellings. A type of cooker suited to the needs of the workman's wife has been selected. The oven accommodates a joint weighing 4 lb. or 5 lb., and makes provision for cooking puddings and pastry. Current will be supplied at ¾d. per unit—a very low rate for Greater London. Prepayment meters will be used, the charge being so adjusted as to secure the repayment of the capital expenditure at the rate of about 3s. 6d. per quarter.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible*

INQUIRIES HELD.

Bognor U.D.C. (February 22nd. Mr. Courtenay Clifton).—£1,928 for the erection of workmen's dwellings. There were three schemes involved in the proposal. (1) The erection of groups of semi-detached houses in Upper Lindfield-avenue, costing £1,080; (2) the purchase of additional land in Upper Lindfield-avenue at £128, and (3) the purchase of land at Sheepwash-lane at £720. The surveyor, Mr. Oswald Bridges, stated that the type of house adopted by the council had been built in other parts of the country for £225 each. He did not think he could do it for the same sum, as he was asking for £230. The houses would contain a large living-room, 13 ft. 6in. by 12 ft. 6 in.; a parlour, 12 ft. 6in. by 10 ft.; scullery, pantry, two bedrooms and a bath-room. Each house would have a frontage of 25 ft. There had been an increase in prices since the estimate was prepared, but in chalk concrete and timber, the only materials the cost of labour would increase. He had eighty applications for the cheaper class of cottages and five applicants for the larger type of cottages.

Bridlington T.C. (February 5th. Mr. Edgar Dudley).—£300 for the purchase of land for the purpose of making a street from St. John's-avenue South to Midway-avenue.—It was stated that it was proposed to pay 35 6d per yard for the land. The estimated cost of the street works was £400.

East and West Flegg (Norfolk) R.D.C. (February 17th. Mr. Courtenay Clifton).—£1,700 for the purchase of land and the erection of workmen's dwellings.—The surveyor, Mr. Alfred William Hobbs, stated that he had prepared plans for seven houses. They would each have downstairs a sitting-room, 14 ft. by 11 ft. 6 in., with a height of 8 ft., a kitchen, pantry or larder, wash-house, coal store, and earth-closet. Upstairs they would have three bedrooms, each with separate entrance. The front room would be 14 ft. by 11 ft. 6 in., and the back rooms 9 ft. by 8 ft. Each house would have 7 or 8 rods of land at the back for a garden. Such houses could accommodate a man and his wife and a family up to seven. The land, which comprised 11 acres, was to cost £120.

Penistone U.D.C. (February 5th. Mr. F. O. Stanford).—£1,500 for providing pumping plant at the Ewe-common water station and to meet the cost of laying the mains for the town supply of water.—Mr. C. Champan, engineer, stated that it was proposed to instal a direct-acting borehole steam engine to be driven by a Crossley gas engine. The pump was of 11 in. diameter barrel with 4ft. stroke, the pump to be fixed 15 ft. from the floor to the surface of the foot valve. As to price, the engine would be £432, and fixing £135. The cost of boiler and removal was £200; £150 was put down as the estimate of cost of a house for the engine and he did not altogether approve of the adoption of a corrugated-iron building on account of its short life.

Ramsgate T.C. (February 10th. Mr. Edgar Dudley). £396 for the widening and improvement of Southwood-road. It was stated that the present width of the road varied from 12 ft. 6 in. to 20 ft., and it was proposed to widen the thoroughfare so that at its narrowest it would be 29 ft. 6 in. wide, and at its widest 35 ft. 6 in.

Surbiton U.D.C. (February 17th. Mr. R. G. Hetherington).—£4,900 for the balance of the expenditure on the scheme of sewerage and sewage disposal for the district.—In the course of the proceedings it transpired that the council had paid to the contractors (Messrs. Dick, Kerr & Co.) a bonus of £500 for completing the work five months in advance of the scheduled time, and the inspector pointed out that the Local Government Board auditor had objected to the inclusion of this bonus under the head of capital. Among those present were Messrs. H. T. Mather, surveyor to the council, and A. P. I. Cotterell, M.INST.C.E. (joint engineers for the scheme), and Mr. V. J. Hardwick, architect for the workmen's cottages erected on the work.

APPLICATIONS FOR LOANS.

Bognor U.D.C.—£150 for surface-water drainage.

Buckie T.C.—£1,399 for water supply works, sewerage, and roads.

Coventry T.C.—£3,090 in respect of the second portion of the Leicester-street rehousing scheme.

Farnham R.D.C.—£900 for road widening.

Harrogate T.C.—£1,662 for making up certain streets.

Ipswich T.C.—£5,200 for the purposes of the refuse destructor.

Isle of Ely C.C.—£3,000 for a new school at Whittlesey and £190 for alterations to a school.

Kent C.C.—£3,512 for lithophalt paving works and £1,600 for wood paving at Maidstone.

Ogmore and Garw U.D.C.—£780 for sewerage works.

Sedgley U.D.C.—£3,000 for the purposes of gas lighting.

Southend T.C.—£1,100 for a police station at Leigh.

Stratton and Bude U.D.C.—£1,000 for water main extension.

Tiverton R.D.C.—£450 for works of water supply.

Wigton R.D.C.—£320 for works of water supply.

Wroxham T.C.—£4,000 for the provision of artisans' dwellings.

LOANS SANCTIONED.

Armagh R.D.C.—£11,560 for labourers' cottages.

Battersea B.C.—£31,500 for the electricity undertaking.

Bridlington T.C.—£16,000 for the purchase of the estate of the New Spa and Gardens Company.

Burnley R.D.C.—£380 for works of water supply.

Grays U.D.C.—£896 for public conveniences.

Heckmondwike U.D.C.—£468 for the purchase of land for works of sewage disposal.

Hoylake U.D.C.—£650 for the extension of the parade gardens.

Orsett R.D.C.—£450 for a new road.

Littlehampton U.D.C.—£200 for sewer ventilators.

Skipton U.D.C.—£100 for sewage works extension.

Tamworth T.C.—£1,700 for sanitary improvements.

Tetbury U.D.C.—£825 for boxing a well and test pumping at the waterworks.

FORTHCOMING INQUIRIES.

	MARCH.	£
1	**Edmonton.** For the purposes of public baths and street improvement (Mr. R. H. Beckwith)	2,544
2	**Brierfield.** For the conversion of a bowling green and works of sewage disposal (Mr. A. W. Brightmore)	8,000
2.	**Carlisle.** For works of water supply (Mr. R. G. Hetherington)	59,250
2	**Cheadle.** For the purpose of sewage disposal works (Mr. W. M. Cross)	2,100
2.—	**Mansfield.** For works of sewage disposal (Mr. P. M. Crosthwaite)	2,075
2.—	**Rickmansworth.** For the purposes of street improvements (Mr. Edgar Dudley)	3,000
2	**Rothbury.** For road improvement (Mr. M. K. North)	1,500
2	**Tadcaster.** For the purposes of water supply (Major J. Stewart)	900
3	**Gosforth.** For street lighting purposes (Mr. H. R. Hooper)	737
3.—	**Newcastle-upon-Tyne.** For the provision of public baths (Mr. M. K. North)	29,700
3	**Settle.** For works of water supply (Mr. A. W. Brightmore)	3,100
3.	**Stoke-on-Trent.** For the purposes of sewage disposal and a refuse destructor (Mr. W. M. Cross)	1,540
4.—	**Doncaster.** For the purposes of water supply (Mr. P. M. Crosthwaite)	2,700
4.	**Friern Barnet.** For the provision of an open space (Mr. Edgar Dudley)	6,259
4.—	**Goole.** For the provision of a coal carbonising plant (Mr. H. R. Hooper) ...	13,000
4.—	**Meriden.** For works of sewage disposal (Mr. W. M. Cross)	3,820
4.—	**Southport.** For the purposes of the "Lagoon Site" (Major J. Stewart)	9,000
4.—	**Tingley.** For works of water supply (Mr. M. K. North)	2,000
5.—	**Cockermouth.** For works of sewage disposal (Mr. R. G. Hetherington) ...	800
5.—	**Heywood.** For electricity purposes (Mr. H. R. Hooper) ...	12,460
5.—	**Rotherham.** For the provision of a motor ambulance (Mr. M. K. North)	600
5.—	**Wickersley.** For works of sewerage (Mr. P. M. Crosthwaite)	102

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Louth, Merthyr; housing and town planning—Stourbridge, Wrexham; roads and materials—Exeter, Wilts; sewerage and sewage disposal—Branston, Chipping Norton, Clayton; water, gas and electricity—Rotherham, Stirling, Stratton and Bude. —Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Abingdon T.C.—It is proposed to erect a fire station at an estimated cost of £700.

Coleraine R.D.C.—The council have decided to erect a permanent bridge at Tirkeeran to take the place of the one washed away in the recent floods. The county surveyor estimates the cost of the structure at £600.

Halifax T.C.—The question of the provision of new slaughter-houses is being considered by the town council.

Henley-on-Thames T.C.—It is proposed to purchase baths on the Thames bank, and to adapt them as public baths, at an estimated cost of £1,000.

Kent C.C.—It has been decided to build a new house for the senior medical officer in the grounds of Chartham Asylum, at an estimated cost of £1,500.

Louth C.C.—A scheme has been agreed to for the erection of county offices in Dundalk, at an estimated cost of £6,000.

Merthyr T.C.—A scheme has been approved for extending the town hall and establishing a public library in the vicinity.

Norwich T.C.—Plans have been approved for the conversion of premises in Duke-street into a workshop for the electricity department, at an estimated cost of £200.

Rochford R.D.C.—The council have approved plans for the enlargement of the Sutton Ford isolation hospital, at an estimated cost of £2,000. The hospital is administered jointly by this council and the Shoeburyness Urban District Council.

Southampton T.C.—The borough surveyor, Mr. J. A. Crowther, has completed plans for adapting premises in Romsey-road as wash baths, at an estimated cost of £1,700.

Woking U.D.C.—The council have forwarded to the county council the plans prepared by the surveyor, Mr. G. J. Wooldridge, for the rebuilding of Hermitage Bridge. Mr. Wooldridge estimated the cost of carrying out the work at £2,550, plus any amount which might be payable to landowners affected. The surveyor assumed that the earth necessary for forming the approaches and embankments might be obtained from land in the immediate vicinity, and that no charge would be made for the land over which the new bridge and approach roads would be constructed.

HOUSING AND TOWN PLANNING.

Billinge U.D.C.—The surveyor, Mr. A. Darlington, has received instructions to prepare a scheme for the provision of workmen's houses.

Crick R.D.C.—It is proposed to carry out a housing scheme at an estimated cost of £1,200.

Stourbridge T.C.—A site has been approved for the erection of twenty houses.

Torrington R.D.C.—The council are seeking the sanction of the Local Government Board to a housing scheme.

Wrexham T.C.—It is proposed to erect thirty houses, at a rental of from 5s. 6d. to 5s. 9d. per week, on land belonging to the corporation.

PARKS AND OPEN SPACES.

Kidderminster T.C.—An estimate is to be obtained for laying out three tennis courts in Brinton Park.

St. Helens T.C.—The Parks Committee have received intimation that the Local Government Board have decided that at the present time they cannot properly sanction the borrowing of £2,200 for the laying out of the Hardshaw playing fields on the present site, which they were advised was not a suitable one. The board thought that a small sum expended upon drainage and the provision of gymnastic appliances would be sufficient.

REFUSE COLLECTION AND DISPOSAL.

Ipswich T.C.—The council have accepted the tender of Messrs. E. Catchpole & Sons, Limited, at £1,630, for the enlargement of the refuse destructor, the tender of Messrs. Heenan & Froude at £3,137 for the destructor cells, boiler, and flue connections, and the tender of Messrs. Royce, Limited, Manchester, at £185, for the electric crane to lift the clinker into the wagon on a portable railway placed on the top of the clinker heap.

ROADS AND MATERIALS.

Annfield Plain U.D.C.—Plans have been approved for making up Back Wesley-terrace.

Brentford U.D.C.—An intimation has been received that the Road Board have sanctioned a grant of £6,000 towards the cost of the Ealing-road improvement scheme.

Burnley R.D.C.—A loan of £3,480 is being arranged for the purpose of private street works.

Cardiff T.C.—The Public Works Committee have forwarded to the Monmouthshire County Council a suggestion that a road should be constructed between Cardiff and Newport, and thus avoid the hills.

Clutton R.D.C.—The council are considering a road widening scheme between Hallatrow and Paulton, which is estimated to cost £392.

Coventry T.C.—It has been decided to widen Clarence-street, at an estimated cost of £1,460.

Exeter T.C.—Wood-paving works estimated to cost £13,080 have been approved, as well as granite sett paving, which is estimated to cost £12,933.

Glasgow T.C.—The council last week approved the scheme of a joint committee for an improvement at Glasgow Cross. The approximate price of the properties which it is proposed to purchase in connection with the scheme is £40,000.

Huddersfield T.C.—It has been agreed to carry out an improvement at the junction of New North-road and West-parade, at an estimated cost of £1,575.

Louth T.C.—The tender of Messrs. Ruston & Proctor, at £557, has been accepted for the supply of a steam road roller.

Newport (Mon.) T.C.—The new roadway on the Riverside has been completed, and it was formally taken over by the Works Committee last week, after it had been severely tested by running three steam rollers, first in line and then abreast, along the roadway. The wall is built entirely of ferro-concrete founded on piles, and provides facilities for the local boatmen in the way of steps. The tests were supervised by the borough engineer, Mr. Tremelling, Assoc.M.Inst.C.E.

Stoke Newington B.C.—The council have offered to join the Shoreditch Borough Council in forming a deputation to the London County Council with reference to the widening of Old-street and Kingsland-road.

Wandsworth B.C.—The council have agreed to the construction of junction tramlines from Tooting High-street into Mitcham-road.

Wilts C.C.—The council have agreed to carry out the improvement at May's-corner, Chiseldon, subject to the Road Board contributing £460 towards the cost. —An estimate of £5,000 for tar-spraying has been approved.

SEWERAGE AND SEWAGE DISPOSAL.

Alton U.D.C.—The surveyor, Mr. G. E. Hartley, has received instructions to prepare a further scheme of surface-water drainage.

Branston R.D.C.—It has been agreed to carry out the Boultham sewerage scheme prepared by the sanitary surveyor, Mr. T. R. Howitt. The estimated cost of the work is £3,500.

Bridgwater T.C.—The Local Government Board having refused a loan of £1,100 for a proposed sewerage scheme for the Chilton district because the project "could not be regarded as satisfactory," the council

were appointed a sub-committee to submit further proposals for the work.

Chipping Norton T.C.—The council have taken up a loan of £9,852 for works of sewage disposal, and the matter is to be brought forward for a further loan of £1,657 for a similar purpose.

Clayton (Yorks) U.D.C.—The council have approved the amended estimate of the sewerage scheme submitted by Messrs. G. Wilson & Sons, Manchester. The additional cost, bringing the total to £6,003, is necessitated by the requirements of the Local Government Board.

Ripon T.C.—A letter has been received from Colonel Ellis, representing the War Office at Ripon, informing the council that the War Office had accepted the offer of the corporation to allow them to use land at a small rent at the municipality's sewage disposal works. The extra sewerage would be carried through and the disposal works constructed and worked by the War Office.

WATER, GAS, AND ELECTRICITY.

Abingdon T.C.—Waterworks extensions are to be carried out at an estimated cost of £450, and water mains provided at a cost of £200.

Blackburn T.C.—The question of erecting new electricity works at Whitebirk is under consideration.

Coventry T.C.—The Electric Light Committee have been authorised to grant flat rates to supply light in artisans' dwellings erected by the corporation. The rates were: For a house containing three lamps, 7d. per week; for a house containing four lamps, 9d.; the charges including the provision and maintenance of lamps.

Derby T.C.—The number of customers for electricity, both for lighting and power, continues to increase. The total capital expenditure on this enterprise has reached the sum of £367,210, of which £226,789 has been repaid. The gross profit of £21,895 for the year ended March last showed an improvement. Very large sums are spent annually on renewals, repairs, and maintenance, together with the repayment of stock and mortgages. The profit on the waterworks account increased from £31,206 to £32,758, after the deduction of the Derwent Valley contribution of £25,761, of which £4,691 was charged to the general district rate, and £4,831 to the special water fund account, which shows the substantial reserve of £261,857.

Driffield R.D.C.—Particulars of a proposed water supply for Foston and Middlecave-cum-Wharram have been forwarded to the Local Government Board with a request for a loan to meet the cost of the scheme.

Hull T.C.—The electrical engineer has received instructions to report on the advisability of an electricity scheme for public lighting and domestic cooking.

Llandudno U.D.C.—The council have accepted tenders for a 300 kw. dynamo and 440 b.h.p. engine, with additional induced draught plant, at a total cost of £1,720, for the electricity works.

Rotherham R.D.C.—The council are considering the question of improving the water supply at Beston Levitt and Wickersley by the provision of a reservoir.

Stirling T.C.—The council are considering the question of extending the electricity works.

Stratton and Bude U.D.C.—It has been agreed to lay a new main from Stratton to Bude for conveying water to augment the present supply to the high levels.

Swanage U.D.C.—The question of a new boring for water on land near Woodhouse, Studland, is engaging the attention of the council.

Tenby T.C.—The council have decided to apply for an electric lighting Provisional Order in the present session of Parliament.

Tetbury U.D.C.—Tenders are being invited for sinking a well 400 ft. deep and 14 in. in diameter, and for test pumping at the waterworks, the estimated cost of the works being £825.

Tredegar U.D.C.—The council are negotiating for the purchase of land for the construction of waterworks. About ¾ acre of land is required for the settling tanks and storage accommodation, and the length of the pipe track was given as 3,537 yds.

MISCELLANEOUS.

Bangor (Ireland) U.D.C.—With reference to the application of the council for a loan of £1,180 with which to provide fire extinguishing appliances, and the statement of the Local Government Board in their letter of December 16th, that they were not prepared to sanction so large a sum, but that they would consider an application for sanction to the borrowing of a smaller sum for the provision of a suitable vehicle to carry a fire escape and a number of firemen with hose and tools, the town clerk stated that he had made inquiries and had ascertained that a suitable vehicle to carry firemen and fire escape would cost £500, and at least £100 would be required for housing the apparatus. It was decided to forward an amended application to the Local Government Board for a loan of £600 for this purpose.

Derby T.C.—The corporation tramways have been yielding an increasing return, the nett profit having grown in three years from £5,183 to £8,192. Stock has been paid off in excess of requirements to the extent of as much as £17,318, while the renewals fund account, even if never needed, constitutes a valuable reserve.

PERSONAL.

Mr. Allan W. Ritchie, chief sanitary inspector, Edinburgh, has been elected a member of the Royal Sanitary Institute.

Mr. W. A. Cutting, assistant to the borough surveyor of Hertford, has been appointed assistant surveyor to the Goole Urban District Council.

Mr. E. A. Murphy has been appointed temporary engineer to the Carlow Urban District Council in the absence of Mr. Douglas, who is engaged on military duty.

Mr. A. P. I. Cotterell, M.Inst.C.E., president of the Institute of Sanitary Engineers, on Wednesday gave an address on sanitary service to the members of the Birmingham and Midland Centre of the institute.

Second Lieutenant Alan D. Hetherington, of the 12th Durham Light Infantry, who was for several years in the surveyor's department of the Ealing Town Council, joined his battalion at Sandhurst recently after completing his course of training.

Mr. S. R. Hooper, surveyor to the St. Austell Rural District Council (Eastern Division), has had his salary advanced from £130 to £160 a year to enable him to provide more efficient means of locomotion, it being understood that he should purchase a motor bicycle.

Mr. W. H. Prescott, engineer to the Tottenham Urban District Council, has received the permission of the council to accept a commission in the Royal Engineers, and he has been granted such salary as, with his service allowance, will be equivalent to the civil pay he has been receiving.

Mr. J. Louden, burgh surveyor of Bo'ness, was recently publicly thanked at the town council meeting for his services in respect of an official grant in relief of unemployment. Provost Grant stated that Mr. Louden's work in this instance was on all fours with everything else he took in hand—it was well done.

Mr. W. Olver, surveyor to the Newton Abbot Rural District Council, who is about to take up his new duties as one of the assistant surveyors for Cornwall, took farewell of the members of the rural council recently, and thanked them for the courtesy and kindness they had shown him during nearly sixteen years' service. The chairman, Mr. H. H. Hannaford, J.P., C.C., on behalf of the council, said they wished Mr. Olver every success, and hoped he would do credit to the training he had received at the hands of the Newton Council. He hoped when Mr. Olver got down to Cornwall he would open their eyes, and let them see that all the surveyors did not live in that county. He urged Mr. Olver to try and improve the Cornish authorities a bit, and hoped in years to come he would meet with success. They were all very sorry to lose his services, but very glad that he was improving his position.

In the important case of *Papworth v. Battersea Borough Council*—the judgment in which, delivered last Saturday, is the subject of an editorial in the present issue—evidence for the defendants was given by Mr. T. W. A. Hayward, M.Inst.C.E., F.S.I., the borough engineer, and his two assistants, Mr. Dresden and Mr. White, and was supplemented by the evidence of Mr. H. Percy Boulnois, M.Inst.C.E., Westminster, and Mr. A. E. Collins, M.Inst.C.E., city engineer of Norwich. Mr. Hy. H. Foster, F.S.I., Balham, was one of the witnesses for the plaintiff.

See End of Paper.

BOROUGH OF CHELMSFORD.
BOROUGH ENGINEER'S DEPARTMENT.

Applications are invited for the following appointments (temporary) to replace clerks who have enlisted:—

(a) Clerk: £2 2s. per week.
(b) Stores Clerk: £1 10s. per week.

Previous Municipal experience essential for appointment marked (a).

Applications to be made on Forms obtainable from Mr. Percival T. Harrison, ASSOC.M.INST.C.E., Borough Engineer and Surveyor, Municipal Offices, Chelmsford.

GEORGE MELVIN,
Town Clerk.

Municipal Offices,
Chelmsford.
February 24, 1915. (2,412)

URBAN DISTRICT COUNCIL OF ENFIELD.
TO CONTRACTORS.

The Council invite Tenders for Making Up the following Private Streets in their District—viz.:—

Queen's-road, Enfield.
Stanley-road, Enfield.

Plans and Specifications can be seen, Form of Tender and all information obtained, on application to Mr. Richard Collins, the Council's Surveyor, at these Offices, any day (except Saturday) between the hours of 9 a.m. and 5 p.m.

The Contractor will be required to observe Trade Union hours of labour and to pay wages according to the published scale of the London County Council for the time being in force.

Separate Tenders for each road (on the Form supplied only) to be sent in to me not later than noon on Wednesday, the 10th day of March next, endorsed "Tender for ——."

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
T. W. SCOTT,
Clerk.

Public Offices,
Enfield, Middlesex.
February 25, 1915. (2,416)

TWICKENHAM URBAN DISTRICT COUNCIL.
CONTRACTS.

The above Council hereby invite Tenders for the undermentioned Goods or Materials for a period of one, two, or three years from the 1st April next.—

1. Ballast, Shingle, Flints, Gravel and Sand.
2. Granite Cubes and Setts.
3. Portland Cement.
4. Coal and Coke.
5. Fodder and Forage.
6. Oil and Colourman's Goods.
7. Iron Castings.
8. Street Gullies and Drain Pipes.

Forms of Tender and Specification for the whole of the above may be obtained on application to Mr. Fred. W. Pearce, F.S.I., Surveyor to the Council, Town Hall, Twickenham.

Sealed Tenders, endorsed "Tender for ——," are to be delivered to me, by hand, or by registered post, on or before noon of Thursday, the 11th day of March, 1915.

The Council does not bind itself to accept the lowest or any Tender, and any person whose Tender is accepted may be required to enter into a proper Contract with, if required, two sureties, to be approved by the Council.

The tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligations arising from his Tender, even though he may not have signed a formal Contract.

(By order)
H. JASON SAUNDERS,
Clerk to the Council.

Town Hall,
Twickenham.
February 25, 1915. (2,414)

BOROUGH OF CHELMSFORD.
PUMPING PLANT AT ADMIRAL'S PARK WATERWORKS.

The Town Council of Chelmsford invite Tenders from Engineers for Pumping Machinery, and for the Provision and Erection of a Pumping Installation, complete with all incidental works, at their Admiral's Park Waterworks, situate in the Borough.

Forms of Tender, Plans and Specification may be obtained on application to Mr. Percival T. Harrison, ASSOC.M.INST.C.E., Borough Engineer, Municipal Offices, Chelmsford, on and after 3rd March next, upon depositing the sum of Two Pounds Two Shillings (£2 2s.), which will be refunded upon receipt of a *bonâ-fide* Tender and the return of the document supplied.

Tenders (which must be on the Form provided), enclosed in sealed envelopes, and endorsed "Pumping Plant," must be delivered at my Office by not later than 5 o'clock p.m. on Wednesday, 17th March next.

The Contract will contain a clause providing that the Contractor shall, so far as regards any work executed in the Borough, pay rates of wages not less favourable than those commonly recognised by employers in the Borough for the particular class of work to be performed under the Contract.

The Council do not bind themselves to accept the lowest or any Tender.

GEORGE MELVIN,
Town Clerk.

Municipal Offices,
Chelmsford.
February 26, 1915. (2,415)

GOOLE URBAN DISTRICT COUNCIL.

The Highways and Sewers Committee of the Goole Urban District Council invite Tenders for the Supply and Delivery of the undermentioned Materials for the year ending 31st March, 1916.

1. Broken Granite.
2. Slag.
3. Tarred Slag Macadam.
4. Concrete Flags.
5. York Stone Flags.
6. Kerb.
7. Channel.
8. Stoneware Pipes, &c.
9. Portland Cement.
10. Gravel and Sand.
11. Coal.

Forms of Tender, Specification and any other information required can be obtained on application to Mr. J. H. Castle, Engineer and Surveyor, Council Offices, Goole.

All Tenders, addressed to the Chairman, must be returned not later than noon on Wednesday, the 10th March, 1915.

Tenders not on the authorised Form will not be considered.

The lowest or any Tender will not necessarily be accepted.

ROBERT TYSON,
Clerk to the Council.

Council Offices,
Goole. (2,413)

BOROUGH OF KING'S LYNN.

The Corporation invite Tenders for the Supply of Road Materials for the year ending 31st March 1916.

Full particulars may be obtained on application to the undersigned, to whom sealed Tenders, on Forms and in envelopes supplied, must be delivered, accompanied by Samples, not later than 10 a.m. Saturday, 13th March, 1915.

The Corporation does not bind itself to accept the lowest or any Tender.

ALFRED J. SMITH,
Borough Surveyor.

Town Hall, King's Lynn.
February 26, 1915. (2,411)

THAMES BALLAST.—Plot of land, with small dock on banks of Thames, containing large quantity of first-class Thames Ballast, to be leased on flat rent and with royalty. Property abuts on a main road, and four barges can be loaded at same time direct from the plot. Offers (per cubic yard) and inquiries are invited.—Apply Pegge & Billinge, Solicitors, 12 Booth-street, Manchester. (2,410)

ROTHERHAM BOROUGH SURVEYORSHIP.

MR. SHACKLETON WITHDRAWS.

As reported recently in THE SURVEYOR, the Rotherham Town Council appointed as their borough surveyor Mr. William Shackleton, A.M.INST.C.E., borough surveyor of Nelson, at a salary of £500, rising to £700. Since then Mr. Shackleton has been granted an advance of salary by the Nelson Corporation, and as a result he has decided to retain his position at Nelson. Mr. Shackleton's decision to remain in the borough has given much satisfaction, more particularly as the town council have several important schemes in hand at present.

The vacancy at Rotherham has been filled by the appointment of Mr. T. P. Collinge, ASSOC.M.INST.C.E., borough engineer and surveyor of Mansfield.

EXETER CITY SURVEYOR RESENTS A SLUR.

At a meeting of Exeter City Council on Tuesday the mayor (Mr. J. G. Owen) presiding,

Mr. Percy Gayton, in accordance with notice given, moved that a special committee be appointed to inquire into the question of direct employment of labour by the council, and to report as to the best means to be employed to secure efficiency and economy in all the departments of the council. He said (the *Western Morning News* reports) the council had a right to know whether the complaints made of uneconomical employment of direct labour were due to faults of the workmen or of the officials. Was the council employment merely a convalescent home for workmen, or were the workmen worse or better than those employed outside? If it was not the fault of the workmen, whose conditions of employment were better than those outside, then it was the fault of the arrangements in the surveyor's department. In either case the question should be tackled. Why was direct employment a success in the water and electric light departments and not in the surveyor's department? He asked that the inquiry should be searching, sincere, and impartial.

Mr. J. A. Loram seconded, saying it seemed to him to be an Irish way of doing things to reduce the number of workmen employed, as the recent tendency had been, and at the same time to increase the number of officials.

The city surveyor (Mr. T. Moulding) said the resolution of the council passed six weeks ago would only affect seven workmen. Mr. Gayton had said he estimates had often been exceeded. He challenged him to point them out.

The mayor (interrupting) said if the committee was appointed the surveyor would have an opportunity of being heard.

The city surveyor: But it is a slur upon my character in my profession. I have made estimates amounting to about £26,000 last year, and instead of exceeding the cost they had saved £500 on the estimates.

The motion was put to the vote and lost.

The mayor: That, gentlemen, clears the air.

Housing from the Sanitary Inspector's Standpoint.

This was the title of a short paper read by Mr. H. Dryland, of the sanitary department, Manchester, at last Friday's meeting of the Royal Sanitary Institute in that city. The paper dealt chiefly with the legal powers for closing, demolishing, or improving insanitary houses, obtained under the Housing and Town Planning Act, 1909. In the discussion which followed the reading of the paper, some of the difficulties of dealing with insanitary properties were voiced, and one speaker wished to know how the reader of the paper would deal with an insanitary house under a sanitary workshop. The house under the shop was unfit for habitation, but the workshop above was quite fit for working in. If they got an order to demolish the house they could not carry it out without demolishing the workshop, which they had no right to do. This is not impossible from an engineering or architectural standpoint, but whether the game would be worth the candle is another matter. The opinion was expressed that back-to-back houses could be condemned as unfit for habitation on account of the difficulty of properly ventilating them.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 1.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Minutes of Proceedings.

"Misfeasance" by Road Authorities.

With further reference to the decision in the case of *Warren* v. *Devon County Council and Fothergill Brothers*, briefly commented upon at p. 285 *ante* it will, we think, be of interest to consider the general question of the distinction between nonfeasance and misfeasance in the light of one or two reported cases. The dividing line is, as will be seen, a very narrow one. In the first case we shall notice (*Shoreditch Corporation* v. *Bull*, 68 J. P., 415) the corporation filled the double *rôle* of highway authority and sanitary authority, though apparently this was not material to the decision. After having repaired in a certain road they filled in the trench and opened the road for traffic. About a week afterwards a cab was being driven along the road when the driver, finding the soil where the trench had been filled in to be soft and unsafe, crossed to the offside. Avoiding Scylla he fell into Charybdis—represented by a heap of rubbish—the cab was overturned, and the fare (the plaintiff in the action) sustained serious injuries. The corporation were not responsible for the presence of the rubbish (which had been deposited without their authority), but they knew it was there. The jury found that, at the time of the accident, the part of the road that had been filled in was dangerous for traffic. The case was fought right up to the House of Lords, where it was held that the throwing open of the road when it was not fit for traffic amounted to misfeasance, for which the corporation were liable. It is not such a very "long way" to the next case (*Ryan* v. *Tipperary County Council*, 1912, 2 I.R., 392). This was an instance of a road being under repair, the usual course having been taken of repairing one longitudinal half at a time, leaving the other half open for traffic. The plaintiff, driving along this open half, collided with a large stone lying close to the grass margin, opposite to a steam roller. It was suggested that he had been guilty of "contributory negligence" in not using proper care and caution. But the jury negatived this suggestion, and found that the council were guilty of negligence in not having removed the stone which caused the accident, and the Court held that such negligence amounted in law to misfeasance. In another Irish case (*Breen* v. *Tyrone County Council*, 42 I. L. T. 250) the repairing of the planking of a bridge with a defective board, resulting in injury to a horse, was held to amount to misfeasance. In *Torrance* v. *Ilford Urban District Council* (73 J. P., 225) the council were held guilty of misfeasance in laying a deep layer of broken stone across the whole width of the road for a considerable distance, instead of rolling it as the work proceeded. And in *Meeling* v. *St. Mary Newington Vestry* (10 T. L. R., 54) the filling up of a hole in a road with improper material, apparently, but not really, solid, was considered to amount to misfeasance.

These cases are all connected with the repair of roads. In *Maclennan* v. *Manchester Corporation* (1912, 1 K.B., 118) the facts were of a somewhat different order. Many years ago a road terminating in a ravine was laid out and dedicated to the public. In 1903 the corporation made this road up as a street, and lighted it—after a fashion—but they took no steps to fence off or otherwise to protect the public from the ravine, or to place a watchman or lights near the spot. On the opposite side of the ravine was another street running in the same direction as the street in question, and at night the lights in the two streets, being in line, lured the unwary into the belief that there was one continuous street. The plaintiff, driving at night along the street, was precipitated into the ravine, with serious results. Here also contributory negligence on the plaintiff's part was alleged, but negatived by the jury, who, moreover, found that the street was dangerous; that the unfenced ravine was a trap; and that when the corporation made up the street they took no sufficient care to warn the public of the danger, but invited them to pass along the street as if it was continuous with the street on the opposite side of the ravine. It was held that, although when a road is dedicated as a highway the public take it with all its defects, if the road authority undertake to deal with regard to it and make it up, they must exercise due care and have regard to the safety of those who will use it; that the omission to fence the ravine amounted to misfeasance; and further that, having undertaken to light the street, and having done so negligently and inadequately, they were liable on this ground also. Of course, it is to be borne in mind that

negligence is a necessary ingredient in misfeasance. In the cases noted that element was present. But as an instance of the contrary we may refer to *Holloway* v. *Birmingham Corporation* (69 J.P., 358), which, like the Devon case, was concerned with a tarred road. But in this instance the accusation was that the corporation had allowed the tar to remain without renewal for an unreasonable length of time, as a result of which the road became uneven and dangerous. The actual cause of the accident was a pool of tar which, in consequence of hot weather, had oozed up between the setts, and on which the plaintiff's mare slipped. But there was no evidence that the road had been improperly constructed, and in the absence of any such evidence it was held that there had been no misfeasance on the part of the corporation. The facts in the Devon case were, of course, altogether different, but, as we understand an appeal is possible, we defer any further comment.

* * *

Rural Housing. The difficulty which has always existed of providing cottages in rural districts which can be let at economic rents has been intensified during the last few months. The increase in the rate of interest at which money can be borrowed is in itself a very serious item, but when it is considered in conjunction with the rise in the price of building materials, the production of a self-supporting rural housing scheme will be seen to be virtually impossible at the present moment. These points were emphasised by a deputation from the Rural District Councils Association which recently waited upon the President of the Local Government Board. In the course of his reply, Mr. Samuel dissented from the suggestion that economic building was impossible because of the low wage received by the agricultural labourer, pointing out that there are other classes of people in the village—postmen, policemen, railwaymen, carpenters, blacksmiths and others—who very often will be willing, for a new and comparatively roomy cottage, with perhaps a ¼ acre of land, to pay a very much higher rent than the agricultural labourers, who in their turn can occupy the cottages thus vacated. The deputation asked for a definite pronouncement as to the views of the Local Government Board as to whether, having regard to the present crisis, schemes in hand should be proceeded with or additional schemes prepared as they seem to be required. This request was answered in a letter from the Board which was subsequently addressed to the association, and, as might have been expected, the Board found it impossible to lay down any rules which would be universally applicable. The following principles may, however, be stated in the words of the letter itself:—

> In many cases in which the President considers that a necessity for the erection of new houses for the working classes has been shown to have arisen, he would be content that the actual erection of houses should be postponed if the councils concerned showed their earnest desire to meet the situation when the circumstances became more favourable either as regards the rate of interest or the cost of building, by obtaining approval at once of plans which could and would then be carried out.
>
> In other cases where the need for houses is very acute and particularly where this need is urged as a reason for not taking steps for dealing with existing insanitary houses, the position is somewhat different, as the council concerned cannot be allowed to neglect their statutory duties under the Housing Act in this respect.
>
> Again, as regards the cases in which there have been complaints under sec. 16 of the Housing, Town Planning, &c., Act, 1909, which have been or are found to be justified, the President would feel much difficulty in allowing postponement of action unless the circumstances were very exceptional.

This general statement will at least be useful as a guide to those authorities who are desirous of not shirking their duty on the one hand, nor embarrassing the Government by raising unnecessary loans on the other.

* * *

Rural Cottage Design. It may be within the recollection of our readers that towards the end of 1913 an Advisory Committee was appointed by the President of the Board of Agriculture to consider and advise upon plans, models, specifications, and methods of construction for rural cottages and outbuildings. The report of this committee is now on sale, and will be found to be of the greatest interest and practical usefulness to all who may be interested in rural cottage design. It contains illustrations of twenty-three types of cottages for rural labourers, with notes as to the suitability of each type to particular circumstances of site, aspect, materials, and so on. Four designs are for single cottages (including two bungalows), thirteen are for pairs, and six for blocks of four. The accommodation provided includes a living-room, scullery, larder, and three bedrooms. In two instances (in addition to the bungalows) the third bedroom is on the ground floor, and might be used alternatively as a parlour; while in two other cases a parlour is provided in addition to the accommodation already mentioned. Ten of the designs represent a selection made by the committee from the prize-winning designs in the cottage planning competition organised by *Country Life*. Of the remaining thirteen, the majority were specially prepared for the committee. The text of the report includes chapters —among others—on the requirements of the rural labourer, the design and structure of the cottage, drainage, and water supply. A standard specification is printed in an appendix. The designs from which the illustrations in the report are reduced may also be obtained on a quarter scale on separate sheets, and inasmuch as these represent the best work which has been done in rural cottage design up to the present, they should have a wide circulation and be a source of suggestion to those who are responsible for the actual work of design for any particular case.

* *

An Engineers' Unit. As many of our readers are doubtless aware, the City of London National Guard is rapidly developing under the able direction of the commandant, Colonel G. T. B. Cobbett, V.D., into an exceedingly well-organised force, which will be capable of rendering valuable service whenever called upon by His Majesty's Government to take part in the duty of defending the country, and particularly the City of London, or to undertake duties at present being performed by Regular and Territorial Forces which could be employed more advantageously at the Front. Consisting exclusively of men over forty years of age, and including more than 2,500 members, the National Guard is one among many other noteworthy demonstrations of the patriotic feelings entertained by all classes of the community. With the object of further increasing the scope and practical value of the Guard, it has been decided to form in connection with it a corps of engineers, comprising members of all branches of the engineering profession. We understand that some of the leading engineering institutions have already expressed their readiness to co-operate in the formation of the new corps, which will probably be divided into units, each composed of professional men specially qualified for dealing with classes of work coming under the general heads of

civil, mechanical, electrical, and sanitary engineering.

As it is proposed that all members shall be skilled engineers, the "individual technical training" undergone by ordinary Royal Engineer recruits would obviously be superfluous, and the first duty of the corps will be to become efficient by means of "collective training" in ordinary military routine, so as to make the body capable of working either alone or in conjunction with the main corps in field manœuvres. When efficient in infantry and musketry drill, the various sections of the company will be afforded opportunities of learning and becoming familiar with the manner in which the technical experience of members can be most advantageously utilised in military operations. It is announced that the command of the Engineers' Unit will be taken by Colonel C. E. Cassal, V.D., F.I.C., F.C.S., F.R.SAN.I., late Commanding Officer of the London Brigade Royal Garrison Artillery, Territorial Force, and late Commanding Officer of the 1st London Field Engineers (Vols.). The Engineers' Unit are certainly to be congratulated on the fact that they have been able to secure a commanding officer of exceptional experience. Further particulars and application forms for membership can be obtained from the Adjutant, the City of London National Guard Volunteer Corps, 99 Gresham-street, E.C. We have no doubt that the corps of engineers will appeal strongly to professional men who, although beyond the age for service in His Majesty's Army, are willing to place their technical knowledge and experience at the disposal of the country, and who would naturally prefer to be employed as engineers rather than as riflemen.

* * *

Accurate Estimating.

A deputation from the Institute of Builders, which recently waited upon the council of the Surveyors' Institution, has led to the preparation by the latter body, in consultation with the council of the Society of Architects, of a most useful memorandum on the question of estimating for attendance on sub-contractors. In this memorandum it is pointed out that the practice of quantity surveyors in leaving the cutting away and attendance on sub-contractors to be priced in a lump sum by the principal contractor forms a formidable obstacle to accurate estimating, particularly in the case of large works. The preparation of reliable estimates is of advantage alike to the building owner and contractor, and the suggestions embodied in the memorandum are therefore worthy of very careful consideration. Two main points are dealt with. In the first place greater certainty is aimed at by laying down a definition of the term "attendance," by which it does not comprise any works of construction—*e.g.*, pipe trenches, castings, and so forth—but does comprise all cutting away and making good after, receiving materials and providing storage space for them, providing water, and allowing the use of erected scaffolding and fixed plant. As regards the provision of special scaffolding, where required, there was some difference of opinion, the council of the Surveyors' Institution holding that this does not come within "attendance," but should be the subject of a separate item in the bill. The second point dealt with in the memorandum was that, instead of "attendance" being priced in one lump sum, there should be given as much in detail as possible the extent of the work which it is proposed the sub-contractor shall do, stating precisely what services will have to be rendered to him. Of course, these details would be followed by a general item allowing for any further expense of "attendance" beyond the items priced separately. We imagine that there will be something like general agreement in regard to both these proposals, and all concerned in the preparation of the memorandum are to be congratulated upon a distinct step towards the goal of accurate estimating.

An Important Judgment.

The recent judgment of the House of Lords in the case of *The Worcester Corporation v. The Stourbridge Navigation Company and Gloucester and Birmingham Navigation Company* decided an important question in regard to the liability for the repair of bridges carrying a highway over a canal. The Court of Appeal decided that a local Act of 1791, which provided that all bridges required to carry a highway over the canal in question, now owned by the appellant company, should from time to time be supported, maintained, and kept in sufficient repair by the canal company or their successors, created an obligation to maintain and keep in repair such bridges according to the standard of the traffic requirements of the present day. Against this decision the canal company successfully appealed, and the importance of the case may be judged from the fact that the bridges in dispute will have to be reconstructed if they are to bear modern traffic. The question for decision, therefore, was whether the local Act imposed an obligation to reconstruct the bridges from time to time so as to bear traffic which, though ordinary, is progressively including heavier vehicles. To this question the house replied with a unanimous negative. The Lord Chancellor observed that what the statute required the company to keep in sufficient repair was "such bridges as were approved by the commissioners," and that this did not amount to an obligation to reconstruct so as to provide bridges of a standard higher than that which the commissioners had prescribed. The decision was based upon the express provisions of the statute, and appears to conflict with other similar cases in which it has been said in effect that where undertakers interfere with a highway they have a perpetual liability cast upon them to maintain a bridge or other construction for the purpose of preserving intact the public rights.

Surveyors and Articled Pupils.

In another column will be found some account of a discussion which took place at the last meeting of the Earby (Yorks) Urban District Council upon a recommendation of the Finance Committee that the surveyor should be authorised to take a pupil into his office at a premium to be arranged between himself and the pupil, and to be spread over a period of three years. The discussion arose on a rather curious amendment based upon a contention that equal facility should be given for every parent in the district who had an eligible son for the vacancy. Such a suggestion apparently involves the payment of the premium out of the rates as a sort of scholarship, and the amendment was discussed on these lines. The idea is a novel one, and for our part we are unable to see any valid reason for its adoption. The pupil who is articled to a surveyor in practice is soon able to be of some service to his master, and in fixing the premium and the amount of pocket-money to be allowed some value is placed on this service. In the case, however, of the lad who is articled in a municipal office, this service is rendered for the benefit of the local authority, who in most cases pay nothing for it. The premium is paid for the instruction received from the master, and in our view its amount concerns only the two immediate parties. We can see no reason why it should be paid by the ratepayers or received by the local authority on their behalf.

D

The Treatment of Waste Waters from China-clay Works, Quarries and Coal Washing.—(VI.)

By G. BERTRAM KERSHAW, M.Am.Soc.C.E., M.Inst.C.E., Late Engineer to the Royal Commission on Sewage Disposal.

The working of china clay, or "Kaolin," is confined in this country to the counties of Cornwall and Devonshire, St. Austell, in Cornwall, being the chief centre, and the water of the streams and rivers adjoining the clay works is often milky white from the clay water reaching them.

China clay is used for many purposes other than the making of china—*e.g.*, for weighting cotton goods, mixing with paper-making pulp, &c.

The waste waters from china clay works are not poisonous to cattle, but they are injurious to fish-life by reason of the clogging caused to the gill fringes of the fish; moreover, the suspended matter in the waste waters, apart from the unpleasant appearance which they impart to river water, exercise a silting-up influence, and in times of flood deposits of clay are often washed over pasture land used for cattle.

The clay is usually obtained from pits, by baring down to the clay; when this is reached a sump is formed, and the clay washed into it by jets of water. The coarser material, such as quartz and dirt generally, settles to the bottom of this sump, while the finer clay is pumped up to tanks for settlement. The liquid pumped resembles rather thick milk. After settlement has taken place in the tanks, the clay is removed from the tanks and dried artificially in cubes about 8 in. square, while the supernatant tank liquor is either re-used in the pit or run into the stream, as the case may be.

The waste liquor derived from the process of settlement is usually the colour of milky water, this appearance being entirely due to infinitely small particles of clay held in suspension.

This suspended matter often amounts to upwards of 100 parts per 100,000 in a settled liquor, and it takes a very long time to deposit by unaided settlement, a bottle filled with the liquid remaining milky for weeks, unless salt or acid is added to assist deposition.

As a rule, all that is done to remove the suspended matter is to give simple settlement in rather primitive tanks, formed by embankment in the valleys. These tanks are seldom cleaned out, until they become nearly full of deposited matter, the usual course adopted being to add to the height of the embankments, so as to increase the tank capacity.

It must be borne in mind in considering the pollution—or rather the discoloration and silting-up effect—caused by china-clay waste liquids, that most of the rivers and streams into which the wastes are poured are comparatively short and unimportant, and it is questionable whether any process other than simple settlement could be demanded; and in certain cases, where there are no fishing rights, it seems doubtful whether even settlement need be used. Such a river as the "Red" River has never held fish for generations, and it would appear that purification in such cases would not merely be unnecessary, but an absolute waste of money. As a rule, settlement would be fairly easy for most of the works concerned, and this process could generally be carried out without seriously hurting the industry. If, however, the suspended matter required reducing down to, say, 4 to 5 parts per 100,000, the use of chemicals would be needed, and this would be a most serious matter for the owners and shareholders of the mines.

Regarding the difficulty of settling the very fine suspended matter, the 1868 Commission remark (Fifth Report, Vol. I.): "Of 100 parts of suspended matter contained in the white waste water flowing from a clay pit at St. Austell, 11·56 parts were deposited in the first quarter of an hour, and 47·68 parts in the next six hours, leaving 40·76 parts still in suspension. Here, again, the turbid water had been submitted in various clay pits to prolonged subsidence, and the sample operated upon contained only 47·44 parts of suspended matter in 100,000 parts of water."

Again—"A much less favourable result was obtained in the experimental subsidence of the muddy water discharged from the Gazelan clay works. Although this waste discharge contained as much as 251·6 parts of suspended clay in 100,000 parts of water, it deposited only 2·8 per cent in the first quarter of an hour, and 32·3 per cent in the next six hours, leaving no less than 64·89 per cent still in suspension."

From this it will be seen that to obtain a clear liquid by simple sedimentation is a matter of some considerable difficulty.

QUARRIES.

Refuse waters from quarries are somewhat frequently met with in the Midlands and in the North of England, and what has been already said with regard to the treatment of china-clay water applies equally to waste waters derived from quarries. In the case of quarries, the waste liquids are frequently discharged into fishing rivers or canals, where a large quantity of suspended matter, even though inorganic, would be inadmissible.

As a rule, the smaller-sized stone from quarries is washed after crushing and before grading to size. The washing is often effected in an inclined trough provided with automatic moving spatulas, which work the crushed material up and down in the trough, the washed stone finally falling into a tip-wagon. Water plays on the material as it moves in the trough, washing away the particles of clay, &c., adhering to the stone. In the quartzite quarries in Warwickshire a good deal of red-ochre coloured matter sometimes occurs in the quarries, discolouring the water. Generally speaking, the waste waters from quarries is not very large in volume, and much of the coarser suspended solids can be settled out by careful tank treatment, since most of the particles in the waste water are very much coarser than those derived from china-clay works. Still, even when the coarser matter has been settled out, there still remains much finely divided matter, and this takes some considerable time to settle with unaided subsidence. Quiescent settlement, as would be expected, gives better results—other things being equal—than continuous flow sedimentation.

Stone polishing and sawing yield very similar waste waters to those turned out by quarries. The particles carried off by the water during stone polishing are very fine, since hard stones are operated upon, and it is difficult to settle them in a reasonable time without resorting to the use of chemicals. At the Grinshill quarries, with which the writer was connected many years ago, both red and white freestone was quarried, and most of it was sawn and worked up at the quarries. The saws employed were steel blades set in a frame which moved backwards and forwards over the stone to be cut. The cutting was carried out by means of minute steel shot—about the size of dust shot—which were placed under the steel blades. A small stream of water played above each blade. At these quarries the waste waters, charged with silt, were conveyed to small embanked ponds, and on Monday mornings, before commencing work, the top water was drawn off, and some of the settled silt removed. The silt in the semi-dry state was found to form an excellent polish for iron or brass work. When the ponds became too full of material, this was dug out and disposed of on old spoil heaps. The quantity of water used it may be noted, did not exceed about 1,000 gallons per day.

In the case of deep quarries where the limit of depth has been reached, waste liquors can, of course, be run direct into the quarry, and the water re-used after settlement. There is, however, naturally a limit to this procedure, and in some cases it may be necessary to pump the water and silt to special tanks placed above the quarry.

It should be borne in mind throughout that waste waters from the four industries above mentioned are, in nine cases out of ten, objectionable solely by reason of the suspended matter which they carry, and not by reason of any impurities held in solution.

COAL WASHING.

This process is carried on at practically all collieries, and consists in subjecting the smaller coal to the action of running water, which removes such foreign matters as clay, shale, pyrites, &c. The larger coal

is generally roughly hand picked to remove shale, &c.

The quantity of dirt which the coal contains depends very much upon the thickness of the seams and the absence or presence of clayey matter.

There are a number of special machines on the market designed to wash small coal, such as the Baum, Elliot, Blackett, Greaves, and many others.

In the Greaves washer foreign matter is separated from the coal by a perforated tray moving backwards and forwards under water, the motion given to the tray being much the same as that used in the sifting mechanism of a threshing machine drum part.

In most of the other coal-washers the tray containing the coal is fixed, while the water moves up and down, the fine dirt, which is heavier than the coal, issuing from the bottom of the machine, while the washed coal comes away at the top.

The wash water coming away from the machines is very turbid and black in appearance, and it contains very large quantities of fine coal dust and other substances in suspension—very frequently more than 5,000 parts per 100,000—while the water is very often acid in reaction. A rather large volume of water is used in washing coal, often exceeding 1,000 gallons per ton of coal washed. In many instances, where the wash waters are settled in ponds or tanks, it is re-used over and over again, with benefit both to the streams and to the colliery proprietors.

The continued discharge of crude coal wash waters into rivers and streams of small volume renders the stream water quite unfit for domestic purposes, while it destroys fish and silts up the bed of the stream. Again, as in the case of china-clay wastes, when floods occur silt is often washed over pasture-land to its detriment.

The method of treatment adopted at various collieries throughout the country varies considerably, while in some districts—as, for example, in South Wales—little or nothing is done by way of treatment before the waste waters are discharged. In Lanarkshire, Dr. J. T. Wilson states in a report for the year 1909 that sixty-seven out of seventy-one collieries provided with coal-washing plants use settling ponds, the settled washing waters being re-used in sixty-four cases.

Messrs. Greaves and Holiday, giving evidence before the Royal Commission on Sewage Disposal with reference to coal-washing waters, stated that it could be fairly easily treated either by means of settling tanks or by passing the water through washed coal and mixing the "slimes" with the small coal for coking. Mr. Greaves stated that this was the normal procedure at nearly all the collieries with which he was connected.

At some collieries settling tanks are employed for the recovery of the larger particles of coal, while the tank liquor is pumped into holes excavated in waste shale heaps. In such cases the resulting effluents are often very clear and bright, and they contain practically no matter in suspension.

Frequently, as in the case of the china-clay industry, it is possible to embank areas of flat-lying ground with shale, &c., and to pump the waste waters into the ponds thus formed. In this case the water filters through the embankments, and is then usually fit to be discharged direct into a stream. Most collieries getting up fairly clean coal could settle the wash waters which they discharge so as to come within some 4-5 parts of suspended matter; but in the case of collieries producing dirty coal it seems doubtful whether these figures could be attained without the use of chemicals. Very much depends upon how often the tanks or settling ponds are cleaned out.

Mr. Kershaw's next article will deal with the wastes from lead and tin mines, gut factories and piggeries.

National Guard: Corps of Engineers.—As one of the societies which includes among its members professional engineers, the council of the Royal Sanitary Institute have been asked to call the attention of the members to the Engineers' Company which is being formed in connection with the City of London National Guard Volunteer Corps, raised under the presidency of the Lord Mayor of London. The intention is to enrol in this company those who have had definite engineering training, and who are above the age limit for military service, so as to join a technical branch of the main corps. Full particulars can be obtained from the Secretary of the Corps, 99 Gresham-street, E.C.

SURVEYORS AND ARTICLED PUPILS.

URBAN DISTRICT COUNCILLORS' DISCUSSION.

The Finance Committee of the Batley (Yorks) Urban District Council submitted recently, according to a report in the *Yorkshire Post*, a recommendation that the surveyor, Mr. J. E. Aldersley, should be authorised to take a pupil into his office, the premium to be arranged between himself and the pupil, and such premium to be spread over a period of three years.

Councillor Driver, in moving an amendment that the finance minutes be passed with the exception of the above, said he wished to make it clear that he opposed the motion purely on a matter of principle. He contended that if it was necessary to appoint an articled clerk the appointment should be made on a basis of merit—that was, equal facility should be given for every parent in the district who had an eligible son for the vacancy. In his opinion the action of the council created a precedent, and would lead to difficulties in dealing with such matters in the future. The minute as it stood gave the surveyor power to arrange with any parent of any son with regard to the amount of premium which should be paid. That, in his opinion, should not be. The surveyor was empowered to treat with an individual who had the longest purse. The action took out of the hands of the council the authority which they ought to guard as keenly as they could—that of seeing that all persons should come before the council and be elected to the office to discharge their duties in a proper way. To him it did not look a business-like way of doing things.

Councillor Matthews seconded.

Councillor Duckworth said he did not agree with all Mr. Driver had said, unless he was prepared to pay the ratepayers' money in teaching an articled clerk.

Mr. Driver: I had no intention of spending the ratepayers' money, nor even suggested it. Therefore that remark is out of order.

Mr. Duckworth: There had been a suggestion made that the surveyor be paid out of the ratepayers' money for a pupil.

Mr. Driver: The statement I made was that I was prepared to give the matter consideration as to whether or not there should be an increase in the surveyor's salary. I have not agreed to do anything only from a point of view of consideration.

Councillor Horbury said he could not see what Mr. Driver hoped to obtain by taking the course he had done. The public would understand that they had got to pay or the boy's parents had got to pay. There was no doubt which side they would take.

The chairman said, so far as he was aware, in cases of other authorities who had an articled clerk, that clerk was articled to the surveyor. Either the ratepayers must pay or the boy's parents must pay a premium. Mr. Driver assumed that they would debar some poorer boy from the position, but he (the chairman) thought they should debar anybody being learnt a profession at the expense of the ratepayers.

The amendment was lost.

Society of Architects.—"The Law Relating to the Remuneration of the Architect" is the subject of a paper which Mr. A. Montefiore Brice, barrister-at-law, will read at a meeting of the Society of Architects to be held on the 11th inst. at 28 Bedford-square, W.C. The chair will be taken at 7.30 p.m.

Concrete and Weather.—At a recent meeting of Stonehaven Harbour Trustees a letter was read from the Fishery Board in regard to the concreting of the Old Jetty, the board stating that they were advised that the season was quite unsuitable for the laying of concrete, and that it would be desirable to suspend operations during February and March, and to push on faster with the removal of the copper dam. This being sent to Mr. Barron, Aberdeen, the Harbour Board's engineer, he reminded the trustees that dull, damp weather was the best suited for laying concrete. As the whole season had been, and promised to be, exceptionally open, he saw no reason to suspend the operations, and he pointed out that provision was made in the specification regarding the making of concrete during unsuitable weather. He therefore did not think it was in the interests of the trustees to order the suspension of any part of the works. It was agreed to send the engineer's reply to the Fishery Board.

Bituminous Materials for Road Construction.

STANDARDS FOR THEIR TEST AND USE.

At a recent meeting of the American Society of Civil Engineers the Special Committee on Bituminous Materials for Road Construction, and on Standards for their Test and Use, reported that it had continued its work as such since its report of 1913 until the first part of June, 1914, when the word "Bituminous" was deleted from the title of the committee. The result was to broaden considerably the field of the committee's work. But the committee has become aware of an expectation among many members of the society that something in the nature of a final report on bituminous materials would shortly be presented by this committee, and in the effort to meet this expectation, as well, also, as to release the committee for its work in the broadened field of its action, the attempt is now made to present a comprehensive report, and one as nearly final as may be, under all the circumstances, on "bituminous materials used in road construction, and on standards for their test and use."

The constitution of the committee is as follows: Messrs. W. W. Crosby (chairman), H. K. Bishop, A. W. Dean, N. P. Lewis, C. J. Tilden, G. W. Tillson, and A. H. Blanchard (secretary).

For more than fifty years (the committee observe) the use of bituminous materials of various kinds has prevailed in highway work to a greater or less extent in the United States, and for a longer period in some other countries. Except in the cases of a few materials, this use, until within ten years or less, had been marked by the variety of materials used, the variety of methods of use, the variety of results secured, the lack of standards for materials, methods and results, and the lack of appreciable advance in the science and art underlying the results.

In the exceptions referred to, which are meant to include the sheet asphalt and certain bituminous concrete pavements, it may be said that progress had been steadily, if somewhat slowly, made in the sheet asphalt work, and that the development of the bituminous concrete pavement rapidly advanced the science and art of bituminous pavements generally.

However, even including both these cases, as late as six years ago (1909) standards for materials were lamentably lacking. It was then customary, even where the specifications were otherwise all that could be expected, to describe the bituminous material by its trade name or as "equal to" a particular brand of fairly well-known character. Highway authorities generally knew little or nothing as regards means of identification of bituminous materials—even the asphalts coming under this statement—and no considerable agreement existed among engineers or chemists connected with highway work as to the analyses and tests desirable to be made on either the better-known asphalts or on the newer materials offered for use. A suggestion then made—to the effect that bituminous materials could and should be purchased under specifications which would describe their essential characteristics—met with discouragement and even ridicule from many quarters. . . .

Analyses and Tests of Bituminous Materials.

The adoption of the following lists of tests, as including all those probably of value in determining and recording the characteristics of the bituminous materials used in this connection, is recommended:

TARS.

Specific gravity at 25 deg. Cent. (77 deg. Fahr.).
Flash point.
Solubility in CS_2 (carbon disulphide).
Consistency at 4 deg. Cent. (39 deg. Fahr.), 25 deg. Cent. (77 deg. Fahr.), 46 deg. Cent. (115 deg. Fahr.), 98 deg. Cent. (208 deg. Fahr.).
Melting point.
Loss on evaporation at 163 deg. Cent. (325 deg. Fahr.).
Consistency of residue at 4 deg. Cent. (39 deg. Fahr.), 25 deg. Cent. (77 deg. Fahr.), 46 deg. Cent. (115 deg. Fahr.), 98 deg. Cent. (208 deg. Fahr.).
Melting point of residue.
Distillation.
Consistency of residue at 4 deg. Cent. (39 deg. Fahr.), 25 deg. Cent. (77 deg. Fahr.), 46 deg. Cent. (115 deg. Fahr.), 98 deg. Cent. (208 deg. Fahr.).
Melting point of residue.

ASPHALTIC MATERIALS

Specific gravity at 25 deg. Cent. (77 deg. Fahr.).
Flash point.
Solubility in CS_2 (carbon disulphide).
Solubility of bitumen in CCl_4 (carbon tetrachloride).
Solubility of bitumen in petroleum naphtha.
Character of the residue on glass.
Consistency at 4 deg. Cent. (39 deg. Fahr.), 25 deg. Cent. (77 Fahr.), 46 deg. Cent. (115 deg. Fahr.), 98 deg. Cent. (208 deg. Fahr.).
Melting point.
Ductility at 4 deg. Cent. (39 deg. Fahr.) and 25 deg. Cent. (77 deg. Fahr.).
Fixed carbon content.
Paraffin content.
Loss on evaporation at 163 deg. Cent. (325 deg. Fahr.).
Consistency of residue at 4 deg. Cent. (39 deg. Fahr.), 25 deg. Cent. (77 deg. Fahr.), 46 deg. Cent. (115 deg. Fahr.).
Melting point of residue.
Ductility of residue at 4 deg. Cent. (39 deg. Fahr.). and 25 deg. Cent. (77 deg. Fahr.).

At the present time it may be said that a number of important questions concerning the use of bituminous materials in highway work are desirable of investigation or of solution. Some investigations have been begun, but as yet have not been concluded successfully, mainly because of lack of sufficient time for the proof of certain principles. Other investigations should be begun and pursued under such a variety of conditions as will render the conclusions of general value. As the committee has before stated (in its report dated January, 1912), it believes "that, in order to solve many of the problems of construction and maintenance, it is more necessary to have at hand physical data recorded along uniform lines for a relatively short period than to prove the correctness of certain fine theoretical points," and therefore it again urges resistance to a tendency, apparent in some instances, to ignore the opportunity offered by the committee for collaboration, which would result in mutual benefit, and deprecates any tendency to return to the former chaotic conditions which would ensue from individual, non-concurrent effort.

Of the investigations above mentioned as begun, but as yet unfinished, the following may be mentioned as important and worthy of conclusion:—

(1) The effects of various kinds of earth or soil on bituminous carpets under known conditions of traffic.

(2) The efficiency of the use of asphaltic oils for surface treatments on gravel and broken stone roadways.

(3) The desirable analyses and tests to be made on bituminous materials for known conditions of use.

(4) The standardisation of a determination and expression of the consistency of bituminous materials which preferably may permit of its use on all the wide range of such materials, from liquid to solid, and of the inter-relation existing in certain, if not in all, cases.

(5) The causes of the formation of waves or corrugations in bituminous surfaces and pavements.

(6) The use of a volatile flux instead of the application of heat for the purpose of rendering the bituminous material or cement sufficiently fluid for use under any method.

(7) The maximum quantity of distillate coming over, up to 170 deg. Cent., from tars (as determined by the test proposed by the committee) which may be properly allowed in a material under any known conditions of use and traffic.

(8) The maximum and minimum quantities of free carbon that can be successfully allowed in tars under known conditions of other constituents of the tar, of climate, of traffic, and of methods of use.

(9) The advisability of incorporating in bituminous pavements, built by the penetration method, bituminous material in excess of the minimum quantity necessary for the production of satisfactory results.

(10) The relative efficiency of the various pressures used in the application of various grades and types of bituminous material in the construction of bituminous surfaces and bituminous pavements built by the penetration method.

(11) The variable amounts of the proportions of bitumen in bituminous concrete mixtures, dependent on the kind and character of the component parts of the mineral aggregates.

(12) The allowable maximum penetrations of various types of asphalt cements when such cements are used in bituminous concrete pavements which must be open to traffic shortly after being laid.

(13) The efficiency of bituminous concrete pavements constructed with a number of courses composed of different sizes of broken stone.

(14) The allowable minimum atmospheric temperatures under which it is practicable to secure the desired compression of bituminous concrete mixtures composed of various grades of different types of bituminous cements and different kinds of mineral aggregates.

(15) The use of "seal coats" on bituminous pavements under stated conditions.

Of the investigations before mentioned as important and worthy of commencement and prosecution, the following may be noted:—

(1) The establishment of standards for recording, compiling, and reporting costs of results secured in highway work.

(2) The establishment of standard forms of specifications for the various kinds of bituminous surfaces and pavements ordinarily used, including the bituminous materials therefor.

(3) The devising of standards for recording and compiling traffic censuses, especially to the end that comparisons of traffic can be made readily and with relative accuracy.

(4) The establishment and expression of any relation between the traffic and the life or cost of any bituminous surface or pavement.

COMMITTEE'S CONCLUSIONS.

The committee now submits its conclusions on bituminous materials [with the new or the modified forms of its earlier reported conclusions in brackets], as follows:

General.—The committee deplores the tendency, apparent in some quarters, to devote time and energy for the discovery of "the most satisfactory road surface," and expresses its conviction that there is no such thing as a "panacea" for all highway ills. It believes that, with the development of highway work, it should be constantly more apparent that one of the greatest problems to be solved by highway engineers is the proper selection of the particular material and form of construction to be used, which most efficiently meet the conditions of any particular case, and that progress will be hastened by complete recognition of this fact.

[Most materials and methods of use of bituminous materials have their values, and the real problems are the determination of these values and of their adaptability or fitness to meet the conditions of any case properly.

A bituminous surface or pavement properly designed for carrying light motor vehicles may not be the one best adapted to horse-drawn vehicles, and one which is efficient for light horse-drawn vehicles may be most seriously injured by motor vehicles. A solution of the problem of the proper design and construction of a roadway for mixed traffic is, under any local conditions on which the solution ultimately depends, difficult, though facts are accumulating which may finally permit this solution.

It is still desirable to record the characteristics and details (including cost figures) of use of bituminous materials, and great concordance in so doing is most necessary.]

Census of Traffic.—Your committee desires to emphasise the fact that experience has demonstrated the value of a traffic census taken both preliminary and subsequent to the construction of a highway.

The traffic census should be considered one of the most important variable factors in the solution of that important problem, the selection of that type of construction best suited to local conditions considered from the standpoints of both economy and efficiency. In connection with the census returns on any highway should be considered the traffic on cross and parallel highways, and the effect of improvement of these highways on the traffic of the highway under construction.

It should not be taken for granted that the bald return of a traffic census should be the sole basis of the selection of the type of construction, but it should be considered a guide in determining the value of the type adopted.

Where motor traffic forms a considerable proportion of the total traffic likely to use a highway, the unit width of traffic lines should be considered as 9 ft. or 10 ft., instead of 7 ft. or 8 ft., as heretofore, because of the greater clearance required for the safe passing of the units of such traffic.

[In considering the effect of traffic and its relation to the design and cost of maintenance, it is necessary to take into account the speed as well as the weight of the vehicles.

In view of the recent constant and rapid increase of traffic on the highways, both in number of vehicles and in wheel loads, it will be in the interests of economy for designs of highways to be made with proper consideration of further increases.]

Collection and Standardisation of Cost Data.—In the work of the committee it has become apparent that conclusions may necessitate the use of cost data, recorded along uniform lines. It seems to be urgent that standards for arriving at costs be established and generally adopted as promptly as possible. Your committee therefore recommends to the attention of the profession this important feature of engineering work, with the hope that uniform methods will be generally adopted at an early date for reporting costs of construction and of maintenance.

[The committee believes that, along the lines of standardisation in reporting cost data and for general benefit, it would be advisable for highway departments, in making their regular periodic reports, to adopt a tabular form for presenting their records of the costs of their construction work, which should include data or figures in columns as follows:—

Identification of work.
Description (width, thickness, and material or form of construction).
Length.
Area of bituminous pavement or surface.

Construction expenditures for:
- Preliminary surveys and plans.
- Grading.
- Surfacing.
- Bridges and culverts.
- Under-drains.
- Superintendence and inspection.
- Miscellaneous.

Total of above.
Rights of way and damages.
Total construction and rights of way and damages.
Administration, legal and general engineering expenses.
Total expenditures and overhead expenses.

For the maintenance expenditures there should be a tabular form showing, in columns:—

Identification of work.
Length.
Area.

Maintenance expenditures for:
- Labour.
- Material.
- Hire of teams and equipment.
- Inspection and superintendence.
- Miscellaneous.

Total of above.
Administration, legal and general engineering expenses.
Total cost of maintenance.

Each table, of course, should carry such footnotes or text as might be necessary to supply the further information as to unusual rates of pay or other conditions advisable to be shown.

In compiling costs of any item of work done, the committee believes that it would be advisable and of great public benefit if hereafter all such figures be compiled, whenever practicable, on the following basis:

Total cost to be reported per unit for:
- Cost for materials delivered on site of work.
- Cost for labour and teams placing materials.
- Cost for machinery engaged in placing materials and in finishing the work.
- Cost for inspection and superintendence.
- Cost for general overhead charges.

In footnotes or in the text such statements as may seem desirable in any case should be made concerning rates of pay, conditions and circumstances.]

Construction—General. Your committee is agreed that:

[The use of any form of a bituminous pavement or bituminous surface does not preclude the necessity for the construction of a well-drained, thoroughly compacted, and adequate foundation. In fact, such improvement of the highway frequently attracts heavier traffic, and thus increases the stresses on the subgrade.]

Within certain limits of traffic the proper use of bituminous material should effect economy in the expenditures for the cleaning and maintenance.

[The proper treatment of a broken stone, gravel, shell or slag roadway with bituminous material for the purpose of eliminating the so-called dust nuisance will at the same time render even the best of such roadways more efficient for sustaining traffic, and such treatment with bituminous materials is usually preferable and more economical than sprinkling with water or the use of hygroscopic salts.]

An objectionable slipperiness of bituminous pavements or bituminous surfaces may be decreased or prevented by proper precautions during construction or by proper treatment thereafter.

[The crown generally used in the construction of broken stone roadways is excessive when bituminous materials are used, and a crown of even ¼ in. per foot should be avoided when a lesser crown can be secured without detriment to the surface drainage.]

Construction—Materials. Your committee is agreed that:

For the present, at least, whenever comprehensive specifications are to be prepared so as to admit a variety of types of bituminous materials, separate specifications as may be necessary should be prepared for each type.

Where bituminous pavements are laid, the edges should be protected and a sudden transition from the pavement to any softer shoulder material avoided by means of cement concrete or other edgings, and such reinforcement of the shoulder material as may be necessary.

The character of the stone to be used may influence the choice of the bituminous material.

Whatever method may be used, in any case it is essential, as in water-bound construction, that a suitable quality of road metal be used.

By proper selection and use of the bituminous material, injury to property and deleterious effects upon animal and vegetable life may be avoided, and also considerable hygienic advantage may result from the use of such materials on the highways.

The maximum quantity of distillate up to 170 deg. Cent. allowable in tars depends on the proportions of the other fractions in a tar, and on the conditions of use of the tar, and possibly on the conditions on the road surface after its construction, or on some other facts.

Construction—Methods. [Your committee wishes to emphasise the fact that the selection of the method of construction to be used in a given case will depend on the results of preliminary investigations, and that the recent and imminent development of, and the availability of, mechanical appliances should affect the decision to a great degree.]

Whatever method of construction is selected, the use of a bituminous material by no means justifies any lack of care in the ordinary details to be followed, but rather increases the need for thoroughness and skilled supervision.

The main principles underlying perfection in water-bound roads remain in full force when such roads are treated with bituminous material.

In all uses of bituminous materials in highway work the use of proper machinery is preferable, wherever conditions make such practicable in any part of the process, to the use of hand labour.

The use or omission of a seal coat on bituminous pavements is dependent on one or more of the following points:—

(*a*) The character of the bituminous material used.
(*b*) The method of construction.
(*c*) The density and quality of the work done.
(*d*) The kind and amount of traffic to be expected on the completed highway.

[The length of time that the finished pavement should be closed to traffic varies from a few hours to several days, dependent on the character of the bituminous material used, the method, and on climatic and other local conditions.]

Construction—Mixing Methods. Your committee is agreed that:

[Where the character of the traffic justifies the use of a bituminous concrete pavement, it also demands a correspondingly strong foundation.]

The quantity of bituminous material to be used in any case will depend on the peculiar conditions of that case, such as the kind of road metal and of bituminous material, the character of the aggregate, the climatic conditions, &c.

[The fluidity of the bituminous materials used should be sufficient to ensure a proper coating of the mineral particles, and such fluidity may be obtained by heating, provided the degree of heat is not excessive or sufficient to injure the bituminous materials, and is reached through proper methods.

The bituminous material should possess adhesive and cohesive qualities sufficient to enable it to perform its purposes properly under the conditions of any case, and it should not be of a greasy character.

The adhesiveness, cohesiveness, resiliency, and elasticity of the material should have the greatest possible permanence.

The success of results depends largely on the use of proper sizes of the particles, and on securing a proper density of the mixture for the local conditions.]

The character of the mineral aggregate to be used may be controlled by local conditions, but the best results can only be obtained by the use of the best materials. Excessive sizes, or excessive variations in the size of the mineral particles, should be avoided, and the utmost care must be taken to avoid the segregation of particles of different sizes.

Mixing machines should be used, and hand-mixing methods should be avoided wherever practicable.

The success of results is greatly dependent on the degree of uniformity obtained in spreading the mixture, and on the proper rolling and compacting of the mixture. Too heavy a roller should not be used.

Care should be taken in prescribing or laying any seal coat that invitation or excuse is not given for inferior prior work, and its concealment by such a seal coat.

[The use of fine sand on top of bituminous concrete is open to grave objections, and the use of clean stone chips or small gravel free from particles that will pass through a ten-mesh sieve seems preferable.]

Trap rock in sizes greater than that passing a 2-in. screen should be used with caution in the construction of the upper course unless voids of the same are properly reduced, because of the likelihood of the individual stones to rock under traffic.

In the use of a heated aggregate for the construction of a bituminous concrete pavement, non-uniformity or excess in the heating of stone should be avoided.

Construction—Penetration Method.—Your committee is agreed that:

[An important factor for successful results is the proper compaction by rolling of the road metal before the spreading of the bituminous material.

The use of pressure distributors is to be preferred to hand-pouring applications.

The bituminous material should be sufficiently, but not excessively, fluid when used.

The bituminous material should be sufficiently adhesive and cohesive to carry out the purpose for which it is used, and should not be of a greasy character.

The essential characteristics of a bituminous material—such as adhesiveness, cohesiveness, resiliency and elasticity—should have the greatest possible permanence.

The needed penetration of the material into the rolled stone is had when the bituminous material reaches to the bottom of the average-sized stone in the course penetrated.

With the use of materials susceptible to heat, or fairly so, or otherwise of considerable fluidity during application or for a reasonable period thereafter at normal temperatures, the application of the bituminous material to the rolled stone can well be stopped on a line parallel to and within the edges of the stone, and reliance may be had for this border of the macadam becoming properly bound by the flowing of the bituminous material into it under heat and traffic. With the use of materials having the opposite characteristics, the application of the bituminous materials should be made fully to the edges of the rolled stone.

Present indications are to the effect that the use of bituminous materials in quantities of more than 2½ gallons per square yard, where the upper course of the macadam is to be 3 in. in thickness after compaction, is inadvisable under the penetration method, although sufficient data do not yet seem to be at hand to determine exactly upon the value or possible

advantage of using bituminous material in excess during construction in order to furnish a seal of pores by means of excess, is pledging the life of the surface of the bituminous pavement.

The use of fine sand on top of the bituminous material is open to grave objections, and clean stone chips or small gravel, free from particles that will pass through a ten-mesh sieve, is preferable.]

Constructive Surface Treatments.—Your committee is agreed that:

[The success of surface applications is proportionate to the adhesion obtained by the bituminous material to the old roadway surface, and such degree of cleanliness of the latter must be secured, by means of sweeping or other methods, as will ensure a proper degree of adhesion.

The roadway surface should be dry when the bituminous material is applied.]

Whether or not the application of bituminous material is to be followed by an application of mineral material and the length of time to be allowed to elapse between the application of bituminous material and subsequent application of mineral material, depends on local conditions and on the character and viscosity of the bituminous material used.

[To be successful, a carpet must be able to absorb shocks sufficiently to prevent disintegration by such shocks of the surface to which it is applied.

The bituminous material should be sufficiently, but not excessively, fluid when used.

The bituminous material should be sufficiently adhesive and cohesive to carry out the purpose for which it is used under any conditions, and should not be of a greasy character.

The adhesiveness, cohesiveness, resiliency and elasticity of a bituminous material used for this purpose should be of the greatest possible permanence.

The application of bituminous materials should in all cases be carried well over the outside edges of the rolled metal, and on the shoulder far enough to protect the edges of the metalled surface.

The use of fine sand on top of the bituminous material is open to grave objections, the use of clean stone chips or small gravel, free from particles that will pass through a ten-mesh sieve, being generally preferable.]

Attempts to construct and maintain by bituminous surface treatments a carpet of a greater total thickness than ½ in. have generally been unsuccessful, and in the construction of a successful carpet of a total thickness approximating ½ in., the materials should be applied in layers at intervals rather than by the construction of the total thickness in one application.

The quantity of bituminous material [1] to be used depends on the local conditions in any particular case, but excess in any application is to be avoided, as a deficiency may be corrected by a subsequent application, whereas an excess in any application is difficult, if not impossible, of correction.

The success of results depends first on the condition of the surface to which the treatment is applied. Even the best surface treatment cannot correct defects in the original surface, though it may reduce or modify them.

The application of the bituminous material by means of a pressure distributor is, wherever practicable, preferable to gravity or hand-pouring methods.

[Considerable evidence seems to make undesirable the presence of free carbon beyond a maximum, dependent on the distillate between 170 deg. and 300 deg. Cent., in tars for superficial treatments, in order at least to avoid brittleness at low temperatures.]

The maximum quantity of residue allowable in an asphaltic oil used for superficial treatment should be as great as permitted by the physical conditions of its use, subject to certain limits in the penetration of this residue, and such limits in penetration should be

A minimum which will ensure against undesirable hardness or slipperiness under travel at low temperatures;

A maximum which will ensure against undesirable softness or lack of body at the highest temperatures to be expected after use on the road.

Maintenance and Repairs.—Your committee is agreed that:

Repairs to bituminous pavements and bituminous surfaces should be made so as to secure immediately the greatest possible homogeneity.

It is even more necessary than with many other types of construction to carry out repairs on bituminous pavements and bituminous surfaces immediately the desirability for them appears.

Nomenclature.—Your committee wishes to advise strongly the discontinuance of the use of the terms "tarred macadam" and "asphaltic concrete," as these terms are meaningless in many cases, and unnecessary when proper tests, such as are suggested by your committee, are used.

(To be concluded.)

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Has any concerted opinion yet been arrived at as to whether the work of surface tarring a road is better and more cheaply performed by machine or by hand labour? Have any reliable statistics ever been published showing the alternative cost and ultimate results of these two processes? Would not some authoritative statement on this question be of great value?

* * * * *

Were not the remarks on housing contained in Mr. A. P. I. Cotterell's recent presidential address to the Institute of Sanitary Engineers of extreme interest? Who [illegible] the details in regard to the conditions under which some of our poorer brethren are housed without being deeply impressed? But does not the problem of the remedy resolve itself into the question, Shall local authorities devote a portion of the rates to providing housing accommodation for some of their population who cannot or will not pay the rents [illegible]? And, if so, where is the line to be drawn at which this premiated privilege is to be granted?

* * * *

Is not Mr. Alderman Dixon, vice-chairman of the Cumberland County Council, to be congratulated on his speech at the annual dinner of the Northern Division of the Institution of Municipal Engineers, in which he said that if councils wanted properly trained officials they should pay a reasonable salary? Is it not evident that, so long as local authorities pay inadequate salaries, they run the risk of spending far more of the ratepayers' money as a result of improper design and supervision of their public wants? Is it not often the case with councillors that they are "penny wise and pound foolish"?

* * * *

Is it a fact that the Road Board are refusing grants-in-aid to some highway authorities on the ground that grants in future will only be made where there is labour distress through unemployment? And is it a fact that, so far as can be ascertained, there is not any distress of this kind in any part of the country; but that, on the contrary, it is difficult to find sufficient skilled labour for road work? Is it not also a fact that unskilled labour is worse than useless for modern road construction or maintenance?

* * * *

Are there not objections sometimes raised by drivers of heavily loaded slow traffic that the request to keep to the "near-side" kerb is impossible if there is much camber on the road? Do not these objections take the form of saying that, when once there, it is a strain on the horse to pull the load out again, that there is a danger of things falling off if the load is high, and that, in any case, to be there is a strain on the horse, and that there is also the danger of his slipping sideways? Is there not some truth in these objections?

* * * *

What has been done with regard to the recent order making compulsory the carrying at night of a red rear-light by all vehicles in the metropolitan area? Did not this order come into force on January 1st of this year? And, if so, how many horse-drawn vehicles have obeyed the order? Are the police too busy watching for Zeppelins to observe the scandalous breach of this order, which, owing to the present darkened streets, make vehicular traffic very dangerous?

Manchester Highway Employees and the War.—There are 1,140 persons in the Manchester Corporation Highways Committee's employment, but only 626 come within the prescribed ages for military service. Of this number 274 reservists, Territorials, and volunteers presented themselves for service. All were accepted except fifteen, who did not come up to the required standard, so that 259 have actually joined the colours, making a percentage of 43·77. A few more men in the department have offered themselves for service in the new pioneer or engineering corps which is being formed.

DIRECTION POSTS.

By "Observer."

At various times there have appeared in The Surveyor articles having reference to direction-posts, but dealing with these from a county council or borough standpoint.

Some of the elaborate examples of sign-posts, reflecting mirrors, and semaphore plan signs intended

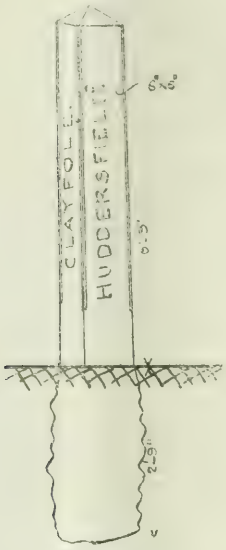

Fig. 1.

for use at road junctions through which a large volume of motor traffic passes (Fig. 2), while within the reach of wealthy corporations, would be out of place in and beyond the means of the majority of rural districts and the smaller urban areas.

In districts somewhat remote from the great hives

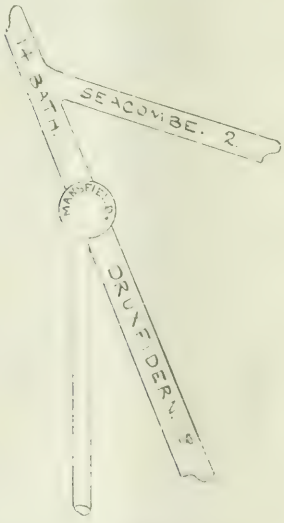

Fig. 2.

of industry, and off the track of the fashionable car-journeying to our seaside and health resorts, a well-made, well-fixed wood wing-post (or cast iron of moderate cost) will suffice, except for dangerous road junctions over which passes a fair amount of light fast traffic.

I am afraid many of the highway surveyors in their daily rounds have not given the subject of sign-posts their attention, and in the accompanying sketches I give examples of design and fixing which betray a lack of sympathy with the altered conditions of traffic and due respect for the rights of the

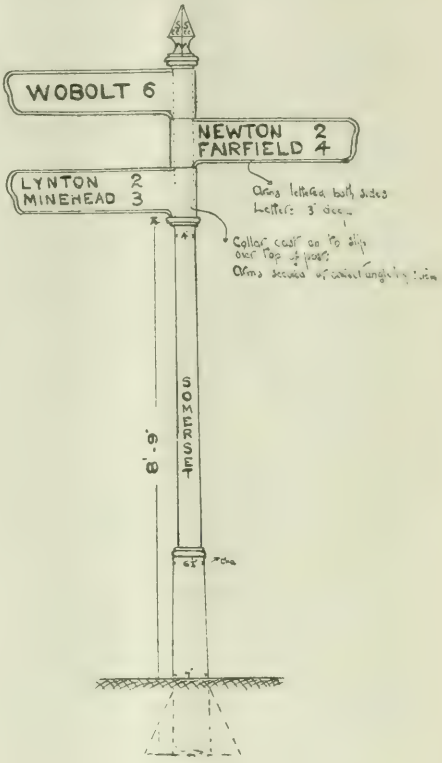

Fig. 3.

travelling public. One sees new posts erected in the same blind corners and constructed in the same old style, without the slightest regard for the elementary rules of cautious driving and the safety of life and limb.

Take, for example, the "straight" post (Fig. 1), common in certain localities, and so fixed as to be

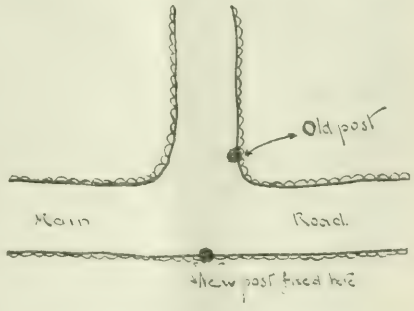

Fig. 4.

visible from one of the junction roads only. And picture a motorist in taking the sharp junction attempting to read the lettering on the post. Sometimes the posts finish with a rounded and sometimes with a pyramid apex, but usually they are cut off square, and have a "ball capping" dowelled on. This capping is often missing, allowing the wet to soak into the pores of the unpainted wood to hasten its destruction. Often hauled from the wood straight to the

...rw-bench, and thence to the painter's shop, its post-...two after a few weeks' ... lonely vigil is not always ...ceed, and the writer has known of cases in sparsely-populated agricultural districts where the county ...oked has played a joke upon the unwary traveller

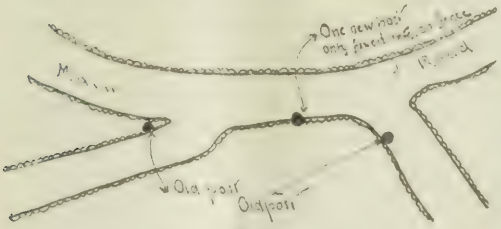

FIG. 5.

...to path, reversing the ... at a four-cross-way, entailing a several-mile longer tramp or drive for the unsuspecting victim. Needless to say, wing-posts, fixed in more advantageous positions, should take their place.

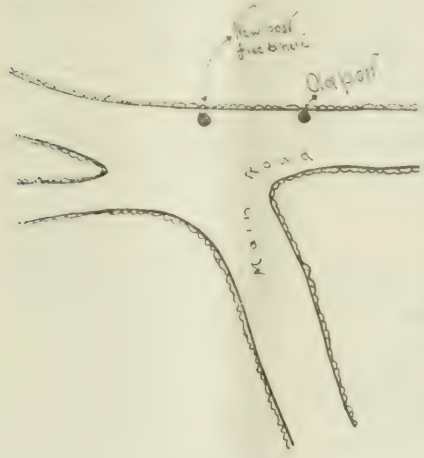

FIG. 6.

Another example is the stumped granite post resting on a never-stumped fence, with a little wood-stump-post fixed fatherly upon its dowelled seat. A third example is the skeleton iron post, ofttimes

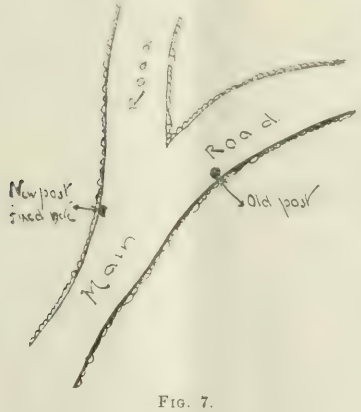

FIG. 7.

hidden from view by the branches of trees and tall bushes, and denied even a single protecting coat of paint.

Where wing-posts are erected the lettering, anything from ¾ in. to 1½ in. in depth—may be laboriously ...pur on by ... instead of being fixed one above the other, are usually fixed in the ... Some authorities paint the post and arms black, with white lettering to remove the gloom. Another fault is the indiscriminate ... within a reasonable radius of the district. The names of small hamlets is of very little use to motorists and travellers, for whose benefit, chiefly, the posts are supposed to be erected.

For the mutual advantage of all the name of the parish may be given on the post itself below the arms, and if the sign is on a county road, the name of the county, or an abbreviation of it, may usefully appear on the top portion of the post above the arms.

A post well adapted for important main roads in rural districts is of the type designed by Mr. H. T. Chapman, formerly county surveyor of Somerset, and now county surveyor of Kent (Fig. 3). For less important roads where the expense of fixing the cast-iron posts would be prohibitive, good, sound-heart oak posts with well-seasoned red deal arms, solidly put together and securely fixed in the most advantageous positions, should take the place of the old-fashioned types referred to. The ratio of cost, approximately, of cast-iron and wood posts is 2½ to 1. The various motor signs might also be more advantageously fixed by being placed at an angle to face the traffic instead of parallel with the road fence—on the "near," and not the "off" side, and about 140 ft. from the place to which they apply, instead of ... on the other extreme ... on.

Sketches 4 to 7 show examples of bad fixing—generally of the type of post described in the beginning of these notes. The sketches also show where, in the writer's opinion, wing-posts should be fixed.

MANCHESTER MAIN DRAINAGE.

AN INSPECTION OF THE WORKS.

... the meeting ... the Royal Sanitary Institute at Manchester on the 19th ult.—reported in our issue of last week—concluded on the following day with an inspection of an interesting section of the city main drainage scheme. The members of the institute were welcomed at the town hall by Alderman Frowde, J.P., chairman of the Rivers Committee. Alderman Frowde was, unfortunately, not in sufficiently good health to accompany the visitors, but his place was ably filled by Mr. Bullough, the resident engineer, whose lucid descriptions made the visit thoroughly instructive and enjoyable.

The work was commenced in April, 1912, and about 18 miles of sewers have been completed, ranging from 15 ft. 3 in. diameter downwards, at a cost approximating £1,000,000.

The work No. 3A, which was first visited, is being carried out by the corporation staff, without the ... diameter, with four courses of Accrington engineering bricks in cement mortar. The sewer is chiefly in open cutting, but a portion of the sewer just about to be constructed will run under the Cheshire Lines railway tunnel.

The work No. 2A, which was next visited, is being carried out by Messrs. E. Nuttall & Co., Manchester, and is also 13 ft. in diameter. This sewer runs under the Bridgwater Canal, being divided into twin sewers at this point, 13 ft. high and 9 ft. 6 in. greatest width. The members were able to go through these sewers, and the dryness of the walls spoke eloquently of the efficient manner in which they were constructed.

Halesworth and Rotherham Town Planning Schemes.—It is understood that the Local Government Board have given authority for the preparation of town planning schemes under the Housing, Town Planning, &c., Act, 1909, by the rural district councils of Halesowen and Rotherham, relating to areas of about 650 and 1,180 acres respectively.

Cottages for Rural Districts.

BOARD OF AGRICULTURE COMMITTEE'S REPORT.

The Board of Agriculture and Fisheries are bringing to the special notice of public bodies, societies and persons interested in rural housing the report of the Advisory Committee appointed by the President of the Board on November 20, 1913, to consider and advise upon plans, models, specifications and methods of construction for rural cottages and outbuildings. The committee consisted of Mr. Christopher Turnor (chairman), Mr. Cecil Harmsworth, M.P., Mr. Raymond Unwin and Mr. Lawrence Weaver. Mr. C. E. Varndell, of the Office of Woods, was appointed subsequently as an additional member.

Pair of Cottages Similar to Design No. 1, Built at Earswick, York.

The report of the committee* contains illustrations of twenty-three types of cottages for rural labourers, with notes as to the suitability of each type to particular circumstances of site, aspect, materials, &c. Four designs are for single cottages (including two bungalows), thirteen are for pairs, and six for blocks of four. The accommodation provided includes a living-room, scullery, larder and three bedrooms. In two instances (in addition to the bungalows) the third bedroom is on the ground floor, and might be used alternatively as a parlour, while in two other cases a parlour is provided in addition to the accommodation already mentioned.

Ten of the designs represent a selection made by the committee from the prize-winning designs in the cottage planning competition organised by *Country Life*. Of the remaining thirteen, the majority were specially prepared for the committee.

The text of the report includes chapters (among others) on the requirements of the rural labourer, the design and structure of the cottage, drainage and water supply. A standard specification is printed in an appendix.

WORKING DRAWINGS AND SPECIFICATION.

The designs from which the illustrations in the report are reduced are published separately on the scale of ¼ in. to the foot. The price of each sheet is 1s. (post free 1s. 1d.), and the drawings may be obtained in the same manner as the report itself.

The specification has also been placed on sale separately at the price of 1d. (post free 1½d.).

Facsimile pages of the report itself containing a list of the plans with dimensions and two plans with descriptions are reproduced herewith.

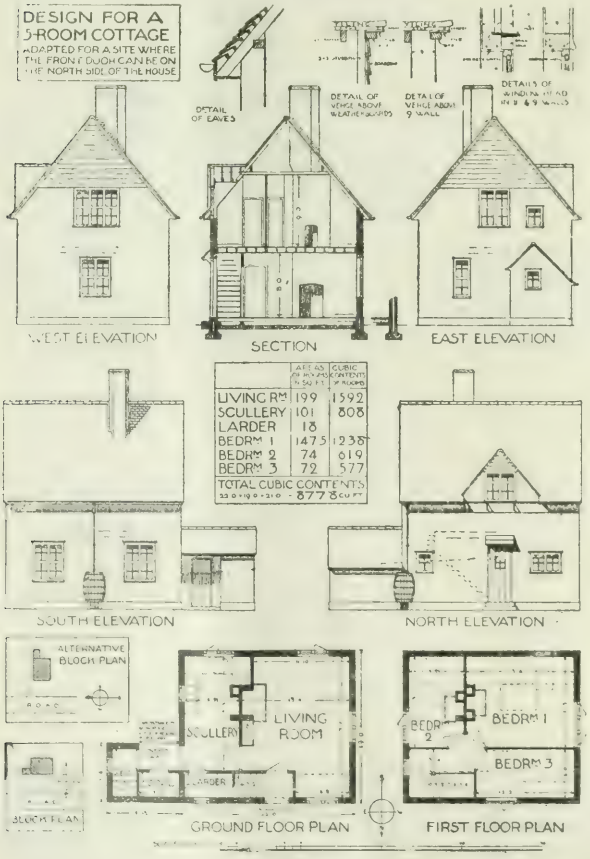
DESIGN NO. 1.

This plan is suitable for a district where brick, brick and roughcast with flat or pan tiles are the prevalent materials. Where weatherboarding would be unsuitable the gables can be tile-hung or built in brick like the remainder of the walls. The design is adapted for sites where the entrance is best placed on the north side of the house, the road being on the north or west as indicated in the alternative block plans. If so placed, the living-room and scullery are both sunny rooms, while the living-room has also an outlook to the road.

The design is made to provide, in the smallest rectangular building, three bedrooms on the first floor, of the minimum size to accommodate, in No. 1, parents and one child; in Nos. 2 and 3, two young children or one adult in each.

It is preferable where possible to have the second bedroom of larger size than provided in this plan.

With this accommodation on the first floor, and the earth-closet and coals in an outbuilding which serves to screen the back door, a good-sized living-room and scullery can be provided on the ground floor, comfortably arranged with



Design No. 1.

*To be purchased, either directly or through any bookseller, from Wyman & Sons, Limited, 29 Breams-buildings, Fetter-lane, E.C., and 28 Abingdon-street, S.W., and 54 St Mary-street, Cardiff; or H.M. Stationery Office (Scottish Branch), 23 Forth-street, Edinburgh; or E. Ponsonby, Limited, 116 Grafton-street, Dublin. Price 2s. 6d. post free 2s. 9d.

the ground is paved, so to leave the greater part of each room undisturbed.

The cottages could be built of cavity construction, a small cavity being provided between the front and back walls, and where the site was suitable.

On sites where drainage is available it is possible to put a combined range and cooker under the room next to the entrance.

DESIGN NO. 8.

This design is suitable for a district where bricks with flat or pan tiles or slates are used, and for positions where the simple lines and sash window treatment would be appropriate.

This plan provides one of the most convenient and economical of cottages, and has been widely used; several of the designs here published will be found to be slight variations upon it.

The design provides a recessed and contemplative living-room, with a serviceable scullery, and on the first floor three bedrooms of sufficient size to accommodate, in No. 1, parents and one child; in No. 2, two grown-up children; and in No. 3, two young children or one adult.

The arrangement of the staircase and bedrooms in this plan economises slightly less space than it does in No. 5, the lighting also has less frontage, and is slightly deeper. Both these points make for economy in cubic contents and in brickwork, the party walls which serve two houses being longer, and the outer walls shorter. The plan, however, requires a site with a aspect nearly due south, as two bedrooms face to the back, and in the centre houses the staircases must be lit and ventilated by small dormer windows high up in the roof, controlled by cords, which are not so convenient as ordinary windows, or so likely to be opened.

The design could be used to different architectural treatment to suit the local circumstances, owing to the fact that only four windows need be used on each floor on the front elevation.

Where a more picturesque treatment would better accord with the surroundings, a useful group may be made by using the two centre houses from design No. 5 and the two end houses from this group. All the staircases could then be lit by windows on an outside wall.

Town Planning Institute.—A paper, entitled "Some of the Larger Problems of Town Planning," will be read by Mr. Thomas H. Mawson, HON. ASSOC. R.I.B.A., at a meeting to be held at 9 Conduit-street, W., on Friday, the 17th inst., at 8 p.m.

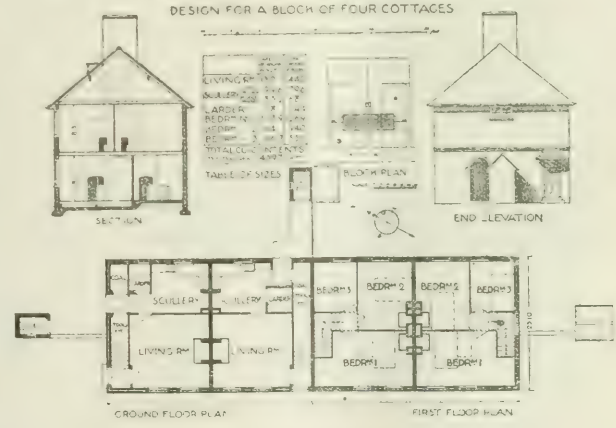
Town Planning at Scotstoun.

The District Committee of the Upper District of Renfrewshire and the Corporation of the City of Glasgow have both asked the Local Government Board for authority to apply a town planning scheme to the area lying between Victoria-drive, Scotstoun, on the east and the boundary of the burgh of Clydebank on the west. The area is about 840 acres in extent. It has a river frontage of 1¾ miles on the south, and is bounded on the north by the county of Dumbarton. The district includes several industrial works.

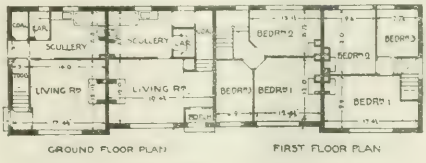
TRADE NOTES.

Sir William Mather, chairman, presided at the annual meeting of Mather & Platt, Limited, on Friday last at the company's works, Manchester. Comparing

the results of [illegible] with 1914 he said that, [illegible] opinion, they were very satisfactory. A divi-



DESIGN NO. 8.



DESIGN NO. 8A.

dend of 10 per cent on the ordinary shares plus a bonus of 2½ per cent, free of income-tax, had been declared. In arriving at their statement of profit during the past year the directors had thought it prudent first to secure the business against unforeseen contingencies that might arise in consequence of the unprecedented situation created by the sudden change from long years of universal peace to that of war on a colossal scale. They therefore decided not to add to the already large reserve fund, but to carry forward a larger sum than ever before—£66,838. Large dividends during war times should not be a primary consideration with company directors and shareholders; they should first try to provide as much work as possible at wages that would enable workmen reasonably to nourish themselves and their families, having due regard to the avoidance of waste and self-indulgence. Business profits earned under those principles might be small, but shareholders ought to bear the sacrifice of part of their dividends as their contribution towards the relief of the universal suffering which the war had caused.

Highways Construction, Limited, Finsbury-court, Finsbury-pavement, E.C., are issuing to their customers a wall calendar of striking design. The firm, as is well known, are the makers of voidless asphalt macadam roads on the single-coat, two-coat and carpet systems, and an illustration of a section of their two-coat work is an interesting feature of the calendar.

Coast Sand Dunes (By Gerald O. Case. St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian*.

Cottages for Rural Districts.

(See Preceding Pages.)

Table showing Cubic Contents and Cost at the rate of one Penny per Cubic Foot of each of the 23 types of Cottages illustrated in Report.

Number and description of design.	Cubic contents of one cottage with outbuildings.	Price at 1d. per cubic foot.*	Remarks.
	Cubic feet.	£ s. d.	
1. Single ...	9,463	39 8 7	Minimum of bedroom accommodation, sufficient for two persons over 10 and five under.
2. Bungalow	10,905	45 7 1	
3. ,,	11,515	47 19 7	
4. Pair	9,416	39 4 8	
5. Block of four.	11,669	48 12 5	
6. ,,	12,086	50 7 11	One of the middle houses has a larger bedroom, extending over archway.
7. ,,	9,655	40 4 7	
8. ,,	11,697	48 14 9	In the middle houses the scullery is somewhat smaller.
9. ,,	9,150	38 2 6	The dimensions of the living-room and scullery vary in the block.
10. ,,	9,552	39 14 2	Third bedroom in attic—maximum of bedroom accommodation sufficient for three persons over 10 and five under.
11. Pair	11,419	47 11 7	
12. ,,	8,486	35 9 8	The third bedroom is on the ground floor and would often be used as a parlour.
13. ,,	8,769	36 10 9	
14. ,,	9,225	38 9 7	
15. ,,	8,757	36 9 9	
16. ,,	8,646	36 0 6	
17. ,,	10,146	42 5 5	
18. ,,	9,984	41 11 11	The second cottage is a little smaller.
19. ,,	8,718	36 6 6	
20. ,,	9,751	40 14 7	
21. ,, ...	10,227	42 12 3	
22. Single	8,370	34 17 11	The third bedroom is on the ground floor and would often be used as a parlour.
23. Pair	7,952	33 2 8	

* A rough estimate of the cost of each cottage, pair of cottages, or block of four can be obtained by multiplying the figure in this column by the local building price per square of roof, and then in the case of pairs or fours by the number of houses. Thus in a district where 4d. per cubic foot is a fair average price for houses in blocks of four the estimate for block No. 10 would be: £39 14s. 2d. × 4 = £159 16s.

† Outbuildings not included.

Obstacles against Accurate Estimating.

Attendance on Sub-Contractors.

The Council of the Surveyors' Institution, in a letter to the council of the Society of Architects covering a memorandum on this subject, stated that a deputation from the Institute of Builders, received by the Quantity Surveyors' Committee of the institution, drew special attention to the obstacle against accurate estimating imposed by the practice of leaving in bills of quantities the cutting away and attendance on sub-contractors to be priced in a lump sum by the principal contractor. In modern buildings the hot-water work, sanitary work, and electric wiring is usually considerable, often, indeed, very extensive, and this class of work, too, is frequently delayed until the building is in an advanced stage necessitating a good deal of work which might be avoided were the requirements known earlier.

Accurate estimating is to the advantage equally of the building owner and of the contractor, and the council of the Surveyors' Institution feel sure that anything which can be done to secure an improvement in that respect will receive the ready support of architects.

The Quantity Surveyors' Committee are satisfied that the builders are not without some ground for complaint, and that the importance of dealing in adequate detail with "attendances" is not fully realised by all who practise as quantity surveyors.

They are of opinion that the matter should be dealt with more precisely than is frequently the case in preparing bills of quantities in order to obviate the friction which often arises between the parties to a contract owing to a misunderstanding as to the liabilities imposed respectively upon the building owner, the general contractor, and the sub-contractor. The following notes and suggestions are therefore recommended for the consideration of members of the institution.

The word "attendance" does not comprise any works of construction—*e.g.*, pipe trenches, castings, &c.—but it does comprise all cutting away and making good after, receiving materials and providing storage space for them, providing water, allowing the use of erected scaffolding and fixed plant. If so provided in the contract it should also be taken to cover the payment of accounts as certified by the architect before their inclusion in the general certificates.

The particular matters dealt with by the builders' deputation were:—

(1) Attendance on heating engineers.
(2) Attendance upon hot-water engineers.
(3) Attendance upon electricians.

In dealing with attendance on these or other special tradesmen, there should be given an account, as detailed, clear and succinct as possible, of the work which it is proposed the sub-contractor shall do, stating precisely what services will have to be rendered to him.

When the sub-contract is of minor importance, all the needs of the case will be met by leaving the estimator, after inspecting the drawings, to assess the value of the work to be done in this connection and set it down against the descriptive item.

When the sub-contract is important, the same account of the work to be done should be given, and, in addition, an indication of the extent of the attendance, stating—

(1) The number of holes for pipes, &c.:
(2) The number of pipe brackets, &c., to be fixed;
(3) The chases for pipes, &c.;
(4) The number of the points for electric lighting, electric bells, radiators, sanitary fittings, &c.

A general item to the following effect should also be inserted:

"In so far as is possible, an indication has been given of the specific attendance required, but the contractor is to allow here for any further expense entailed in waiting upon special tradesmen, or for the disturbance of his work caused by them, and for giving them all facilities for the execution of their work."

Care should be taken that the nature of the attendance which will be afforded them is clearly set out in the sub-contractors' contracts.

It is considered inadvisable in ordinary circumstances to make money provisions to be expended in "day work."

The council of the society, after careful consideration of the memorandum, found themselves able to approve in principle the recommendations of the Sur-

veyors' Institution, but made suggestions for alterations in detail, more particularly in regard to descriptive items, summarised in the cases of sub-contract of minor importance, and set out in full on works of importance.

They also suggested the following additional clause:—

"The words 'attended upon' or 'attendance' do not comprise any works of construction—*e.g.*, pipe trenches, castings, &c.—but they do comprise all cutting away and making good after receiving materials and providing storage space for them, providing water and allowing the use of erected scaffolding and fixed plant. Where the sub-contractor does not allow in his tender for any special scaffolding that may be required in connection with his work, the general contractor must provide it. The words 'attend upon' or 'attendance' must also be taken as so provided in the contract) to cover the payment of accounts as certified by the architect, before their inclusion in the general contractor's certificates."

The council of the Surveyors' Institution agreed that the verbal alteration suggested would be an improvement; but with respect to the provision of special scaffolding, they considered that this could not be taken as included in the general term "attendance," and should be the subject of a separate item.

On further consideration the council of the society agreed to this, and subsequently the council of the Surveyors' Institution, in thanking the council of the society for the interest they had shown in the matter, intimated that their committee would take advantage of the suggestion made by the society when re-issuing the circular on attendances on sub-contractors.

Meanwhile they express a hope that the members of the Society of Architects may support the Quantity Surveyors in carrying out the principles embodied in the memorandum.

London Electricity Supply.—In the current issue of the *Electrician* appears the first instalment of a memorandum by Mr. P. D. Leake, F.C.A., on the financial proposals of the Electricity Committee of the London County Council regarding London electricity supply, which is of special interest now that schemes for the supply of electricity on a huge scale are so much under discussion. The paper clearly sets forth a practical means for keeping a close connection between the existing condition of electrical plant which is so apt to become antiquated and to lose its value before it is worn out—and the provision made out of revenue to answer expired capital outlay. Unless this provision is adequate, the capital value of the undertaking cannot be maintained.

CORRESPONDENCE.

RECENT CIRCUMSTANCES AFFECTING ROADS.

To the Editor of THE SURVEYOR.

SIR,—I have read the letter of the secretary of the Roads Improvement Association with surprise. I had heard of some bituminous roads in various parts of the country which were proving unsatisfactory, but was unaware that there was an all-round failure, and that "these weather conditions have affected nearly everyone alike."

This letter would indicate an underlying opinion that "bituminous" roads are proving unsatisfactory, and as I have taken a prominent part in the study and promotion of this form of construction I make no apology for [illegible] which is backed up by personal experience—*e.g.*, the bituminous or other paving in my district under all kinds of traffic has not, so far as one can see, in any way deteriorated, notwithstanding the weather; and, further, this form of construction has been carried out during the autumn, and is being laid at the present time without any unsatisfactory results.

With reference to failures elsewhere, are some of these not to be anticipated? I have on various occasions pointed out that there is an element of danger in the use of oil residual bitumens, and have also expressed the opinion that [illegible] than a well-prepared tar. Are not the defects frequently blinded by the use of that elusive word "bitumen," which is sometimes termed "pure bitumen" and "asphalt"?

Then there is an important element which is also overlooked—viz., the composition of the aggregate. A [illegible] which will fail if the aggregate has been badly designed; this would be much worse if the "bitumen" lacks proper qualities. In much the same manner, concrete may fail, not necessarily because the cement is inferior, but because the stone, &c., is badly proportioned.

Bituminous road construction must be carefully studied; it is not a simple process, especially in this country with its excessively humid atmosphere in the cold periods of the year, and if the bitumen employed has not the power to resist cumulative hardening, emulsification, or if it contracts too severely under the temperatures prevailing, then failure in some degree must be anticipated.

It will probably be found that where failures have resulted it will have been due to the use of an unsatisfactory "bitumen," careless handling, or indifferent design of the composition, all of which can be controlled, and therefore failures should only in exceptional cases be put down to the weather.—Yours, &c.,

FRANCIS WOOD,
Borough Engineer and Surveyor.

Fulham, S.W.
February 26, 1915.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

EASTERN DISTRICT.

An Eastern District meeting will be held at the offices of the Institution, 92 Victoria-street, Westminster, S.W., on Saturday, 13th March.

4 p.m.—Meeting of Executive Committee.

AGENDA.

(1) To consider annual report.
(2) Suggestions for arrangements of future meetings.

4.30 p.m.—Meeting of the members of the Eastern District.

AGENDA.

(1) Minutes of previous meeting held at Tilbury.
(2) Election of Executive Committee.
(3) Election of Chairman.
(4) Election of district representatives.
(5) Election of honorary secretary.
(6) Suggestions as to arrangements for future meetings.
(7) A discussion on the use of bituminous material in road construction.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, assoc.m.inst.c.e.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for February is awarded to

Mr. F. J. Manning,
Borough Surveyor's Office,
Luton,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

459. Sewage Sprinkler.—Describe an efficient form of sewage sprinkler for percolating filters which requires very little head of sewage to work it. (J. R. H., *Ipswich.*)

460. Sewage Sea Outfall.—Are reinforced-concrete pipes better than cast-iron pipes for a sewage outlet into the sea, which is covered at high water? Compare them as regards initial expense and maintenance. (J. R. H., *Ipswich.*)

463. Bomb-proof Dug-out.—Give sketches of a bomb-proof dug-out to hold five people. (Tico.)

464. Masonry Arch.—State three ways in which a masonry arch may fail, and describe the cause of each. (J. F., *Fadiham.*)

465. Girder Design.—What are the main points to be borne in mind when determining for a given purpose: (*a*) Type of girder; (*b*) proportions of girder (depth and width, &c.); (*c*) material to be employed (steel, wrought iron, or reinforced concrete). (M. T. R., *Ithyl.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

462. Projectiles.—Establish a formula for determining the angle at which a projectile should be discharged to secure the maximum range. (T. R.)

The following more complete reply to this question has been received since our last issue:—

Consider a projectile having an initial velocity V in a direction making an angle α with the horizontal. Let the co-ordinates of any point P on the trajectory be denoted by (x,y) where x is measured horizontally from the initial position, and y is the vertical height of the projectile above the ground.

Neglect air resistance, and resolving V into a vertical velocity of V sin α and a horizontal velocity V cos α. The horizontal velocity is uniform, and the vertical velocity variable owing to the attraction of gravity (g = 32.2 ft./sec.^{2}).

After t seconds the projectile will have travelled a distance $= V t \cos\alpha$ horizontally . . . . . (*a*)
and a distance $= V t \sin\alpha - \frac{1}{2} g t^2$ . . . . . (*b*)
vertically (using formula $s = ut + \frac{1}{2} f t^2$ for a falling body)

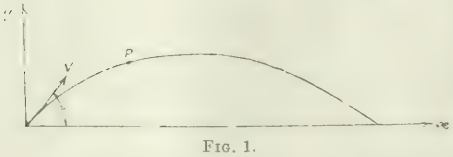

Fig. 1.

The equation of the trajectory is obtained by substituting the value of t from equation (*a*) in equation (*b*).

$$\therefore y = x\left(\tan\alpha - \frac{g x}{2 V^2 \cos^2\alpha}\right) \quad . \quad . \quad . \quad . \quad . \quad (c)$$

which is a parabola.

The range is given by substituting $y = 0$ in (*c*) which gives $x = \frac{2 V^2 \sin\alpha \cos\alpha}{g} = \frac{V^2 \sin 2\alpha}{g}$ for the range.

This is a maximum when $\sin 2\alpha = 1$—*i.e.*, when $\alpha = 45°$.

In the case of the range on an inclined plane, making an angle β with the horizon, we can calculate the position of the point at which the projectile meets the ground. (See figure 2.)

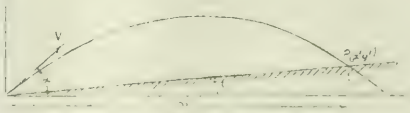

Fig. 2.

The projectile describes the same trajectory, but meets the plane at a point P co-ordinates (x^1, y^1). This position is given by $y^1 = x^1 \tan\beta$, and equation (*c*)

$$y^1 = x^1\left(\tan\alpha - \frac{g x^1}{2 V^2 \cos^2\alpha}\right).$$

$$\therefore x^1 \tan\beta = x^1\left(\tan\alpha - \frac{g x^1}{2 V^2 \cos^2\alpha}\right) \text{ from which } x^1 = \frac{2 V^2 \cos^2\alpha}{g}(\tan\alpha - \tan\beta) = \frac{2 V^2}{g}(\sin\alpha\cos\alpha - \tan\beta\cos^2\alpha)$$

$$= \frac{2 V^2}{g} \frac{\cos\alpha}{\cos\beta} \sin(\alpha - \beta).$$

The range $R = \frac{x^1}{\cos\beta} = \frac{2 V^2}{g} \frac{\cos\alpha}{\cos^2\beta} \sin(\alpha - \beta)$.

For a maximum the differential coefficient of R with respect to α is equated to zero—

i.e., $\frac{d R}{d\alpha} = \frac{2 V^2}{g \cos^2\beta}(\cos\alpha\cos(\alpha-\beta) - \sin(\alpha-\beta)\sin\alpha) = 0$.

$\therefore \cos\alpha\cos(\alpha-\beta) - \sin(\alpha-\beta)\sin\alpha = 0$.

$\therefore \cos(2\alpha-\beta) = 0$.

$\therefore 2\alpha - \beta = \frac{\pi}{2}$ or $\alpha = \frac{1}{2}\left(\frac{\pi}{2} + \beta\right)$.

The angle the projectile makes with the vertical is $\frac{\pi}{2} - \alpha = \frac{1}{2}\left(\frac{\pi}{2} - \beta\right)$.

Therefore for a maximum range on an inclined plane the direction of projectile should bisect the angle between the inclined plane and the vertical. In the above solution the air resistance is neglected. (W. R. H., *Fulham.*)

461. Applied Mathematics.—Give some simple examples of the application of the calculus to the solution of practical engineering problems. (Student.)

Example No. 1.—To find the moment of inertia of a rectangular lamina about an axis (XX) through

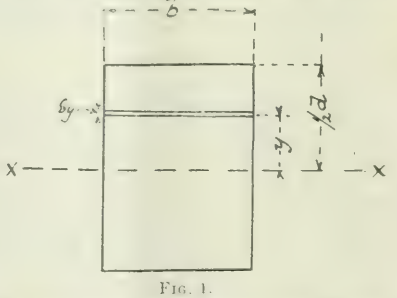

Fig. 4.

the centre of gravity by application of the calculus. Suppose the lamina ABCD in Fig. 4 be divided up

into a large number of very narrow strips of width b and depth dx. Now by a well known theorem the moment of inertia of one of these strips about the axis (XX) in Fig. 2 is

(Moment of inertia about an axis parallel to XX passing through centre of gravity of strip) + (Area of strip × distance from C of neutral axis to the centre of gravity of strip)^2

$$= \frac{b\,dx^3}{12} + b\,dx\,x^2$$

Now, in the above expression the first term is very small when the depths of strips is very large, and when the number of strips is infinite the term $= 0$. So we can write

Moment of inertia of section = sum of moments of inertia of the strips

$$= 2\sum b\,dx\,x^2$$

$$= 2\int_0^{\frac{d}{2}} b\,dx\,x^2$$

But b is constant

$$\therefore \text{Moment of inertia} = 2\int_0^{\frac{d}{2}} b\,dx\,x^2$$

$$= 2b\left[\frac{x^3}{3}\right]$$

$$= 2\times\frac{bd^3}{24}$$

$$= \frac{bd^3}{12}$$

Example No. 1.—Find the economic depth for a rolled steel joist.

Let M = maximum bending moment to be resisted in lb. inches.

d = depth of joist in inches.

F = working stress in tension in lb. per sq. inch.

t = thickness of web in inches.

l = length of joist in inches.

w = weight of steel per cubic inch in lb.

Now,

Weight of 1 flange = $\frac{\text{total stress in flange}}{\text{stress per sq. inch}} \times \text{length} \times \text{weight per cubic inch}$

$$= \frac{M}{\frac{d}{2}F} \times l \times w$$

$$= \frac{2M}{dF} lw$$

Weight of 2 flanges $= \frac{4M}{dF} lw$

Weight of web $= tdlw$

Weight of joist $= \frac{4M}{dF} lw + tdlw$

$$= \left(\frac{4M}{dF} + td\right) lw$$

Differentiate this expression with respect to the depth and we get derivative $= lw\left[t - \frac{2M}{Fd^2}\right]$

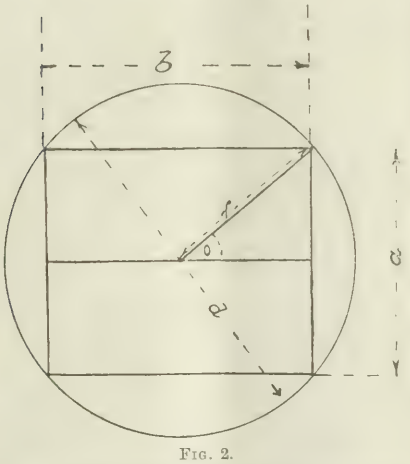

FIG. 2.

For a maximum the derivative must be equated to zero, to obtain the condition

$$\text{i.e., } t = \frac{2M}{Fd^2}$$

$$\text{or } d^2 = \frac{2M}{Ft}$$

$$d = \sqrt{\frac{2M}{Ft}}$$

The [illegible] gives the depth of joist.

Example No. 2.—The strength of a rectangular beam varies as the product of the breadth and the square of the depth; find the breadth and depth of the strongest rectangular beam that can be cut from a cylindrical log whose diameter = d inches.

Refer to Fig. No. 2.

The section of the beam varies as the angle θ varies.

Let r be the radius of the log in section.

Breadth of beam $= 2r\cos\theta$

Depth of beam $= 2r\sin\theta$

Strength of beam is proportional to (breadth) × (depth)^2

$$= 2r\cos\theta \times 4r^2\sin^2\theta$$

$$= S = 8r^3\cos\theta\sin^2\theta$$

We now differentiate and get

$$S = 8r^3\left[\cos\theta\frac{d\sin^2\theta}{d\theta} + \sin^2\theta\frac{d\cos\theta}{d\theta}\right]$$

$$S = 8r^3[2\sin\theta\cos^2\theta - \sin^3\theta]$$

$$S = 8r^3[2\cos^2\theta\sin\theta - \sin^3\theta]$$

For a maximum $S = 0$

$$\therefore 2\cos^2\theta = \sin^2\theta \quad \ldots\ldots\ldots (1)$$

But $\cos\theta = \frac{b}{d}$ $\therefore \cos^2\theta = \frac{b^2}{d^2}$

and $\sin\theta = \frac{h}{d}$ $\therefore \sin^2\theta = \frac{h^2}{d^2}$

From equation (1) $\frac{2b^2}{d^2} = \frac{h^2}{d^2}$

$$\therefore h^2 = 2b^2 \quad \ldots\ldots\ldots (2)$$

But $\left(\frac{d}{2}\right)^2 = \left(\frac{b}{2}\right)^2 + \left(\frac{h}{2}\right)^2$

$$\therefore d^2 = b^2 + h^2$$

By substituting from (2)

$$d^2 = 2b^2 + b^2$$

$$\therefore b = \frac{d}{\sqrt{3}}$$

and $h = \sqrt{\frac{2}{3}}\,d$

So that breadth of strongest beam is $\frac{d}{\sqrt{3}}$

and depth $\quad\ldots\quad\ldots\quad \frac{\sqrt{2}}{\sqrt{3}}\,d$

(M. T. R., *Khyber*.)

INSTITUTION OF MUNICIPAL ENGINEERS.

COUNCIL MEETING.

At a meeting of the council held in London on February 26th the following applicants were recommended for admission:

To Membership: Mr. E. J. Miles, deputy borough engineer, W. Hartlepool.

To Associate-membership: Messrs. K. G. Foster, chief assistant, Chelmsford Rural District Council, and A. Skinner, chief assistant, Beverley Borough Council.

Elected to Studentship: Mr. I. C. Jenkins, surveyor's office, Abersychan Urban District Council.

Mutual Aid Fund.—The council had under consideration the application from a certain member, but were of the opinion that the case was not one for the fund. At the same time, after a lengthy discussion of the matter, they tendered the member in question certain advice.

Arrears.—The secretary was instructed to furnish the various district secretaries with a detailed statement of arrears due from members in their district.

Council Meetings.—Mr. Horace Boot gave notice that at the next meeting of the council he would move that the London council meetings be held on the last Wednesday in each month instead of the last Friday, and that the time of the meeting be 5.30.

The next meeting of the council will be held in London on Friday, March 26th.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bedwas and Machen U.D.C. (February 26th. Mr. H. Shelford Badwell). £2,150 for works of water supply in the Machen Ward.—It is proposed to construct water mains from Trethomas to Machen, the council having secured a three years' agreement with the Rhymney and Aber Gas and Water Company for a supply of water in bulk. The minimum quantity of water to be supplied is 10,000 gallons per day, and the maximum is not to exceed 40,000 gallons per day.

Coleraine U.D.C. (February 25th. Mr. P. C. Cowan). £1,000 for the construction of a covered concrete tank in connection with the waterworks reservoir at Ballyversal.—The surveyor, Mr. W. J. Given, said he estimated the cost of the proposed tank at £911. The tank would have a capacity of 180,000 gallons. Messrs. Swiney & Croasdaile, engineers, Belfast, recommended this tank or an alternative scheme at £4,000. The inspector said that in Newtownards they had been troubled with impure water through storage in the open, and after the construction of a covered tank the trouble disappeared. The council, he noticed, was in a very happy position financially. They paid strict attention to domestic scavenging—a very important work. He was sure this would tend to a reduction in disease.

Killarney U.D.C. (February 22nd. Mr. A. W. Price).—£1,500 for the purchase of materials for road improvement, and £370 for the purchase of materials for sewerage works.—It was stated that the cost of the labour would be met by a grant from the National Relief Fund.

Lisburn U.D.C. (March 1st. Mr. P. C. Cowan). —This was an inquiry into the application for a Provisional Order enabling the council to acquire, otherwise than by agreement, certain lands for the purpose of extending the water supply of the urban district. At the same time the council applied for sanction to the borrowing of £6,000. Evidence in support of the proposed extension of the water supply was given by Mr. Norman McLean and Mr. J. E. Croasdaile, of Messrs. Swiney & Croasdaile, consulting engineers.

Mansfield T.C. (March 2nd. Mr. P. M. Crosthwaite). —£1,300 and £975 for works of sewerage in Chesterfield-road, and sewerage and sewage disposal at Pleasley Hill.—On Chesterfield-road the existing sewer was laid thirty years ago, and as it has become insufficient, it is proposed to lay a new 36-in. sewer 450 yds. in length. The extension will drain an area of 200 acres. Regarding the Pleasley Hill loan, the works were originally constructed fifteen or sixteen years ago, and, owing to the growth of the population, they have now become inadequate, and an extension is necessary.

Paignton U.D.C. (February 27th. Mr. W. O. E. Meade-King).—£920 for the widening of Preston Sands-lane.—The surveyor, Mr. C. Owen Baines, said it was proposed to set back a corner 26 ft. and make the general width 60 ft. wide.

Prudhoe U.D.C. (February 23rd. Mr. C. H. Eyles). £6,000 for the purchase of land and the erection of workmen's houses.—The site consists of 8 acres at Edgewell, where the council propose to build thirty houses, of which plans were submitted.

St. Germans R.D.C. (February 26th. Mr. W. O. E. Meade-King). £900 for sewerage and sewage disposal works for the parish of Crafthole.—The clerk, Mr. F. E. Cleverton, said it was proposed to conduct the sewage in 7-in. stoneware socket pipes, cement jointed, to a point below the reservoir of the Torpoint Urban District Council. Here the sewage was to be treated by triple contact, two sets of beds being provided. The outfall was to be to an existing sewer or drain which emptied into a natural stream not far above its junction with the salt water of the estuary. The existing sewer or drain at present conveyed the drainage of a farm. The sanitary inspector, Mr. P. B. Govett, said a few of the houses in the village were without drainage. Mr. R. H. Worth is engineer of the scheme.

APPLICATIONS FOR LOANS.

Bexley U.D.C. £800 for the extension of the recreation ground.

Chertsey R.D.C.—£1,782 for additions to the sewage pumping plant.

Croydon T.C. £4,000 for road widenings.

Godstone R.D.C. £3,500 for new council offices.

Hendon U.D.C. £591 for the construction of roads.

Linthwaite U.D.C. £1,900 for the Hoyclouse improvement scheme.

Llandudno U.D.C.—£1,720 for electrical plant.

Meriden R.D.C. £3,820 for sewerage and sewage disposal works at Fillongley.

Newton Abbot R.D.C. £900 for the purchase of land for a housing scheme.

Southgate U.D.C.—£11,795 for laying wood paving and bituminised granite.

Stoke-on-Trent T.C.—£1,499 for road widening.

LOANS SANCTIONED.

Devonport T.C.—£10,240 for a new school.

Finchley U.D.C.—£2,500 for a disinfectant station, £300 for a cottage, £610 for air compressing plant, and £760 for humus tanks.

Godstone R.D.C.—£455 for the purchase of land at Warlingham for sewage disposal.

Hendon U.D.C.—£9,986 for sewerage works in Dollis Valley.

Lancaster T.C.—£1,000 for the enlargement of the isolation hospital.

Llandudno U.D.C.—£1,225 for laying out public golf links.

Rochdale T.C.—£5,570 for sewerage works.

Southgate U.D.C.—£1,400 for Broomfield Park improvements.

Surrey C.C.—£1,397 for the extension of Epsom technical school.

Wednesbury T.C.—£2,146 for a new electricity transformer station and plant.

Withernsea U.D.C.—£7,500 for the South Cliff sea-wall scheme.

FORTHCOMING INQUIRIES.

Approved Sanatoria.—The Local Government Board have issued a revised list of sanatoria approved by them under the National Insurance Act, 1911, for England and Wales, and copies of the list (price 1d.) have been forwarded to interested authorities.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below:—Buildings, Essex Godstone, housing and town planning, Dublin, Newcastle-on-Tyne, Swansea; roads and materials, Harrow; sewerage and sewage disposal, Chipping Norton, Lambeth, Stafford; water, gas and electricity—Cleckheaton, Dover, Hull.—Particulars of other projected works will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Blackpool T.C.—The Health and Cleansing Committee have adopted the recommendation of the borough surveyor, Mr. J. S. Brocklebank, for a consumptive sanatorium at Staining, and these will be forwarded to the Local Government Board in due course for approval.

Chesterfield T.C.—The Board of Education have approved the plans of the Education Committee for the erection of a school in Saltergate.

Claypole R.D.C.—The surveyor, Mr. P. A. Watford, has received instructions to prepare plans for an isolation hospital.

Colne T.C.—Repairs are to be carried out at the municipal hall and public library, and the borough surveyor, Mr. T. H. Hartley, has been instructed to prepare plans for an additional exit to the municipal hall.

Coventry T.C.—The city council recently passed a vote of £400 for the provision of stained glass in certain windows of the council house in course of erection. Mr. W. H. Grant, who submitted the proposition, stated that the proposed windows were part of a scheme of heraldic decoration, and in this connection he quoted a saying of Ruskin's: "Better the rudest work that tells a story or records a fact than the richest without meaning. There should not be a single ornament put upon great civic buildings without some intellectual intention." He said the original scheme was to show in stone something of the growth, development and history of the city—a story that in legend and written records went back 1,000 years. The figures to be carved for the outside of the new municipal buildings formed a procession of kings and queens, priests and prelates, knights and earls, benefactors, and other citizens. The general scheme of heraldry for the exterior embraced thirty-six shields or blazons. In the two windows proposed for approval the Weavers' and Skinners' Companies were to be celebrated, and he believed if the scheme were carried out Coventry would have one of the finest examples in Great Britain of civic buildings expressing in blazons the story of its growth.

Essex C.C.—Revised plans have been prepared for the extension of the council school at Dunmow, the cost of which is estimated at £2,396.

Godstone R.D.C.—The plans of Mr. Streatfield for the proposed new offices have been approved by the council. The estimated cost of the building, including furniture and fittings, is £2,900.

Hendon R.D.C.—It has been decided to erect an additional ward at the isolation hospital, at an estimated cost of £200.

Hythe T.C.—It has been agreed to construct four additional groynes at an estimated cost of £1,580.

Maidstone T.C.—Negotiations have been completed for the purchase of a site for a small-pox hospital.

Manchester T.C.—The council on Wednesday decided not to proceed with the building of four public washhouses (at a cost of £16,000) and twenty-one tennis courts at various public parks (at a cost of £2,050). With respect to these projects Alderman Copeland, chairman of the Finance Committee, stated that the Treasury will not at present sanction the raising of fresh capital for new expenditure.

Middlesex C.C.—At the next meeting the council will reconsider their decision to postpone the erection of the proposed sanatorium for the treatment of tuberculosis, the Local Government Board having submitted to them reasons why, in the board's opinion, delay is undesirable.

Newbury T.C.—An estimate has been approved, at £350, for a manual instruction annexe at the council school.

Twickenham U.D.C.—The surveyor, Mr. F. W. Pearce, has been asked to prepare plans for the provision of additional accommodation at the isolation hospital at Whitton, and to obtain estimates for permanent and, alternatively, temporary buildings. The latter arose out of a suggestion by a medical member who contemplated the burning down of the buildings after twenty years' use, as by that time they became saturated with microbes.

Wandsworth B.C.—The council have adopted a recommendation of the Highways Committee asking the county council to construct a tramway shelter with lavatory accommodation at the triangular portion of Clapham Common, at the junction of The Avenue with South Side. Permanent refuges are to be placed in Tooting Bec-road and Trinity-road at their junction with Balham High-road.

HOUSING AND TOWN PLANNING.

Balbriggan U.D.C.—The Local Government Board have approved the council's scheme for the erection of thirty workmen's cottages, at an estimated cost of £7,000.

Carlisle T.C.—A scheme has been approved by the Health Committee for the erection of thirty-six houses—twenty-four upon one site and twelve upon another.

Dublin T.C.—It was decided on Monday to carry out a housing scheme on the McCaffrey estate, at an estimated cost of £36,030. The houses will be let at 7s. a week.

Glyncorrwg U.D.C.—The surveyor, Mr. W. P. Jones, has been instructed to prepare plans for two housing schemes.

Kirkcaldy T.C.—The burgh surveyor and sanitary inspector have prepared a report on their visits of inspection to various places where housing schemes are in operation.

Mutford and Lothingland R.D.C.—The Assistant secretary of the Local Government Board has written informing the council that it was a matter for the Local Government Board to decide whether any charge in connection with houses to be built in the district should be a charge on the district or parish, and stating that any application for a declaration under sec. 39 (1) of the Act of 1909 should be accompanied by a full statement of the grounds on which the application is made, and by full particulars of the housing scheme proposed to be carried out, and, further, that the board would only consider such an application in connection with a definite scheme.

Newcastle-on-Tyne T.C.—At an estimated cost of £117,781, the Housing Committee have agreed to proceed with the scheme for erecting 688 houses on a site in the vicinity of Walker Park.

Swansea T.C.—In consequence of the prices for building being in excess of the council's estimates it has been resolved to allot a contract for the erection of 150 houses of the 500 houses it is proposed to build, with a condition that the basis of prices might be reconsidered under more favourable financial circumstances.

REFUSE COLLECTION AND DISPOSAL.

Rochdale T.C.—A scheme has been approved by the Cleansing Committee for adapting the tramway depot in Entwistle-road for cleansing purposes, at an estimated cost of £700.

ROADS AND MATERIALS.

Axbridge R.D.C.—The council have agreed to carry out a scheme of the surveyor, Mr. J. Lovell, for working the quarry at Crosse. The proposal is to lay a tramway and haul the trucks by means of a wire rope, the weight of the loaded trucks to pull up the empty ones. The estimated cost of the scheme is £225, and it was stated that it will result in a saving of £100 a year.—A grant of £388 has been sanctioned by the Road Board in aid of the East Brent-road improvement scheme, and the council will borrow £1,000 to meet the rest of the cost.

Axholme R.D.C.—The surveyor, Mr. B. West, has received instructions to prepare a statement with a view to application being made to the Road Board, through the county council, for a substantial grant

towards the cost of adapting to the new traffic the road selected for the route to Keadby Bridge.

Barnstaple R.D.C.—The council have referred to the General Purposes Committee a letter received from the Bridges and Main Roads Committee of Devon County Council, expressing the opinion that with 118 miles of main roads and 426 miles of district roads to look after, it was impossible for the district surveyor (Mr. A. A. Richards) to supervise the work properly. They considered the district should therefore be divided into two, and two surveyors appointed.

Chelmsford T.C.—New road works are to be carried out at an estimated cost of £1,489.

Cheltenham R.D.C.—The council have approved a proposition of the surveyor, Mr. C. Beynon, with respect to the purchase of local stone. The present method of purchase is by the load, in which there is no sufficient uniformity of weight, and Mr. Beynon suggested that in future the stone should be yarded and measured, which would entail a cost of about £10 per annum, but would ensure that the council got the quantity of stone paid for, and would be more satisfactory to all parties. It was resolved to insert in all contracts a clause that the contractor is to stack such stone at 2d. per yard.

Cuckfield R.D.C.—The highway surveyor, Mr. A. Macarthur, reported that the London Granite Company could not accede to the council's proposals for the substitution of Groby (Leicester) granite for the balance of Quenast granite due on the current year's contract, and in consequence he had placed orders for equal quantities in the hands of the Groby Granite Company and the Mountsorrel Granite Company for the supply of the 700 tons due at prices as quoted in tenders for the ensuing season's supplies of materials.

Hampton Wick U.D.C.—The surveyor, Mr. P. Taylor, was on Monday authorised to purchase 3,000 gallons of special tar from Messrs. E. Catchpole & Sons, at 4d. per gallon, for the main roads, and 150 yds. of shingle from the Ham River Grit Company, at 6s. 6d. per yard, for the other roads.

Hornsey T.C.—The borough surveyor, Mr. E. J. Lovegrove, recently called attention to the necessity for repairing considerable lengths of footways, and the Finance Committee were requested to provide "as large an amount as possible" to meet the cost of the work.

Leyburn R.D.C.—The Highways Committee have been asked to consider the questions of employing a permanent staff on the roads, and the purchase of a steam roller.

Macclesfield T.C.—A portion of Barracks-lane is to be made up according to plans prepared by the borough surveyor, Mr. S. C. Baggott.

Walsall T.C.—The borough surveyor, Mr. John Taylor, in his annual report, states that there have been thirteen workmen in his department who have joined the military forces, and twelve horses and eight vehicles have been impressed into the service. It is becoming increasingly difficult, he states, to keep the roads in an efficient state of repair, not only as a result of increased traffic, but owing to the motors, which caused exceptional wear and tear. Moreover, the Road Board had discontinued all grants since the outbreak of war.

Wilton T.C.—The council have forwarded the plans of the borough surveyor, Mr. G. Cole, for a series of street improvements estimated to cost £5,171, with a request for a grant in aid of the works.

Woolwich B.C.—In July last the London County Council decided to undertake the widening of High-street, Eltham, and Eltham-road, at an estimated nett cost of £53,000. The execution of the scheme necessitates the acquisition of certain strips of land forming part of the Crown estates. The Crown authorities desire that the land not taken for the purpose of the improvement should be properly fenced off, and, in connection therewith, they are willing to surrender sufficient land to make a footpath on the south side of Eltham-road for the length in question, of a uniform width of 12 ft. This addition to the public way, in the opinion of the council, is very desirable, and steps have been taken to amend the scheme accordingly.

SEWERAGE AND SEWAGE DISPOSAL.

Bexhill T.C. Application has been made to the Board of Trade for permission to lay a 15-in. surface-water drain and storm-water relief sewer, extending about 210 ft. below high-water mark, under and on the foreshore opposite Cooden Sea-road, Bexhill.

Billericay R.D.C.—The council have instructed Messrs. Willcox & Raikes to prepare plans for sewerage extensions.

Chertsey R.D.C.—The council have agreed to the proposals of the surveyor, Mr. H. Beeney, for additions to the plant at the sewage pumping station. These include the provision of a new 20-h.p. gas engine, air compressor, gas generating plant, and the removal of one of the existing centrifugal plants to new buildings. The estimated cost is £1,782.

Chipping Norton R.D.C.—A sewage disposal scheme for Charlbury is under consideration. The estimated cost is £4,000.

East Barnet U.D.C.—A letter has been received from the Lee Conservancy Board stating that they had had before them a report by their chemist upon his analysis of a sample of the effluent from the sewage farm to Pymmes Brook from which it appeared that the effluent was in an unsatisfactory condition, and requesting that immediate steps should be taken to remedy the state of affairs. The report of the council's chemist upon a sample taken at the same time, which stated that the effluent was an excellent one, was read. In the circumstances the council have asked the conservancy board to state in what respects the sample is considered by their chemist to be unsatisfactory.—The surveyor, Mr. H. York, has received instructions to prepare an estimate for a small humus tank and an additional settling tank.

Lambeth B.C.—It is proposed to reconstruct the sewer from Water-lane to the borough boundary, Brixton-hill, at an estimated cost of £14,450.

St. Austell R.D.C.—The surveyor, Mr. W. H. Moffatt, has received instructions to prepare a drainage scheme for Sandy Bottoms, part of Bethel, and Grampound.

Stafford T.C.—The Public Health Committee have submitted to the council a proposal for an improved system of sewage disposal, the cost of which is estimated at £19,000.

Stockton R.D.C.—The plans of the sanitary surveyor, Mr. W. J. Rodham, for a sewerage scheme for Wolviston have been approved.

Southwick (Sussex) U.D.C.—A favourable report was submitted on Monday as to the benefit derived from the new surface-water drain, which was meeting every contingency. Mr. Flinn said he thought the surveyor, Mr. G. W. Warr, and the council were to be congratulated on the success of the scheme, especially after the criticism which had been experienced.

Swanage U.D.C.—The surveyor, Mr. W. H. Pearce, has reported to the Works Committee that he had met Mr. Commin, the sanitary engineer for the military camps, who had informed him that it was proposed to connect to the Ulwell sewer by a 6-in. pipe, following, approximately, the line of the Ulwell stream. The surveyor requested him to submit an alternative estimate showing the increased cost of putting in a 9-in. pipe in Ulwell-road. With regard to Godlingston camps, Mr. Commin said he was endeavouring to get the War Office to sanction a sand filter scheme as distinct from draining into Victoria-avenue.

Wirral R.D.C.—The council have accepted the tender of Mr. Charles L. Warren, at £1,900, for the Willaston and Eastham drainage scheme.

Worcester T.C. The council on Tuesday considered the sewage-filtration difficulty. While the sewage can come under treatment satisfactorily the filter beds have become sealed, and to this question of filtration considerable attention has of late been given, expert advice sought, and visits paid to other works, including those at Coleshill and the main works at Saltley. At each of these a deputation paid special attention to the treatment of sludge. A visit was also paid to Salford. Last month the Local Government Board sent a letter to the council, and this was considered by the Sewerage Committee, who recommended that the board be informed that the council had abandoned the idea of dealing with the sewage by means of upward filtration, that a copy of a report by the city engineer, Mr. T. Cainik, be forwarded to the board, and they be told the committee were asking the council to make a trial of steps recommended by the city engineer for washing the surface of the filters so as to facilitate their working. This recommendation the council approved, the estimated cost being £200.

Wortley R.D.C.—The council recently decided to proceed at once with a scheme for the drainage of Charlton Brook, Chapeltown. The project had been debated by the council for nearly ten years. The Local Government Board is to be asked to sanction a loan of £1,500 for the purpose, and a loan to cover the repayment of £700 wayleaves, and the capital cost of improving and extending the Chapeltown sewage works.

WATER, GAS, AND ELECTRICITY.

Belleek (Ireland) R.D.C.—An intimation has been received from the Local Government Board that, as no objections had been received, they proposed to issue an order investing the council with the powers of an urban sanitary authority for the purpose of carrying out the scheme of lighting by electricity.

Cleckheaton U.D.C.—A scheme is proposed for the extension of the electricity undertaking, at an estimated cost of £20,000.

Dover T.C.—The Electricity Committee have adopted a scheme for new electricity plant at an estimated cost of £6,000.

Evesham R.D.C.—The council on Monday accepted a tender, at £1,949, for carrying out the Harvington water scheme. This does not include the work in connection with the crossing of the river. The engineer's estimate for the work, including the river crossing, was £2,195, and the loan was for £2,500, including easements.

Halifax T.C.—The Electricity Committee propose to spend £5,000 upon new electricity mains.

Hull T.C.—The Electricity Committee have approved a scheme of plant extension, which will cost £41,500. The chairman, Alderman Hanger, stated that the cost of the extensions would not fall upon the rates.

Ripon T.C.—Colonel Ellis, representing the War Office at Ripon, has written stating that the maximum quantity of water to be taken from the Lumley Moor and Roundhill reservoirs for the military camp would be 300,000 gallons per twenty-four hours. He agreed on behalf of the War Office to the increased estimate of £2,238 as stated by Mr. Dixon, the engineer, for alterations at Lumley Moor, and to an annual charge of £100 for labour. He also agreed that the supply of water for the camp should not prejudice the corporation's supply of water for the city in regard to pressure or quality.

MISCELLANEOUS.

Hampton Wick U.D.C.—Of two tenders, that of Mr. J. Downs, a local contractor, has been accepted for a year at 9s. per day for general cartage, 2s. 6d. per yard for drawing from the wharf, and £180 for the removal of house refuse.

Limerick C.C.—At a meeting of the council on Saturday it was unanimously decided that the surveyors should each be advanced a loan of £100 to buy motor cars, and allowed 5d. a mile allowance for the running of the vehicles.

PRO PATRIA.

[TWENTY-FIRST LIST.]

We present herewith the twenty-first list of municipal engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Alderson, F., assistant surveyor to the Romford Rural District Council, Royal Engineers.

Cheaseman, F. C., borough engineer's office, Southwark, 16th (County of London) Battalion, Queen's Westminster Rifles.

Collins, W. R., engineering assistant, Enfield Urban District Council, Lieutenant, City of London Regiment, Royal Fusiliers.

Dent, G. E., clerk, Darlington borough engineer's department, bombardier, Royal Field Artillery, No. 1 Depot, Newcastle-on-Tyne.

Maynard, C. E., second assistant, surveyor's department, Romford Rural District Council, Second Lieutenant, Oxford and Bucks Light Infantry.

Page, J., junior assistant, surveyor's department, Romford Rural District Council, bombardier, Reserve (Active Service) Battery, Royal Field Artillery.

PERSONAL.

Mr. M. H. Sykes, borough engineer of Stockton-on-Tees, died, we regret to state, last week.

Mr. E. R. Ennals, surveyor to the Hartismere Rural District Council, has received an increase of salary.

Mr. W. H. Eley, surveyor to the Newmarket Urban District Council, has been voted an increase of salary.

Mr. S. Sladden, surveyor to the Bridge (Kent) Rural District Council, is recovering from an attack of congestion of the lungs.

Mr. P. B. Grinham, highways surveyor to the Alresford Rural District Council, has had his salary raised from £160 to £180 a year.

Mr. Robert Forbes, water engineer and assistant burgh surveyor of Buckie, has been appointed sanitary inspector to the Cumnock Town Council.

Mr. H. Anderson, Mr. W. J. Isaacs, Mr. W. Walker and Mr. J. H. Rickman, members of the drawing-office staff of the York Corporation, have each received increases of salary.

Mr. W. H. Hall, ASSOC.M.INST.C.E., assistant in the borough engineer's office, Southwark, has been appointed temporary assistant engineer under the Port of London Authority.

Mr. E. B. B. Newton, borough engineer of Paddington, will, on Thursday evening, the 18th inst., address the members of the Municipal and County Club on "The Use, Abuse, and Misuse of Roads."

Corporal A. B. Lowrie, an assistant on the secretarial staff of the Roads Improvement Association, who enlisted in the Army Service Corps at the end of October, has now been recommended for promotion to staff-sergeant.

Mr. John K. Bowen has been appointed county surveyor to the Waterford County Council. Mr. Bowen is the son of Mr. Patrick Bowen, J.P., Monkstown, and has been engineering inspector for the Congested Districts Board at Claremorris.

Mr. J. F. Hawkins, county surveyor of Berkshire, had the honour of being received by His Majesty the King at Buckingham Palace on Tuesday last, to submit the design of the new Albert Bridge between Old Windsor and Datchet. The design submitted was that prepared by the county surveyors of Berks and Bucks, to be carried out on the system of the Trussed Concrete Steel Company, Limited. His Majesty expressed his approval of the design. Mr. Hawkins also submitted to His Majesty the design of the new bridge over the Thames between Goring and Streatley, of which he is engineer.

Mr. Thomas P. Collinge, borough engineer and surveyor of Mansfield, who was recently appointed borough engineer, surveyor and waterworks engineer of Rotherham, in succession to Mr. E. B. Martin, has been directly connected with municipal work for upwards of twenty years, having held responsible positions at Carlisle, Nelson, and other places. He was deputy city engineer and surveyor of Carlisle from 1904 to 1908. He is an associate-member of the Institution of Civil Engineers, and a member of the Institution of Municipal and County Engineers. His salary at Rotherham will commence at £500, rising by £50 per annum.

At the meeting of the Institution of Civil Engineers on Tuesday, February 23rd, the members received an intimation that His Majesty the King of the Belgians and Admiral Lord Fisher of Kilverstone, First Sea Lord of the Admiralty, had consented to accept election as honorary members of the institution. The election was effected forthwith by acclamation, and the addition of these illustrious names to the small group of distinguished men who form the institution's roll of honorary members is a source of much satisfaction to the members.

Proposed Arterial Roads.—Suggested arterial roads in Greater London were discussed at a recent meeting of the Middlesex County Council upon a motion of the Highways Committee viewing with favour the principle of two arterial roads—one from Denham, Bucks, through Middlesex to the Colchester road; the other from Chertsey, Surrey, joining the other arterial road at Redhill, Edgware road, and continuing there to join the St. Albans road and the Great North road at Hadley High Stone.

HILL'S MOTOR ACUUM ROAD CLEANSER.

DEMONSTRATION AT HUDDERSFIELD.

On Thursday of last week a demonstration of the working of Hill's patent motor vacuum road cleanser was given in Huddersfield for the benefit of the Huddersfield Corporation, the demonstration also being attended in force by a large number of representatives of neighbouring municipalities, including Birkenhead, Bradford, Dewsbury, Leeds, Oldham, Royton, Sheffield and Wakefield.

The machine was first introduced into this country from Italy, and demonstrations were given in various parts of the kingdom. The world's patent rights were then purchased by Hill's Patent Motor Vacuum Road Cleanser, Limited, and that company at once set out to alter the machine in conformity with the requirements and demands of British cleansing authorities. The Huddersfield demonstration was the first that has been given publicly with the machine in its present form, and it was immediately apparent that very great improvements had been effected.

Three machines were on exhibition, one being at the fire station for inspection purposes, while the other two were used for the demonstrations given morning and afternoon over routes specially selected by Mr. K. F. Campbell, M.INST.C.E., the borough engineer of Huddersfield, for their diversity of pavement and conditions, embracing, as they did, granite-sett, local stone paving, wood block paving, tar asphalt and macadam-roemac.

A specially prepared track of ashes had been prepared owing to the fact that a keen frost during the previous day and night had made this necessary in order that the capabilities of the cleanser might be displayed to the full. A bright sun coming out brought about a state of conditions that could not prevail in the ordinary way—that is to say, the machine was asked to sweep both wet and dry material at one and the same time; but the machines responded excellently, as was clearly evinced from the favourable criticisms heard on all hands.

The machine in its original form has been described in these columns on a previous occasion, but the improvements are so marked as to require further comment. The machine, as now constituted, consists of four main components—viz., (1) a complete 45-h.p. motor chassis, specially designed for constant running at slow speeds; (2) a cylindrical brush and shield; (3) a large receiver placed behind the sweeping cylinder for collecting the sweepings; (4) a water tank of 100 gallons capacity, together with pump and jets for spraying atomised water to the road surface in front of the brush, thus ensuring dustless and hygienic sweeping.

A very marked improvement is in the increased width of track swept, this being now 7 ft. as against 4 ft. 6 in. formerly, while the brush now extends beyond the rear wheels, and it is thus possible to sweep the channels equally with the rest of the roadway. The capacity of the receiver has also been increased to 75 cub. ft., and it will now hold approximately 3 tons of sweepings.

The water tank and jets are a great improvement, as they not only prevent all possibility of dust rising during the sweeping operations, but they also tend to settle all light dust in the receiver. The water is forced through the jets by a centrifugal pump, and is sprayed on to the road in atomised form, a great economy in water consumption being thereby effected. A soluble disinfectant is added to the water; thus, not only the refuse collected, but the road itself is disinfected, and this still further adds to the hygienic advantages claimed for the Hill machine.

FOR OTHER ADVERTISEMENTS
See End of Paper.

THE Acton Urban District Council requires a Temporary Clerk in the Surveyor's Office. Only persons with considerable experience need apply. Salary £3 3s. per week. Applications, with particulars of experience, and testimonials, to be forwarded at once to F. Sadler, Surveyor, Council Offices, Acton, W.
March 1, 1915. (2,442)

WANTED, an experienced Foreman for Road Work, including Tar-spraying with Llewellins & James' Machine. Apply, in writing, stating previous experience and wages required, to the Yorkshire Road Tar Binders, Limited, Standard Buildings, Leeds.
(2,441)

COUNTY BOROUGH OF WEST HARTLEPOOL.

The Corporation require a "Superintendent of Highways and General Foreman," and invite applications from persons under 45 years of age, who must have a thorough knowledge of modern road construction and maintenance, cleansing, watering, &c., and all other duties generally appertaining to such office, to which duties he will be required to devote his whole time.

He must also be experienced in the organisation and supervision of manual and team labour.

The salary will be £156 a year.

Applications, in candidate's own handwriting, made on forms to be obtained from the undersigned, stating age, experience, present and previous appointments, accompanied by copies of three recent testimonials, to be sent to me, endorsed "Suprintendent of Highways," on or before the 15th day of March, 1915.

Canvassing will disqualify any candidate.

NELSON F. DENNIS,
Borough Engineer.

Municipal Buildings, West Hartlepool.
March 3, 1915. (2,436)

COUNTY BOROUGH OF HUDDERSFIELD.

The Education Committee require the services of a competent Temporary Architectural Assistant. The engagement will be for about twelve months, subject to satisfactory service. Candidates must be capable of preparing, under supervision, detail drawings, measuring up, and taking off Quantities. Preference will be given to applicants with previous experience in school buildings. Salary £120 per annum. Applications, in candidate's own handwriting, stating age, and giving full particulars of experience, accompanied by three testimonials of recent date, to be sent to me not later than 10 a.m. on Monday, the 15th March, 1915. Canvassing strictly prohibited.

K. F. CAMPBELL, M.INST.C.E., M.I.E.E.,
Borough Engineer.

1 Peel-street, Huddersfield.
March 3, 1915. (2,437)

URBAN DISTRICT OF WOOD GREEN.

TENDERS FOR PRIVATE STREET WORKS.

The Council invite Tenders for works of Private Street Improvements in (*a*) Lansdowne-road (Section 11), (*b*) Passageway by Alexandra Park Tavern, both within the Urban District.

The Plans, Sections and General Conditions may be seen, and Bills of Quantities obtained, from the Engineer and Surveyor to the Council upon production of a receipt signed by me for a deposit of one guinea, which will be returned on receipt of a *bonâ-fide* Tender, provided the latter is not withdrawn.

Last day for delivering Tenders (which must be sealed and endorsed "Tender for Private Street Works"), Wednesday, 10th March, 1915, at 5 p.m.

The Contractor will be required to execute a formal Contract, and furnish security through an approved Guarantee Insurance Company for the due performance of the same, and also pay the rates of wages and observe the hours of labour specified in the Schedule annexed to the General Conditions.

The lowest or any Tender not necessarily accepted.

(By order)
WM. P. HARDING,
Clerk of the Council.

Town Hall, Wood Green.
March 1, 1915. (2,438)

THE Surveyor to a progressive urban district Council on the S.E. (Kentish) coast is prepared to take a Pupil in his Office, where thorough general experience and personal supervision could be obtained. Water Supply, Sea Outfall, Road Reconstruction, and Groyne Schemes in hand. Two clerical assistants kept. Moderate premium.—Box 1,510, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (2,439)

TWO fully qualified engineering assistants, who are about to terminate a 2½-years' engagement with large County Borough, will shortly be disengaged. Ages 27 and 28 years respectively; municipally trained, and hold testamurs Institution of Municipal and County Engineers. Large experience in all kinds of municipal engineering.—Box 1,511, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (2,440)

A NEW MECHANICAL FILTER.

For many years Messrs. Mather & Platt, Limited, have been engaged in the construction and installation of large-sized pressure filters for public or industrial purposes, and the firm is to possibly for some of the largest plants for the filtration and purification of

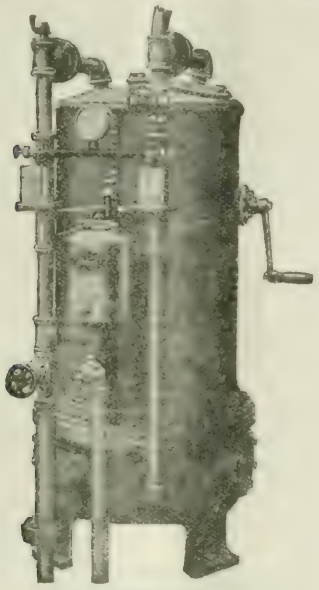

Fig. 1.

water at home and abroad. With the view of meeting the requirements of comparatively small users Messrs. Mather & Platt have now placed on the market a new type of filter specially designed to fulfil the conditions met with in the water supply of public institutions, country mansions, tea and rubber estates, &c., where a cheap and efficient plant for the purification of the water supply is just as much a necessity as in the case of municipalities and large works.

The new filter is illustrated in Fig. 1. Its construction will be readily understood by reference to Fig. 2. The water enters at the top, and, after percolating through the filtering medium, passes through the nozzles into the cast-iron base, and is delivered through the clean-water pipe and valve. A special feature is the design and arrangement of nozzles which are fitted into the base. These are made of phosphor-bronze with copper perforated domes, and give even distribution over the whole bed, both when filtering and during the washing operation. They are screwed in from the underside, access doors being provided so that any nozzle may be taken out, examined and replaced without disturbing the filtering medium.

For supplying the coagulating solution, a small copper tank is provided, which normally holds one day's supply; this tank is secured to the pipes as an integral part of the filter. It is fitted with special valves, a sight glass and regulating jets, by means of which the required quantity of chemical is admitted to the water. Several of these regulating jets are provided, each to give varying proportions of solution, and when it is desired to change them one jet can be substituted for another in a few seconds. To control the supply of solution according to the rate of flow, Messrs. Mather & Platt have introduced a special feature in the shape of an adaptation of the Venturi tube, which ensures that the supply of chemical shall always be in direct proportion to the water supply. It has no moving parts, the action being purely a hydraulic one, and absolutely positive.

The new filter is complete and self-contained. It can be readily transported and erected in any convenient position without special foundations or specially skilled labour. It can be mounted on a motor wagon or other vehicle, and, connected to a pump driven off the main engine, enables pure water to be instantly attainable at any time or place where there is a water supply. It is obvious that this would [illegible] engaged in out-of-the-way places, where the quality of the water is often very doubtful.

Messrs. Mather & Platt [illegible] relating to their new small filter. Copies can be obtained on application to Park Works, Manchester.

SEWAGE DISPOSAL AT FROME.

In his annual report for the year ended March 31st last—some extracts from which were given in our issue of January 29th last—Mr. F. W. Jones, Assoc.M. Inst.C.E., surveyor to the urban district council, makes a reference to the sewage purification works at Frome,

	Total cost.	Cost of treating 1,000,000 gallons.	Rate levied to meet expenditure.	Cost per head of population.
	£ s. d.	£ s. d.	d.	s. d.
Administrative charges	121 1 7	1 8 2	1·31	1 1¼
Capital charges ..	1,428 19 4	6 [illegible]	10·89	2 11½
Totals	2,250 3 11½	8 11 5	15·63	4 1

which, completed at a cost of £20,075, were put into operation in May, 1912.

The cost of dealing with 1,000,000 gallons of sewage, based upon the quantity arriving at the works, and upon the basis of population taken on the last census,

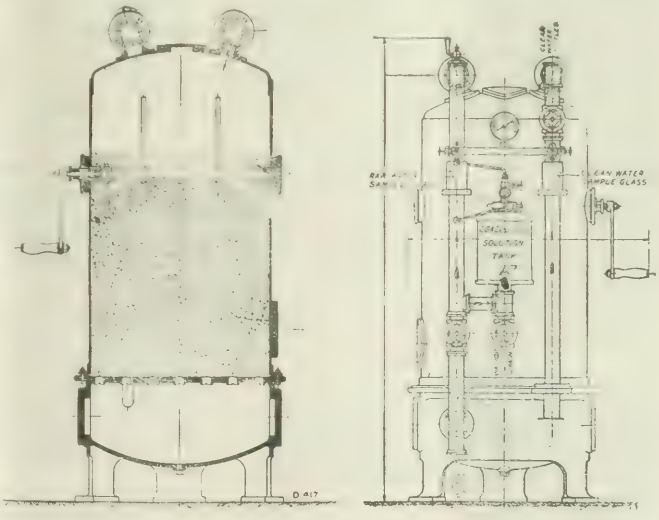

Fig. 2.

is given in the above table both for the administrative and capital charges.

Very satisfactory effluents have been obtained since the inauguration of the works. Apart from a few tons of coke breeze—which is obtained at the price of 2s. per ton—all steam required for sewage pumping has been obtained from the destruction of town refuse.

MIXING OF CONCRETE.

EFFECT OF VARYING AMOUNT OF WATER.

In a paper read before the Connecticut Society of Engineers recently, results are given of a series of careful tests made to determine the effect of varying the percentage of water in concrete. Summarised, the conclusions drawn are as follow:—

The percentage of water has a direct bearing upon the strength of concrete. Nevertheless, it is the exception rather than the rule that the engineer concerns himself with the question of mixing beyond seeing that the proper proportions of sand, stone and cement are used. Careful tests are made of the cement and steel, both standard articles put out by firms which have reputations to maintain; on rare occasions the water is analysed, but no attempt is made to control the mixing. On some pieces of work the contractor is furnished the cement, so that there will be no temptation to skimp on materials. He is then given the liberty to mix these materials as he sees fit. He may aim to get the maximum strength out of them, but it is probable that he will strive rather to keep the cost of mixing and placing at a minimum.

Of course, it must be admitted that the strongest mixture is not always the most desirable or economical. In preparing the specimens for these tests it was found necessary, when making mixtures containing more than 27·5 per cent of water, to increase the proportions 10 per cent in order to fill the moulds. This indicates an increase in density which was obtained at a loss of strength. However, in some cases this is highly desirable. Often bulk and impermeability are the two requisite features. In reinforced-concrete structures a moderately wet mixture is far more practical than a dry one; but it must not be forgotten that the use of wet mixtures increases the cost of materials. An increase in density means a corresponding increase in raw materials. The additional water weakens the concrete, and therefore a richer mixture or lower unit stresses must be used. The former is preferable, for the beams and columns in concrete building are always heavier than the corresponding members of steel or wooden structures.

If a wet mixture is used, the engineer should be cautious in permitting the removal of the forms at an early date. In some of the tests the wet mixtures were very slow to develop their strength. The use of such consistencies in practice would necessitate extreme care. It might be a month or more before the forms could be struck with any feeling of security.

The question of consistency is not altogether a laboratory question. The increased cost of materials due to the use of wet mixtures may be more than balanced by the saving in placing; but the engineer should bear in mind that consistency has a direct relation to strength, and if he permits a wet mixture he should provide for the same in his design. In any event he should control the details of the mixing.

Architects' War Committee.—The Professional Employment Committee have under consideration certain schemes of work with a view to affording small temporary employment to architects who are without work in consequence of the war. Applications can only be considered from British architects dependent on their profession for a living, whose present difficulties are directly due to the war, and who are not eligible for military service. Applications should, in the first instance, be made to the hon. secretary of the Professional Employment Committee of the Architects' War Committee, 28 Bedford-square, W.C.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

DISTRICT SURVEYOR.—March 8th.—For the district of Rotherhithe.—Clerk, London County Council, County Hall, Spring-gardens, London, S.W.

GAS ENGINEER AND MANAGER.—March 8th.—Corporation of Mossley. £250—£300 a year.—The Town Clerk.

FOREMAN.—March 8th.—Pontypridd Urban District Council. £110—£130 per annum.—Mr. J. C. Jones, clerk.

ROAD FOREMAN.—March 8th.—Durham County Council. 50s. per week.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

SURVEYOR.—March 11th.—Louth Rural District Council. £100 per annum.—Mr. F. C. Chard, clerk.

CLERK OF WORKS.—March 12th.—Mayo County Council. £2 10s. per week.—Chairman, County Council Offices, Castlebar.

TEMPORARY TOWN PLANNING ASSISTANT.—March 15th.—Hazel Grove and Bramhall Urban District Council. £2 5s. per week.—Mr. G. Severn Doncaster, surveyor, Public Offices, Hazel Grove.

WORKS SUPERINTENDENT.—March 15th.—West Ham Town Council. £250 per annum.—Mr. J. S. D. Moffat, tramways manager, Tramway Offices, Greengate-street, Plaistow, E.

MECHANICAL ENGINEER.—March 16th.—North Bromsgrove Urban District Council.—Mr. Francis T. Levens, clerk, 110 High-street, Bromsgrove.

COUNTY SURVEYOR.—March 20th.—Notts County Council. £500 per annum.—Mr. H. Hampton Copnall, clerk, Shire Hall, Nottingham.

CLERK OF WORKS.—March 20th.—Blaenavon Urban District Council. £130 per annum.—Mr. I. G. G. Thomas, clerk.

SANITARY INSPECTOR.—March 25th.—Sutherland County Council. £120 per annum.—Mr. A. Argo, county clerk, Golspie, Sutherlandshire.

SURVEYOR OF HIGHWAYS.—March 25th.—Abingdon Rural District Council. £2 10s., to a maximum of £150.—Messrs. B. & E. M. Challoner, clerk, 67 Stert-street, Abingdon.

ASSISTANT ENGINEERS.—Public Works Department of the Government of the Gold Coast. £350—£400 a year.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

CLERKS.—Corporation of Chelmsford. £2 2s. and £1 10s. per week.—Mr. Percival T. Harrison, borough engineer and surveyor.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

BRADFORD.—March 31st.—Designs for the replanning of streets, for the corporation.—The Town Clerk.

GALEMIRE.—Designs for a small hospital, for the Galemire (Whitehaven) Joint Hospital Committee.—Mr. E. B. Croasdell, clerk, Union Hall, Whitehaven.

STEPNEY.—Designs for municipal buildings, for the borough council. Mr. H. T. Hare, F.R.I.B.A., has been appointed assessor.—Mr. G. W. Clarke, town clerk, 15 Great Alie-street, Whitechapel.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Buildings.

CHELMSFORD.—March 8th.—For the erection of two or four cottages, for the rural district council.—Mr. J. Dewhurst, engineer and surveyor.

NORTH DUBLIN.—March 9th.—For the erection of sixty-nine cottages, for the rural district council.—Mr. J. O'Neill, clerk.

DEPTFORD.—March 9th.—For the erection of baths and wash-houses and a branch library, for the borough council.—Mr. A. Purkis, town clerk, Town Hall, New Cross.

WATFORD.—March 9th.—For the erection of two pairs of semi-detached cottages, for the rural district council.—Council Offices, 9 Market-street, Watford.

BRIDGWATER.—March 9th.—For the erection of a temporary hospital, for the corporation.—Borough Surveyor.

NORTHWICH.—March 10th.—For sinking a borehole, for the urban district council.—Messrs. J. Newton, Son & Bayley, 19 Cooper-street, Manchester.

LLANDUDNO.—March 10th.—For the erection of an

office, for the urban district council.—Mr. W. T. Ward, deputy engineer and surveyor, Town Hall.

BINGLEY.—March 10th.—For additions to offices, for the urban district council.—Mr. H. Bottomley, engineer and surveyor.

PORTLAND.—March 10th.—For the erection of new council offices, for the urban district council.—Messrs. Petter & Warren, architects, Yeovil.

ALFORD.—March 11th.—For the erection of a school, for the Alford School Board.—Messrs. D. & J. R. McMillan, architects, 105 Crown-street, Aberdeen.

GLOUCESTER.—March 11th.—For the erection of a pumping station and other works, for the corporation.—Messrs. Fox, Moore, Baterman & Fox, 5 Victoria-street, Westminster, S.W.

ASSISTANT ELECTRICAL ENGINEER.—March 11th.—Redditch Urban District Council. £170 a year.—Mr. G. W. Robson, clerk.

NOTTINGHAM.—March 11th.—For the erection of twenty-seven cottages and two blocks of tenements, for the corporation.—Mr. A. Brown, city engineer, Guildhall.

MACCLESFIELD.—March 13th.—For the erection of a chimney shaft, for the Baths Committee.—Mr. S. C. Baggott, borough surveyor.

SOMERSET.—March 13th.—For the erection of a school, for the Education Committee.—Messrs. Samson & Colthurst, architects, 1 Hammet-street, Taunton.

BRADFORD.—March 13th.—For the erection of a destructor, for the corporation.—City Architect.

LLANDILOFAWR.—March 15th.—For the construction of Rhydymaerdy Bridge across the river Amman, for the rural district council and the Ammanford Urban District Council.—Mr. Evan Jones, surveyor, Glancennen, Llandebie, and Mr. David Thomas, surveyor, Quay-street, Ammanford.

BOLTON-UPON-DEARNE.—March 15th.—For the erection of 288 dwelling-houses, for the urban district council.—Messrs. Garside & Pennington, architects, Ropergate, Pontefract.

BOLTON-UPON-DEARNE.—March 15th.—For the erection of 293 houses and eight houses and shops, for the urban district council.—Messrs. Garside & Pennington, architects, Ropergate, Pontefract.

TREDEGAR.—March 15th.—For the erection of a caretaker's lodge at the cemetery, for the urban district council.—Mr. W. Lloyd Roach, surveyor.

HAMPSHIRE.—March 17th.—For the erection of a school, for the county council.—Mr. A. L. Roberts, architect, The Castle, Winchester.

WALLASEY.—March 18th.—For the erection of workshop and men's room, and the construction of foundation for gas engine, for the corporation.—Mr. J. H. Crowther, engineer and manager of the gasworks, Limekiln-lane, Wallasey.

READING.—March 18th.—For the erection of a public convenience, for the corporation.—Mr. J. Bowen, borough engineer and surveyor.

HEMSWORTH.—March 20th.—For laying water mains, for the rural district council.—Mr. T. H. Richardson, engineer, Hemsworth.

STEVENAGE.—March 22nd.—For the erection of eight cottages, for the urban district council.—The Surveyor.

CHELMSFORD.—March 22nd.—For the erection of an engine-house and incidental works, for the corporation.—Mr. P. T. Harrison, borough engineer.

SOUTHALL-NORWOOD.—March 23rd.—For the erection of fifty-four houses, for the urban district council.—Mr. R. Brown, engineer and surveyor, Southall.

NORTHAMPTON.—March 25th.—For the erection of twenty cottages, for the corporation.—Waterworks Office, Fish-street, Northampton.

ASSISTANT ENGINEERS.—April 1st.—Indian Public Works and State Railways Departments.—Secretary, Public Works Department, India Office, London, S.W.

ANGLESEY.—April 7th.—For the erection of new schools, for the Education Committee.—Mr. J. Owen, county architect, Menai Bridge.

DRAUGHTSMEN.—Sierra Leone Government, Public Works Department. £300—£350.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

DRAUGHTSMAN.—Nigerian Government Railway. £300—£350 per annum. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

Iron and Steel.

BURY (Lancs).—March 8th.—For structural steel and steel window frames at the generating station, for the corporation.—Mr. J. A. Settle, borough engineer, Bank-street.

PLYMOUTH.—March 9th.—For the supply of cast-iron pipes, for the corporation.—Mr. F. Howarth, city engineer.

EDINBURGH.—March 10th.—For the supply of 1,100 tons of cast-iron pipes for the Water Trustees.—Messrs. J. & A. Leslie & Reid, engineers, 12 St. Giles-street, Edinburgh.

CUDWORTH.—March 10th.—For the supply of cast-iron gas main, for the urban district council.—Mr. W. T. Lynam, manager, gasworks, Cudworth.

CLEETHORPES.—March 11th.—For the supply and erection of a steel beacon, for the urban district council.—Messrs. Chatterton & Alford, 9 Victoria-street, Westminster, London, S.W.

COVENTRY.—March 15th.—For the supply of cast-iron pipes, lead pipes, solder, and hydrant and valve boxes, for the corporation.—The Water Engineer, St. Mary's Hall, Coventry.

CHELMSFORD.—March 17th.—For the supply of pumping machinery, and for the provision and erection of a pumping installation, complete with all incidental works, for the corporation.—Mr. Percival T. Harrison, borough engineer.

WALLASEY.—March 18th.—For the supply and erection of a G.B. elevator and coke-screening plant at the gasworks, for the corporation.—Mr. J. H. Crowther, engineer and manager, Limekiln-lane, Wallasey.

HEMSWORTH.—March 20th.—For supplying and laying cast-iron mains, for the rural district council.—Mr. T. H. Richardson, engineer, Hemsworth.

BELPER.—March 25th.—For providing and laying cast-iron pumping main, for the urban district council.—Messrs. G. & F. W. Hodson, Bank Chambers, Loughborough.

CARMARTHEN.—March 26th.—For providing and laying water mains, for the rural district council.—Mr. W. E. Jones, surveyor, Rock Hill, Llanarthney.

BLACKBURN.—For the supply of iron, steel, bolts, and screws, for the corporation.—Mr. J. H. Cowell, Tramways Manager.

Roads.

SOUTHWELL.—March 8th.—For the supply of road material, for the rural district council.—Mr. A. Edwards, highway surveyor, Edwinstowe, Newark.

FLEETWOOD.—March 8th.—For the supply of road materials, for the urban district council.—Mr. A. Cottam, clerk.

DURHAM.—March 8th.—For the supply of road materials, for the county council.—Mr. A. E. Brookes, county surveyor, Shire Hall, Durham.

LEAMINGTON.—March 8th.—For the supply of 3,000 tons of road stone, for the corporation.—Road Surveyor, Adelaide-road.

WING.—March 8th.—For the supply of 800 tons of granite, and 1,200 tons of slag, sand and gravel, for the rural district council.—Mr. M. G. Gurney, surveyor.

CHORLEY.—March 8th.—For the supply of road materials, for the rural district council.—Mr. P. Whalley, highway surveyor, High-street, Chorley.

BUCKLOW.—March 8th.—For the supply of granite setts and macadam, gritt setts and slag, for the rural district council.—Mr. R. Curtis Cordon, surveyor, Knutsford, Cheshire.

DURHAM.—March 8th.—For the hire of steam rollers and steam tractor hauling plants, for the county council.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

FAVERSHAM.—March 9th.—For the supply of broken pit flints, shingle, and fine gravel, for the rural district council.—Mr. J. G. Chittenden, district surveyor, Ashford-road, Faversham.

UPPINGHAM.—March 9th.—For the supply of granite and screenings, for the rural district council.—Mr. F. Oakley, clerk.

RYE.—March 9th.—For the supply of materials, for the rural district council.—Mr. L. Amon, Watch Bell Chambers, Rye, Sussex.

SCULCOATES.—March 9th.—For the supply of stone, gravel, asphalt, tar, and coal for steam roller, for the rural district council.—Mr. A. Culkin, surveyor, 113 Alliance-avenue, Hull.

CHESTERTON.—March 9th.—For the supply of 5,000 tons of broken granite, for the rural district council.—Mr. J. Dunn, surveyor.

HOYLAKE.—March 9th.—For the supply of kerbs, channels, setts, cement concrete flags and macadam, chippings, for the urban district council.—Engineer and Surveyor.

BOLLINGTON.—March 9th.—For paving work and the supply of 1,000 tons of granite setts, for the urban district council.—Mr. H. W. A. Carter, surveyor.

FOLESHILL. — March 9th. — For the supply of granite, for the rural district council.—The Surveyor.

WHITEHAVEN.—March 10th.—For works of road improvement, for the rural district council.—Mr. G. Boyd, Union Hall, Whitehaven.

LEWISHAM.—March 10th.—For the supply of broken granite, for the borough council.—Borough Surveyor, Town Hall, Catford, S.E.

RAINFORD.—March 10th.—For the supply of macadam, chippings and dust, tarred macadam, and tarred chippings, for the urban district council.—Mr. B. Smith, clerk.

BIRMINGHAM.—March 10th.—For the construction of Elmhurst-road, Grove Hill-road, Headingley-road, and Uplands-road (part of), Handsworth, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor.

HARTISMERE.—March 10th.—For the supply of 2,700 tons of 1¾-in. granite and 1,395 tons of pit stones, for the rural district council.—Mr. Harold Warnes, clerk, Eye, Suffolk.

HAYES.—March 10th.—For the supply of 8,000 gallons of refined coal tar complying with the Road Board specification, for the urban district council.—Mr. D. C. Fidler, surveyor, Council Offices, Hayes End, Middlesex.

ENFIELD.—March 10th.—For making up Queen's-road and Stanley-road, for the urban district council.—Mr. Richard Collins, surveyor.

LOFTUS.—March 10th.—For the supply of highway materials, for the urban district council.—Mr. B. J. Wormleighton, surveyor.

ROCHDALE.—March 10th.—For making good certain passages, for the corporation.—Borough Surveyor.

RAWTENSTALL.—March 11th.—For making up certain streets, for the corporation.—Mr. J. Johnson, borough surveyor.

SUTTON (Surrey).—March 11th.—For the tar-spraying of various roads in the district, for the urban district council.—Mr. Hedley Grieves, surveyor.

LEEDS.—March 11th.—For making up certain streets, for the corporation.—Highways and Permanent Way Department, 155 Kirkstall-road, Leeds.

CAISTOR.—March 12th.—For the supply of 7,100 tons of granite, 4,760 tons of slag, and 800 tons of tar-macadam, for the rural district council.—Mr. A. A. Padley, clerk.

MAYO.—March 12th.—For steam rolling about 12 miles of roads, for the county council.—Mr. E. K. Dixon, county surveyor, Castlebar.

CORK.—March 12th.—For the supply of stones for macadamised roads, for the corporation.—City Engineer.

DURHAM.—March 12th.—For the supply of whinstone, slag, tar-macadam, pitch, tar, creosote oil, and cartage, for the rural district council.—Mr. G. Gregson, surveyor.

EASTRY.—March 12th.—For the supply of flints and steam rolling, for the rural district council.—Mr. D. E. Foster, surveyor, Dover-road, Sandwich.

STAINES.—March 12th.—For the supply of broken macadam and chippings, Kentish ragstone, and Derbyshire or Somerset limestone, for the rural district council.—Mr. G. W. Manning, surveyor.

KING'S LYNN.—March 13th.—For the supply of road materials for the year, for the corporation.—Mr. Alfred J. Smith, borough surveyor.

PONTARDAWE.—March 13th.—For the supply of road metal and haulage, for the rural district council.—Mr. J. Morgan, engineer.

GAINSBOROUGH.—March 13th.—For the supply of road materials, for the urban district council.—Mr. S. W. Parker, engineer and surveyor.

AYLESBURY.—March 13th.—For the supply of 2,706 tons of granite and 610 tons of slag, for the rural district council.—Mr. J. Cook, surveyor.

GREAT OUSEBURN.—March 13th.—For the supply of whinstones, limestones, annealed slag, and furnace slag, for the rural district council.—Mr. H. S. Thompson, clerk, Boroughbridge.

HASTINGS.—March 15th.—For the supply of 40,000 gallons of refined or distilled tar, for the corporation.—Mr. P. H. Palmer, borough engineer.

WREXHAM.—March 15th.—For the supply of road stone, for the rural district council.—The Surveyor.

BILSTON.—March 15th.—For the supply and delivery of broken stone, for the urban district council.—Mr. Vincent Turner, engineer and surveyor.

WEST SUFFOLK.—March 15th.—For the supply of local stone, gravel, tools, surface tarring, and the hire of steam rollers, for the county council.—Mr. W. Lionel Jenkins, county surveyor, Shire Hall, Bury St. Edmunds.

SUTTON COLDFIELD.—March 15th.—For the supply of road materials, for the corporation.—Mr. W. A. H. Clarry, borough engineer and surveyor.

POCKLINGTON.—March 15th.—For the supply of best blue stone and rag, for the rural district council.—Mr. T. Robson, clerk.

MAIDSTONE.—March 15th.—For the supply of ragstone spalls, setts, kerbs, flints, tarred ragstone, tarred ragstone macadam, gravel and sand, for the corporation.—Mr. T. F. Bunting, borough surveyor.

HAVERHILL.—March 15th.—For the supply of broken granite, slag, and slag tar-macadam, for the urban district council.—Mr. John H. Clarke, surveyor.

HAZEL GROVE.—March 16th.—For the supply of broken stone, setts, kerbs and chippings, for the urban district council.—Mr. G. Severn Doncaster, surveyor.

KIDDERMINSTER.—March 16th.—For the supply of broken granite, granite screenings, broken slag, and slag screenings, for the rural district council.—Mr. G. J. Shepherd, surveyor, 85 Chester-road, Kidderminster.

TUTBURY.—March 17th.—For the supply of broken granite and limestone, for the rural district council.—Mr. F. Rist, surveyor, Tatenhill, Burton-on-Trent.

ELY.—March 17th.—For the supply of 3,150 tons of granite, and 1,050 tons of gravel, for the rural district council.—Mr. F. W. Firby, district surveyor, Sutton, Isle of Ely.

EASTBOURNE.—March 17th.—For the supply of Kentish ragstone, Portslade flints, compo. sand, tar, hand-picked flints, and cartage, for the rural district council.—Mr. C. M. Carter, district surveyor, Mount Sorrel, Hampden Park, Eastbourne.

NELSON.—March 17th.—For the supply of granite macadam, limestone macadam, paving chippings, pitch, cement, flags, kerb, grit setts, and creosote oil, for the corporation.—Mr. W. Shackleton, borough engineer and surveyor.

DONCASTER.—March 18th.—For the supply of dross, granite, carting, and manual labour, for the rural district council.—Mr. W. R. Crabtree, highway surveyor.

CHAILEY.—March 18th.—For the supply of flints, quartzite, Kentish rag, Mendip stone, and gravel, for the rural district council.—Mr. H. Kemp Walls, district surveyor, North Common, Chailey.

OSWESTRY.—March 20th.—For the supply of broken granite and broken and unbroken limestone, for the rural district council.—Mr. C. H. Bull, clerk.

SOUTHBOROUGH.—March 20th.—For the supply of 800 tons of basalt, granite, or other suitable stone, for the urban district council.—The Surveyor.

KIVETON PARK.—March 20th.—For the supply of broken slag, granite and tar-macadam, for the rural district council.—Mr. F. Hewitt, surveyor.

CASTLEFORD.—March 22nd.—For works of street improvement, for the urban district council.—Mr. W. Green, surveyor.

COVENTRY.—March 22nd.—For the supply of broken road stone, granite kerbs, granite setts, stoneware pipes, castings, and workmen's tools, for the corporation.—City Engineer.

PERSHORE.—March 23rd.—For the supply of stone and stone hauling in the district, for the rural district council.—Mr. A. E. Baker, clerk.

EAST STOW.—March 24th.—For making up Victoria-road, Stowmarket, for the rural district council.—Mr. H. E. Wilkes, clerk, Market-place, Stowmarket.

STROOD.—March 24th.—For the supply of road materials, for the rural district council.—Mr. L. Randerson, surveyor, Meopham, near Gravesend.

GATESHEAD.—March 27th.—For the supply of road materials, for the corporation.—Mr. N. P. Pattinson, borough engineer.

DROXFORD.—March 29th.—For the supply of 1,250 tons of granite or hard stone, for the rural district council.—Mr. J. King, surveyor, Droxford, Hants.

GATESHEAD.—March 30th.—For cement path work in position, for the corporation.—Mr. N. P. Pattinson, borough engineer.

Sanitary.

STOKE-ON-TRENT.—March 8th.—For the supply of press cloths, lime, chemicals, coal and slack, petroleum, and lubricating oils, for the sewage department.—Sewage Engineer, Leek-road, Stoke-on-Trent.

BOOTLE.—March 8th.—For sanitary improvements, for the corporation.—Borough Engineer.

BURRY PORT.—March 8th.—For the construction of a system of sewerage for the district of Burry Port, comprising cast-iron and stoneware pipe sewers, manholes, lampholes, flushing tanks, ventilating shafts, and other incidental works, for the urban district council.—Mr. A. P. I. Cotterell, 17 Old Queen-street, Westminster, and 28 Baldwin-street, Bristol.

STOCKTON-ON-TEES.—March 9th.—For the construction of a pipe sewer and manholes, and the under-drainage of land for sewage disposal purposes, for the rural district council.—Mr. J. Rodham, surveyor, Finkle-street.

MELTON MOWBRAY.—March 10th.—For the construction of a 9-in. sewer and the erection of ventilating shafts, for the rural district council.—Mr. G. E. Fryer, surveyor.

HAWARDEN.—March 12th.—For scavenging several sub-districts, for the rural district council.—Sanitary Inspector.

WIRRAL.—March 12th.—For the construction of sewage disposal works, for the rural district council.—Mr. W. W. Shennan, engineer and surveyor, 9 Hamilton-square, Birkenhead.

TIPTON.—March 15th.—For the construction of a sewer, for the urban district council.—Mr. W. H. Jukes, engineer and surveyor.

ROCHFORD.—March 15th.—For the removal of house refuse, for the rural district council.—Mr. F. Greg-on, Southend.

GLASGOW.—March 15th.—For the construction of sewers, for the corporation.—Office of Public Works, 64 Cochrane-street.

KEIGHLEY.—March 15th.—For emptying privies and ashpits, for the rural district council.—Mr. T. Burton, inspector.

PONTYPRIDD.—March 15th.—For the supply of disinfectants, for the urban district council.—Medical Officer of Health.

ALCESTER.—March 16th.—For scavenging certain districts, for the rural district council.—Mr. C. B. Machin, sanitary inspector.

THURROCK.—March 16th.—For the construction of about 4 miles 1 furlong 10 yards of sewers 9-in., 12-in. and 15-in. diameter, together with manholes and other appurtenances, for the Thurrock, Grays and Tilbury Joint Sewerage Board.—Mr. G. Midgley Taylor, engineer, Caxton House, Westminster, S.W.

WANDSWORTH.—March 17th.—For surface-water drainage works at Wandsworth Common, for the borough council.—Borough Engineer, 215 Balham High-road, S.W.

ECCLES.—March 20th.—For the construction of about 500 lin. yds. of egg-shaped sewer, 72 lin. yds. of egg-shaped sewer, 70 lin. yds. of stoneware pipe sewer, eleven manholes, and additions and alterations to existing manholes, for the corporation.—Mr. Thomas S. Picton, borough engineer.

INCE.—March 22nd.—For the construction of sewage disposal works, for the urban district council.—Mr. A. T. Swain, engineer and surveyor.

FINCHLEY.—March 24th.—For the construction of four chamber sewage filters, for the urban district council.—Mr. C. J. Jenkin, engineer, Council Offices.

Stores.

CHORLEY.—March 8th.—For the supply of broken granite and slag, rubble, chippings, grit setts, concrete flags, grit kerbs, earthenware pipes, pitch and oil, tools and implements, for the rural district council.—Mr. Percival Whalley, highway surveyor, Council Office.

BARNES.—March 8th.—For the supply of broken Guernsey or Alderney granite, broken pit flints and Thames ballast, disinfectants, ironmongery, Portland cement, forage and litter, granite kerb and channel, oils, paints, stoneware pipes, and horses and carts on hire, for the urban district council.—Engineer and Surveyor.

EPSOM.—March 9th.—For the supply of sewerage ironwork, gully gratings, shovels, picks, brooms, forks, dust skeps, disinfectants, Portland cement, stoneware pipes and gullies, kerbing and channelling, setts, broken granite, chippings and limestone dust, tar-paving and tar-macadam, coal and coke, hay, corn, bran, straw, bricks, paraffin, artificial stone paving, Thames ballast, Thames sand, veterinary surgeon's services, tar, pitch, and team labour, for the urban district council.—Mr. Edward R. Capon, surveyor, Bromley Hurst, Church-street, Epsom.

EXETER.—March 10th.—For the supply of bricks, bass brooms and refilling stocks of sweeping machines, Portland cement, building lime and slates, cast-iron pipes, granite channelling and kerb, York stone flags, concrete flags, stoneware pipes, miscellaneous iron castings, stone, sand, timber, ironmongery, and oils, for the corporation.—City Surveyor, Municipal Offices, Exeter.

GOOLE.—March 10th.—For the supply of broken granite, slag, tarred slag macadam, concrete flags, York stone flags, kerb, channel, stoneware pipes, Portland cement, gravel, sand, and coal, for the urban district council.—Mr. J. H. Castle, engineer and surveyor.

TWICKENHAM.—March 11th.—For the supply of ballast, shingle, flints, gravel, sand, granite cubes, setts, Portland cement, coal, coke, fodder, forage, oils, colours, iron castings, street gullies, and drain pipes, for the urban district council.—Mr. Fred. W. Pearce, surveyor.

NEWCASTLE-UPON-TYNE.—March 11th.—For the supply of bricks, cement, clot lime, flags (artificial, freestone and Caithness), hose pipes, iron, steel, horse-shoe nails, pitch, tar, creosote oil, paints, oils, privy pans, ashbins, road stones, sanitary pipes, scavenging brooms, shovels, timber, and waterproof coats and boots, for the corporation.—City Engineer.

WOLSTANTON.—March 12th.—For the supply of granite, cold-blast slag, granite chippings, tarred cold-blast slag, tarred granite, tar for tar-spraying, setts, paving bricks, kerbs, best glazed socket pipes, tar-spraying, anthracite, and alumino-ferric, for the urban district council.—Mr. W. F. Slater, surveyor.

EAST HAM.—March 12th.—For the supply of glazed stoneware pipes, glazed stoneware gully fittings, Portland cement, grey stone, chalk and blue lias lime, lime for sewage precipitation, stock and other bricks, Thames ballast, sand, coal, coke, engineers' sundries, broken granite, crushed granite, granite setts, Guernsey and other granite chippings, granite kerb and channelling, broken flints, cast-iron work, gullies, shovels, brooms, disinfectants, oilskins, hire of horses and carts, sewer ventilating columns, paving flags, sewer smocks, and redressing of setts, for the corporation.—Mr. C. Eustace Wilson, town clerk.

GAINSBOROUGH.—March 13th.—For the supply of broken granite or whinstone macadam, granite or whinstone setts, broken and block slag, slag chippings and dust, York setts, kerbs, channels, flags, concrete flags, stoneware and earthenware pipes, gullies, cast-iron pipes, tar-macadam, pitch and creosote oil, Portland cement and coal, for the urban district council.—Mr. S. W. Parker, engineer and surveyor.

SUTTON COLDFIELD.—March 15th.—For the supply of granite macadam and kerb, limestone macadam and setts, gravel and broken pebble stones, Yorkshire or pennant kerb, Rowley setts, earthenware pipes, cement and lime, iron castings, iron and steel, timber, hardware, oils and paints, and bass brooms, for the corporation.—Mr. W. A. H. Clarry, borough engineer and surveyor, The Council House, Sutton Coldfield.

COLNE.—March 15th.—For the supply of Lancashire and local setts, Portland cement, granite macadam, limestone macadam, lime, ironwork, team labour, kerbs and channels, pitch, creosote oil, earthenware pipes and gullies, and brushes, for the corporation.—Mr. T. H. Hartley, borough surveyor.

HEYWOOD.—March 20th.—For the supply of earthenware pipes, bends, junctions, taper pipes, traps, gullies, setts, kerbs, flags, pitch, creosote oil,

limestone chippings, granite macadam, granite chippings, Portland cement, cast iron, scavenger brooms and refilling machine brush, and paraffin oil, for the corporation.—Mr. J. B. Nuttall, borough surveyor.

LEEK.—March 22nd.—For the supply of flags, kerbs, channels, setts, macadam stone, chippings, limestone and slag tar-macadam, Portland cement, sanitary pipes, pitch, oil, scavengers' bass brooms, cast-iron manhole and lamphole covers, galvanised malleable manhole step irons, cast-iron gullies and frames, for the urban district council.—Mr. W. E. Beacham, engineer and surveyor.

EASTBOURNE. March 22nd. For the supply of Portland cement, cast-iron goods, wrought-iron goods, tools, miscellaneous ironmongery, oils, colours, glazed stoneware pipes, brooms and brushes, for the corporation. Mr. A. Ernest Prescott, borough surveyor.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

EASINGWOLD. Accepted for the supply of whinstone and slag, for the rural district council.—Mr. G. Thompson, surveyor:—

Whinstone. R. Summerson & Co., Cockfield; Ord & Maddison, Darlington; Monkhouse & Peart, Cowshill, Durham; G. Hodsman, York; Shackleton & Son, Goole.
Slag. W. H. Musgrave, Middlesbrough; G. Hodsman, York; W. C. Clark, Darlington; E. C. Tomkins, Middlesbrough; C. Mildred, Middlesbrough; J. N. Smith & Co., Leeds; Shackleton & Son, Goole; Mead & Co.
Tarred Slag. W. H. Musgrave, Middlesbrough; Mildred Partners, Middlesbrough; J. N. Smith & Co., Leeds; E. C. Tomkins, Middlesbrough; Slag and Tar Macadam Company, Darlington; Mead & Co.

CHISWICK. The following tenders are recommended for the acceptance of the urban district council by the General Purposes Committee:—

Lime, Cement, Plaster, &c.—Sankey & Co., Hammersmith; J. Knowles & Co., London.
Aluminoferric.—P. Spence & Sons, Limited, Manchester.
Copperas.—D. Matthews, Swansea.
Jute Press Cloths.—Woods, Sons & Co., London.
Oils (excepting Petrol).—Middleton Brothers, London; Robertson & Sons, Chiswick.
Tarred Limestone and Derbyshire Spar. J. Smart & Son, Westminster, S.W.
Tarred Slag and Siftings.—Prestwich & Sons, Dronfield.
Tarred Granite and Chippings.—Whitwick Granite Company, Limited, Whitwick.
Pipes and Gullies.—Sankey & Co., Hammersmith; J. Knowles & Co., Limited, St. Pancras, N.W.; Doulton & Co., Limited, London, S.E.
Tar.—Gas Light and Coke Company, London, E.C.; Clare & Co., Limited, Liverpool (Tarco).
Granite.—Brookes, Limited, Westminster, S.W. (Guernsey granite); Mountsorrel Granite Company, Limited, Loughborough (Mountsorrel granite).
Asphalt.—Limmer Asphalte Paving Company, Westminster, S.W.
Disinfectants.—Burt, Boulton & Haywood, Limited, London, E.C. (disinfectant powder); Forbes, Abbott & Lennard, Limited, London, E.C. (disinfecting fluid and creosote); Newton Chambers & Co., Limited, London, W.C. (Izal).
Kentish Flints and Hoggin.—Fry Brothers, Limited, Greenwich.
York Stone Paving.—H. Brooks, Yorkshire (subject to sample being satisfactory).
Artificial Stone Paving.—Brookes, Limited, Westminster, S.W. (Granolite); Atlas Stone Company, Limited, Cambridge (Atlas); Excelsior Patent Stone Company, Northamptonshire (Excelsior); Adamant Stone and Paving Company, Limited, Westminster, S.W. (Adamant); Threlkeld Granite Company, Limited, Cumberland (Threlkeld).

KNOTTINGLEY.—For extensions of main sewers, for the urban district council.—Mr. A. Hartley, consulting surveyor:—

J. Rodger & Son, Castleford	£747
E. A. Greaves, Castleford *	699

MARPLE.—Accepted for the supply of road materials and sanitary pipes, for the urban district council.—Mr. D. J. Diver, surveyor:—

Granite. — Pwllheli Granite Company; Penmaenmawr Granite Company.
Limestone.—J. Goddard, Marple.
Macclesfield Stone.—Ashton & Holmes, Macclesfield.
Derbyshire Setts.—Woodhead & Farrer, Mellor, Derbyshire.
Sanitary Pipes.—J. Duckett & Co.

MARSHLAND.—Accepted for the erection of houses, for the rural district council.—Mr. E. A. Walker, architect, Wisbech:—

Clenchwarton.—Wilkinson & Co., Wisbech (3 prs.), £1,230.
Emneth.—Wilkinson & Co., Wisbech (4 prs.), £1,520.
Lakesend.—Wilkinson & Co., Wisbech (2 prs.), £840.
Nordelph.—Elworthy & Co., Wisbech (3 prs.), £1,317.
Walpole St. Andrew.—G. J. West, Wisbech (3 prs.), £1,258.
Walpole St. Peter.—E. R. Langfer, Wisbech (3 prs.), £1,243.
West Walton.—A. T. Horsley, Wisbech (2 prs.), £799.
Three Holes.—J. Parker, Wisbech (4 prs.), £1,406.
Terrington, St. Clement.—No. 1 site: R. Eggleton, King's Lynn (2 prs.), £810. No. 2 site: H. W. Reeder, King's Lynn (2 prs.), £828.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

MARCH.

9.—Institution of Civil Engineers: Sir Thomas Mason, Assoc.M.Inst.C.E., on "The Improvement of the River Clyde and Harbour of Glasgow, 1873-1914." Ballot for new members. 8 p.m.
11. Society of Architects: Mr. A. Montefiore Brice, Barrister-at-Law, on "The Law Relating to the Remuneration of the Architect." 7.30 p.m.
18.—Mr. E. B. B. Newton, Borough Engineer of Paddington, on "The Use, Abuse, and Misuse of Roads." Municipal and County Club. 8.30 p.m.

MAY.

28.—Royal Sanitary Institute: Meeting at Shrewsbury. Discussion on "The Value of Mechanical Filters in the Purification of Water." 7.30 p.m.

APPOINTMENTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SURVEYOR to rural district council in Kent has vacancy for Articled Pupil. Excellent opportunities.—Apply Box No. 1,508, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (2,429)

HAZEL GROVE AND BRAMHALL URBAN DISTRICT COUNCIL.

Applications are invited for the position of Temporary Town Planning Assistant in the Surveyor's Office (in lieu of one recently joined H.M. Army). Salary £2 5s. per week.

Applicants must be experienced levellers and surveyors, neat and quick draughtsmen, and thoroughly reliable in every way. One having had town planing or extensive field experience preferred.

Applications, in candidate's handwriting, giving age, qualifications, brief outline of experience, &c., accompanied by copies of two recent testimonials as to ability and personal character, must be addressed to and reach me on or before Monday, 15th March, 1915.

G. SEVERN DONCASTER,
Surveyor to the Council.

Public Offices,
Hazel Grove,
Near Stockport.
March 1, 1915. (2,428)

COUNTY COUNCIL OF NOTTS.
APPOINTMENT OF COUNTY SURVEYOR.

The County Council of Notts are desirous of receiving applications for the office of County Surveyor. A statement of the duties will be supplied on application to me.

The salary will be £500 per annum, and, in addition, travelling expenses will be paid.

Applications, marked "County Surveyor," with copies of not more than three recent testimonials, must be made upon Forms, which will be forwarded by me upon receipt of an addressed foolscap envelope.

The applications must reach me not later than midday on Saturday, the 20th day of March, 1915.

Canvassing is strictly prohibited, and will be deemed a disqualification.

(By order)
H. HAMPTON COPNALL,
Clerk of the County Council.

Shire Hall,
Nottingham.
March, 1915. (2,433)

ASSISTANT ENGINEERS required by the Government of the Gold Coast for the Public Works Department for two tours of twelve months, with possible extension. Age 25-40. Salary £350-£10—£400. Furnished quarters and first-class passages. Two months leave in England on full salary. After each tour increased to four months, if returning. Candidates should be Associate Members of the Institution of Civil Engineers, or have obtained one of the University Degrees or other distinctions in Engineering which are recognised as equivalent to that examination, and possess a practical knowledge of surveying, levelling and estimating, particularly in regard to municipal work, including building construction. Apply by letter at once to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W. (2,422)

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. MARCH 12, 1915. No. 1,208.

Minutes of Proceedings.

Local Government Reform.

In the course of an address on Local Government Reform recently delivered to the members of the Municipal and County Club, Mr. Randolph Glen made some very interesting suggestions as to reforms in the law for doing away with certain anomalies in regard to drainage, highways, and appeals to Government departments. Dealing with drainage, Mr. Glen pointed out that the root of the trouble lay in the definition of drain and sewer, and expressed the opinion that the Legislature had put the cart before the horse in defining drain first and making everything else sewers. He suggested the following definitions: "Sewer" means (*a*) a pipe constructed by and at the expense of a local authority, or acquired by purchase, hire, or gift, or adopted with the consent, in writing, of the owner or majority of owners for the time being by a local authority, and used for conveying drainage of any kind from buildings or premises to a cesspool, or to another sewer, or to an outfall or disposal work; (*b*) a pipe constructed by a local authority or one or more private persons, or partly by a local authority and partly by one or more private persons, under a street in pursuance of a statute which, in relation to street works, enables the local authority to require the construction of such a pipe at the expense of one or more private persons; (*c*) a natural stream which receives drainage from one or more sewers, as hereinbefore defined, to an extent which, either alone or together with drainage from any other source, renders the stream substantially a mere conveyance of sewage, or a natural stream which has been adopted as a sewer by the local authority with the consent in writing of the owner or majority of owners for the time being of the stream. "Drain" means any pipe conveying such drainage as aforesaid, and not being a sewer as hereinbefore defined, or any drainage pipe which by agreement in writing entered into at the time of its construction and made between the owner or owners and the local authority is to be treated as a drain and not a sewer. Mr. Glen further proposed that any owner or the majority of owners of a drainage pipe should be empowered at any time to apply to the Local Government Board for authority on proof to the satisfaction of the board of its public utility.

In regard to highway law, Mr. Glen proposed, in the first place, to make actual enjoyment by the public for twenty years presumptive evidence of intention to dedicate. This presumption, however, should be rebuttable by showing that land has been in strict settlement, except that actual [illegible] evidence of dedication, in the absence of clear evidence of an intention not to dedicate. He [illegible] Private Street Works Act, 1892, of universal application, abolishing the distinction between "new" and "old" streets in London. The suggested modifications were: (*a*) That the cost of making up roads partly repairable by the inhabitants at large should be shared equally by owners and local authority; (*b*) that exempted properties (of railways, incumbents, &c.) should pay half what they would have to pay if not exempt, the other half to be paid by the local authority; (*c*) that an objection that a frontager is not the "owner" of property in respect of which he is charged should be allowed to be taken at any time. Mr. Glen also proposed to give owners power to apply to the Local Government Board for order making a non-repairable highway repairable by the local authority on proof to the satisfaction of the board of its public utility. Regarding appeals to Government departments, Mr. Glen's method of overcoming the growing dissatisfaction with the determination of such appeals was to allow appeals from all such departmental decisions to a new expert tribunal with similar constitution to that of the London Tribunal of Appeal. The proposed tribunal should consist of a lawyer as chairman, with one member a surveyor and another an accountant or architect, according to the nature of the case; and would sit where the case before it has arisen, if it considers this advisable, in order to save expense. While we do not agree with all that Mr. Glen proposes, his suggestions are certainly worthy of careful examination by those who have to grapple with the problems involved, and we hope to return to the matter in a future issue.

The "Single Private Drain" Problem.

We have never been able to understand on what principle the provisions of sec. 19 of the Public Health Acts Amendment Act, 1890, were restricted to the case of houses belonging to different owners. The framers of sec. 49 of the Kingston-upon-Hull Corporation Act, 1903, evidently failed to appreciate the restriction, that section being similar to sec. 19 of the public Act, with the important variation that it applies in every case where two or more houses are connected with a public sewer by a single private drain, whether the houses belong to different owners or to a single owner. So far so good; but the local Act still leaves room for controversy on the vexed question "What is a 'single private drain'?" In the recent case of *Kingston-upon-Hull Corporation* v. *North-Eastern Railway Company*, Mr. Justice Sargant was called upon to decide such a controversy with respect to a combined drain connecting thirty houses belonging to the railway company with a public sewer. The houses abutted on a cul-de-sac, ten being situated on one side of the road and twenty on the other side. The closet accommodation formerly consisted of earth-closets, and prior to 1876 all other drainage was discharged into an open ditch. In that year the corporation, purporting to act under sec. 23 of the Public Health Act, 1875, required the company to make a drain connected with the public sewer in the adjacent highway. The combined drain in question was accordingly constructed. In 1911 a nuisance arose in the drain, and the corporation gave notice to the railway company, under sec. 41 of the Act of 1875, to execute certain repairs. The notice not having been complied with, the corporation did the work themselves, and in this action sought to recover the cost from the company, whose liability, of course, turned upon the question whether or not this was a "single private drain." Mr. Justice Sargant held that it was. In his view the meaning of the section (of the local Act) was that where the drainage pipe provided in connection for a group of houses was as exclusive and private in relation to those properties as the statutorily defined "drain" was in relation to the single house which it served, then the liability of the owners for nuisance arising from that common drainage was analagous to, or corresponded with, the liability of the owner of a single house for the drain serving that house only.

If we may say so with respect, this view seems [illegible] but not unreasonably expressed. Whether it is reconcilable with the *dicta* of the House of Lords in *Wood Green Urban District Council* v. *Joseph* (1907, 1 K.B., 182) is another question. It will be remembered that in that case the learned law lords expressed the opinion that sec. 19 of the Act of 1890 only relates to conduits which owners can be compelled to [illegible] The difficulties attendant upon this interpretation were discussed at some length in our issue of November 27, 1908 (at p. 565), and it appears [illegible] It was, indeed, one of the arguments used by the company's counsel in that case that the corporation could not have compelled the construction of the combined drain because most of the houses were more than 100 ft. distant from the public sewer. We should have thought that this was clearly the case, even apart from the question of the distance of the sewer. It is true that under sec. 23 the local authority can recover the cost of constructing a new sewer from the owners of two or more houses where such cost would be less than that of connecting the houses with an existing sewer. But, so far as we are aware, it has never been contended that this would enable them to require the owners themselves to construct a combined drain which is not to have the status of a sewer. Having regard to the difficulties surrounding this subject, accentuated as they are by the decision in the Wood Green case, we should not be surprised if the decision in the Kingston-upon-Hull case were the subject of an appeal.

* * *

Superannuation at Islington.

The anomalous condition of the existing law as to the granting of superannuation allowances to officers of local authorities has frequently been pointed out in these columns. Certain classes of officers—notably those in the Poor-law service—are entitled to pensions on a scale practically equivalent to that which obtains in the Civil Service; in the Metropolis the Superannuation (Metropolis) Act, 1866 empowers those authorities to which it applies to grant limited superannuation allowances in certain cases; some local authorities have obtained special Parliamentary sanction to schemes for a particular locality; while in the vast majority of cases the power to grant pensions to municipal officers is still entirely wanting. Last year the Islington Borough Council appointed a special committee to consider the question of superannuation in that borough, and the committee have just issued a very interesting report, relating more particularly to the position of the workmen employed by the council. It appears that prior to 1911 certain allowances had been made under the name of "extended sick pay." In that year, however, the auditor expressed the opinion that these payments were illegal as being in fact pensions, although given under the name of sick pay. The council therefore decided for the future to conform to the provisions of the Superannuation (Metropolis) Act, 1866, in all cases. Under this Act, the public authorities to which it applies are given a discretion to grant a superannuation allowance to those who have been in their employment in an established capacity for the prescribed period, on their becoming incapacitated from further service, but the allowance must not exceed the maximum scale prescribed by the Act. It appears that for some time the council have been acting on the assumption that every allowance granted must be on the maximum scale. They have now been advised, however, that this is not the case; and the effect of the recommendations contained in the committee's report is that the council should continue to work under the Act of 1866, and consider each application from either officer or workman on its merits; but that in fixing the amount of the allowance of men entitled to disablement benefit under the National Insurance Act or to old age pensions, the sum granted should be so restricted as not to disentitle the applicant to his State allowance. The Islington report appears to be sound as far as it goes; but we have never regarded the Act of 1866 as satisfactory, inasmuch as it leaves everything to the whim of the council in any particular case. It is to be hoped that the [illegible] pensions of municipal officers and employees may soon be [illegible] by the passing of a comprehensive measure dealing with the whole question.

The London County Council and their Staff.

The General Purposes Committee of the London County Council have recently had under consideration certain representations [illegible] matters affecting the central administrative staff put forward jointly by the Council Staff Association and the National Union of Clerks. The represen-

tations were accompanied by a request for the reception of a joint deputation, accompanied by the secretary of the union. The committee have accordingly been obliged to consider the principle involved in the request that the central administrative staff may be represented before committees of the council by persons not in the service, and they have arrived at the following conclusions: (1) The council and its committees are represented so fully with the exceptional character of the work done, and, in a general way, with the capabilities of the chief of the central administrative staff doing it, that no other body can be so well acquainted, as they are with the requirements of and the best mode to the central staff. (2) The central administrative staff have entered the council's service either by examination or by special advertisement for technical and professional appointments. They are appointed under conditions laid down by the council, which conditions are known to the candidates before entering the service. (3) The selection of a competent administrative staff is one of the most important functions of a governing authority, and depends upon considerations entirely outside the experience of an outside organisation. (4) Every member of the staff is appointed by the council as an officer of the council, and can be dealt with in any material way, either of advancement or retrogression, only by the council, while the discipline of the staff is entrusted to the head of each department. The intervention of an outside organisation would therefore undesirable and unnecessary. (5) The council's system of dealing with its staff is individualistic and based upon the recognition of personal merit, and a distinctive feature of it is that officers in the classified staff are selected to fill some of the higher positions. (6) An association dealing with members of the central administrative staff might seek to exercise influence at elections on questions affecting the staff, and this would in effect transfer from the council matters which can only be effectively dealt with in the light of a knowledge of all the facts. The committee accordingly recommend that a standing order be passed to provide that the intervention of persons not in the service of the council between the council and officers of the central administrative staff other than the minor establishment shall not be permitted. Inasmuch as we understand that representatives of the administrative staff at present have opportunities of placing their views before committees, the recommendation of the General Purposes Committee has, in our view, some justification.

* * *

Local Authorities' Expenditure.

It was reported to the London County Council on Tuesday that the Treasury, having had before them applications for their approval of loans by the county council to the Battersea, Hammersmith, Lambeth, and Wandsworth Borough Councils for the carrying out of electricity, paving and street improvement works, and the provision of sanitary conveniences, express the opinion that capital expenditure by local authorities in the United Kingdom should be restricted within the narrowest possible limits at the present time. Treasury approval, the council are reminded, is now required for all fresh borrowings by local authorities, and it has been intimated to several bodies, in reply to applications, that approval will not be forthcoming in the absence of special considerations for fresh borrowings for the purpose of new expenditure. In the circumstances the Treasury ask that the applications now in question which involve a total outlay of £24,600—may be reconsidered accordingly. As the Finance Committee of the County Council point out in their observations upon the communication, the Government attitude has an important bearing upon the action of the council in regard to its own capital expenditure and its position as a loan-sanctioning authority, as well as upon its action in lending money to metropolitan borough councils and certain other local authorities in London. They are, however, in communication with the Treasury in order to obtain a clear understanding as to their views in regard to the policy which the council should adopt, and they promise to report again after a reply has been received. In the meantime they are withholding from the council the submission of recommendations as to the sanctioning of borrowings by metropolitan borough councils, and they have communicated the terms of the Treasury's intimation to the various committees of the council. They have also abstained from making any further advances of money to local authorities, and have given instructions for the postponement of the completion of any loans which have already been agreed to. In the prevailing circumstances, we imagine that there will be little disposition to criticise the action of the Treasury. In view of the magnitude of the task which lies before the country, every possible and reasonable economy must and ought to be exercised, and it necessarily follows that loans to local authorities must for the present be kept at a minimum.

* * *

A "Sewage-soaked" Welsh Parish.

The motto "Business as usual" points obviously to a worthy objective, and at no time can it be more essential than so far as it affects public health through the agency of sanitation. Dr. T. W. Jones, medical officer of the district of Wrexham, has emphasised its utility by the report which he has written on the housing conditions of Broughton, East Denbighshire, and which was published last week. He gives therein the result of a detailed examination of 1,431 working class houses, and it must be conceded that the picture he has drawn presents many very shocking features. In Moss and Cerney the houses are built on a steep slope, and many of them, on one or more sides, lie deeply against the earth. Some are imbedded up to the eaves on one side, while others are similarly placed to the extent of several feet. Dampness ensues as a matter of course, and when, as is too often the case, this is accompanied by insufficient provision for lighting and ventilation, the result is a rich harvest of chest troubles, tuberculosis, and rheumatism. Tottering houses, due to the subsidence of the foundations, consequent upon colliery workings near to the surface, are plentiful, and in many instances they have been abandoned. In other places the disturbance of the ground has interfered with the cesspools by closing up cracks in the rock underneath, through which the sewage at one time had percolated. The backs of numbers of these houses as a result are being constantly flooded with sewage. The present system of cesspools in Broughton is severely criticised by Dr. Jones. In 141 houses no provision at all has been made for drainage, while in 81 others the arrangements made are far from satisfactory. "When it is borne in mind," he writes, "that the great majority of the cesspools are not constructed on the principles now laid down in the bye-laws, but on the soak-away method, it will be realised that the village is soaked with sewage." Obviously a system of sewerage is called for in certain of the districts dealt with by Dr. Jones, and it is to be hoped that the special committee to which his report has been referred will, by insisting upon a suitable remedy, rescue this part of East Denbighshire from a most unwholesome and scandalous condition.

D

The Drainage of Hamilton, Bermuda.*

By G. BERTRAM KERSHAW, M.Am.Soc.C.E., M.Inst.C.E., Late Engineer to the Royal Commission on Sewage Disposal.

The events leading up to the adoption of a new sewerage system for Hamilton may be briefly summarised as follows: The increasing number of visitors from New York and elsewhere to Bermuda caused a marked change in the sanitary conditions obtaining in several of the communities, especially in the town of Hamilton.

It soon became evident that the cesspool system was rapidly becoming overworked, owing to the larger quantity of water used. In many cases overflows occurred, polluting the surface soil; further, some of the smaller hotels, in order to supplement their tank water supply, used well water for baths and flushing purposes. Nearly all these well waters in the town are more or less polluted. In 1910 matters came to a head, and the corporation retained the services of the writer to investigate matters and to report on the best method of dealing with the sewage disposal of the residential portion of Hamilton. These investigations comprised a thorough survey of the town of Hamilton and its environment, the selection of a route for pumping main and outfall sewer, the examination of Hamilton Harbour and the north and south shores, together with float experiments and various other matters. The outfall sewer from Prospect Camp was also visited.

There are no 25-in. ordnance sheets of Bermuda; consequently, enlargements were made of Lieutenant Savage's 6-in. survey. Several fresh surveys of portions of Hamilton and the vicinity were needed owing to alterations carried out subsequently to the original survey.

With respect to the existing cesspool system, it was found that the liquid from the cesspools had percolated through the limestone to the subsoil water—which lies on a sub-stratum of salt water—and had polluted it.

The purification which the liquid from a cesspool undergoes—in addition to the mere straining-out of solids—must depend upon its receiving sufficient oxygen for the oxidation of the organic matter and ammonia present through the agency of aërobic bacteria.

The level of the water-table underlying Hamilton was found by measurement to rise and fall with the tide, and it is possible in some wells to draw comparatively fresh water from the surface and salt water from the bottom of the wells.

It was pointed out to the local Board of Health that no sewerage system for Hamilton could be regarded as complete, or even satisfactory, unless, while meeting the more urgent and present needs, it also included provision for future extension, so as to include the whole of the city area. . . .

The sewerage scheme was drawn up on this understanding, and divided into two sections: (1) A sectional scheme, dealing with the area lying mainly south of Church-street, and (2) a sectional scheme auxiliary to this, serving the northern area, which could easily be carried out at a later date. It was found that a gravitation scheme throughout was impracticable, but that all the southern area, with the exception of the Princess Hotel, could be served by sewers gravitating to a pumping station placed on the harbour front, while the northern area could be gravitated to a small auxiliary pumping station on a plot of ground north of the Hamilton Hotel, the sewage to be raised on the completion of the scheme to the manhole adjoining the Hamilton Hotel.

Regarding the prospective quantity of sewage to be dealt with, it was found that, allowing for future increase in population and visitors, a total dry-weather volume of sewage of some 150,000 gallons might be anticipated every twenty-four hours.

Special emphasis was laid upon the necessity of ample and frequent flushing, and for this purpose it was proposed to utilise sea water pumped from the harbour to a storage tank placed on high ground to the north-west of the town. It was evident throughout the investigation that any question of discharging sewage into Hamilton Harbour was absolutely out of the question. Such a course would, with the high temperatures obtaining—both as regards atmosphere and sea water—together with the presence of *ulva*, have been productive of an intolerable nuisance.

Examination of the north shore showed it to be unsuitable for the discharge of sewage other than in very small quantities owing to the slackness of the currents and their direction. Moreover, the height to which the sewage would have required pumping would have been very considerable. The south shore, on the contrary, was well adapted for the discharge of sewage. The water in the vicinity of Hungry Bay was deep fairly close in to the shore, there was a considerable swell, even on a calm day, and it would have been practically impossible for *ulva* to have established itself there. The most suitable position for the outfall was found to be a point just west of Hungry Bay, and a series of float experiments carried out prior to my arrival, in conjunction with experiments made by myself during southerly and south-westerly winds, showed that the set of the current on the south shore was eastward during flood tides, while during ebb tides it was westward. It was further found that the small headland at the mouth of Hungry Bay had the effect of deflecting the flood-tide current seaward, clear of the bay.

This outfall site possessed the additional advantage that at a short distance from the cliff there was an excellent site for tanks, with ample fall, which could be utilised, if in the future, owing to an abnormal increase in population, or some other unforeseen circumstance, it should become desirable to treat the sewage before discharge. The best site for the pumping station was found to be almost at the edge of the harbour. Owing to prospective extensions of wharves the available site was very restricted, and just before the work was put in hand the site was moved some 30 ft. to the east to make room for wharfage and buildings.

The selection of the route for the pumping main and outfall sewer was a matter of considerable difficulty, owing to the very hilly and uneven character of the country, and also because it was necessary to reduce the cutting as far as possible—all of it being in rock—and to carry the pumping main from the pumping station to the summit of the outfall sewer in such a manner as to avoid possibility of airlocks.

The report was submitted, and the vote in favour of its adoption was unanimous, the corporation deciding to carry out the work themselves without contractors, while retaining the writer to prepare the necessary drawings and to supervise the carrying out of the work.

All the materials used in the work were manufactured in and sent out from this country.

Mr. J. H. Dale, formerly of the Royal Engineers, was appointed resident engineer, and the actual work was commenced in 1912.

SEWERS.

These were constructed of best quality socketed salt-glazed stoneware pipes, of diameters ranging from 7 in. to 12 in., and were manufactured by Messrs. Doulton & Co.

All excavation was in the limestone rock, and was carried out with picks, mattocks and wedges, with occasional blasting. The sewers were bedded on the rock, recesses being cut for the sockets, the pipes being packed up and surrounded with fine material before filling was commenced. Where the ground was bad the pipes were surrounded with fine concrete. Special care was taken in filling the trenches to keep the larger fragments of rocks at or near the surface of the trenches.

All the sewers have good grades, the following being minima for each diameter of pipe: 7-in., 1 in 190; 9-in., 1 in 59; 12-in., 1 in 359.

MANHOLES.

The construction of the manholes and flushing tanks varied according to circumstances. Where good solid rock was encountered this was utilised to form a portion of the manhole walls, the sections opened out by the sewer trenches being walled in with masonry and the whole of the interior of the manholes rendered.

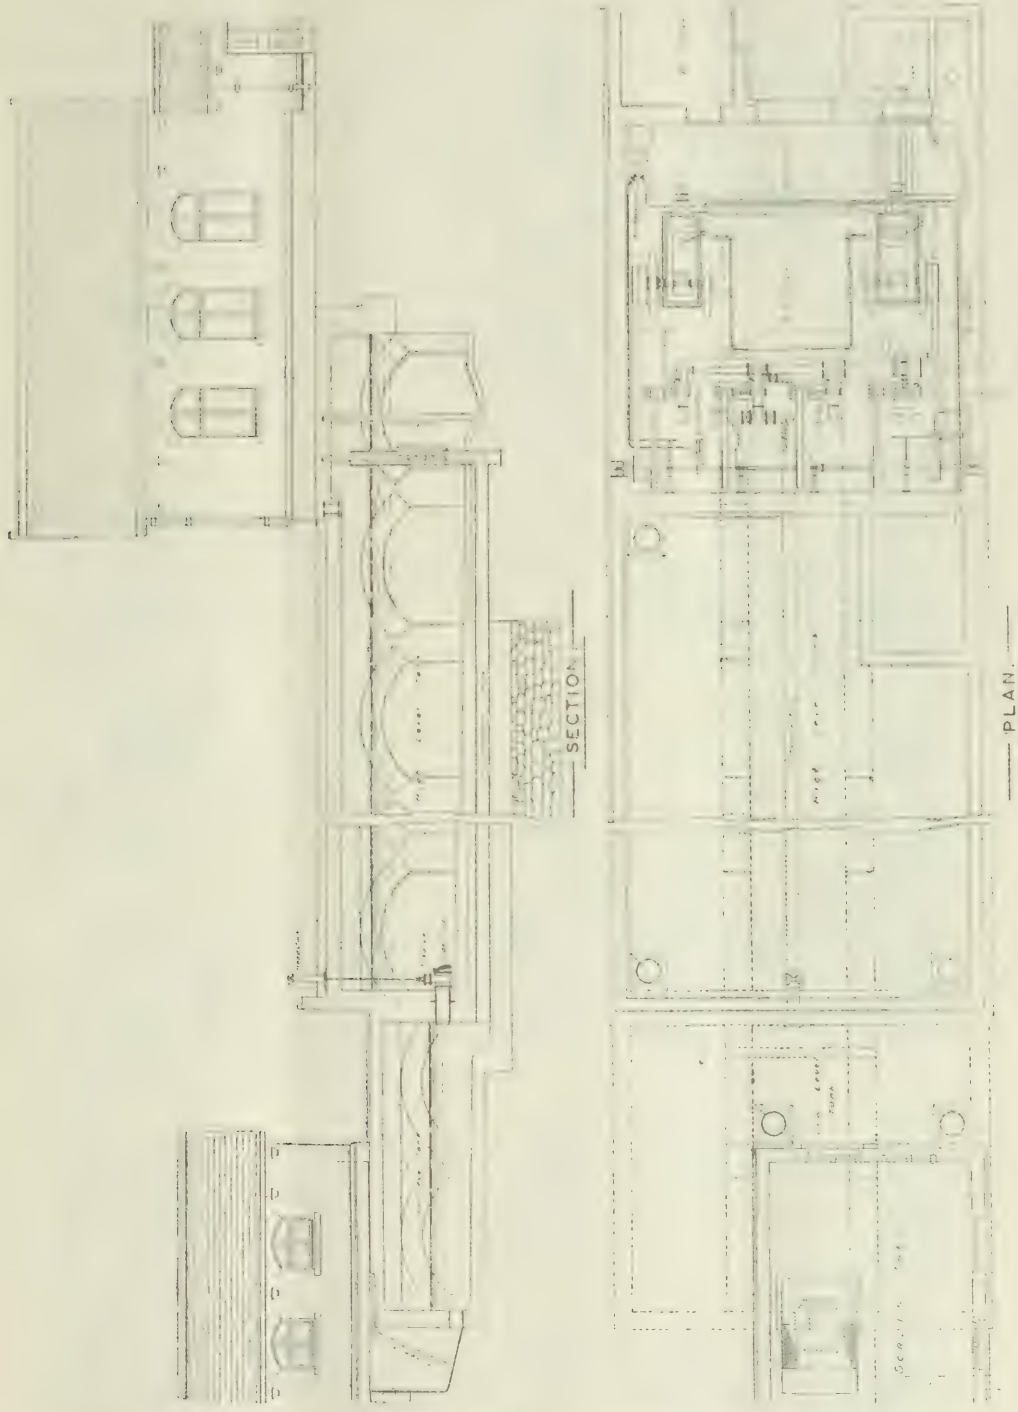
When bad ground or sand pockets were met with, the manhole was either constructed entirely of con-

* From a paper read at the last meeting of the Institute of Sanitary Engineers.

side or manner, or alternatively the bad portions were cut out and made good with cement concrete. Reinforced concrete slabs were used in lieu of the usual Yorkshire flag coverings.

heavily gravelled. The whole of the ironwork was supplied by Messrs. Ham, Baker & Co.

Four hundred and ten automatic flush tanks were provided to all dead ends of sewers, and were made



SECTION
PLAN.
J. A. F. HAMILTON, SEWERAGE ENGINEER. SECTION & PLAN OF AUTOMATIC FLUSHING TANK.
G. Bertram Kershaw, M.Inst.C.E., M.Inst.S.E., Engineer.

The manhole covers used were of the heavy pattern "ventomot," with 22-in. opening in the clear, without wood blocks, and provided with stout galvanised dirt boxes. The foot irons were of malleable iron,

any to ensure heavy and frequent flushing. These tanks are fed by 3-in. diameter branches from a 2-in. cast-iron main, connected up to a storage tank placed on high ground. Sea water is used for flushing pur-

H. Bertram Kershaw, M.A.M.Soc.C.E., M.Inst.C.E., Engineer.

pose being pumped up to the storage tank by a small twin centrifugal pump at the pumping station. The storage tank is provided with a by-pass valve, so that the pump may discharge direct into the sea, and it has a capacity of about 7,000 gallons. The flushing tank is constructed of reinforced concrete, and is connected to both sewers by means of 6-in. cast-iron pipes with valves at the storage tank.

Disc penstocks are provided in certain manholes to facilitate flushing in either direction.

Ventilation of the sewers is effected by means of ventilating columns, 25 ft. in height, placed at the highest points of each sewer. The shafts are 6 in. in diameter, galvanised, and stand on cast-iron bases 4 ft. high. They are provided with rust pockets, screw caps, and wire cages.

Surface water is carefully excluded from the sewers, and there are no storm overflows. Water is a valuable commodity in Bermuda, and steps are taken to conserve it in every possible way.

Before the sewage enters the suction tank it passes through a covered-in screen house, provided with a hand-raked screen set at an angle of about 30° with the vertical, the bars having ¼-in. spaces between them. The screenings are removed from the screen several times daily by hand raking.

SUCTION TANK.

The suction tank has been excavated in the limestone rock, and owing to the presence of soft pockets and the fact that a portion of the work to be carried out was below the level of the sea, great difficulty was experienced in keeping out the sea water. Further, gelatinous silicates were formed by the action of the sea water on the cement mixed with the concrete to fill the sand pockets. All the smaller pockets were dealt with separately, but with two very large pockets occurring near the centre line of the tank, a special type of trench was made, and an 8-in. centrifugal pump installed over the pocket, but failed to keep the water down.

Eventually it was decided to divide the tank into two sections, by means of the dividing wall, which was in position when the work was started, the tide level, but raising the floor of the remainder of the tank about 12 in., and extending it slightly eastwards to equalise the tank capacity, and thus balance the weight of the concrete and bring the tank on to solid ground. Further, two steel girders encased in fine concrete were placed across the west wall of the upper tank to take the weight of the pump foundations. The large sand pocket was excavated to a depth of about 4 ft. and packed with bags of fine concrete, well keyed under the side walls of the tank, hand-packed rubble being well rammed in 3-in. layers over the whole of the tank floor. A reinforced concrete floor 12 in. in thickness was placed over the rubble. The work was carried out in sections, and proved a lengthy undertaking. The reinforcement was introduced owing to the risk of fracture by earth tremors or salutes from gun firing coinciding with a period of high tide. It consisted of ½-in. iron rods laid both longitudinally and transversely to 12-in. centres, 3 in. from the underside of the concrete flooring, with the ends bent over and well embedded in the concrete at the sides of the tank, while a layer of expanded metal 3-in. mesh by ½-in. by 3 gauge was laid 3 in. beneath the surface of the concrete floor. The walls of the tank were formed partly in concrete and partly in solid rock, all the interior of the tank being rendered.

The piers and arches were formed of concrete.

The alteration to the tank necessitated laying a 12-in. pipe under the larger tank to the first compartment, terminating in a stand-pipe. A 12-in. pipe furnished with a tide flap and sluice valve was also built through the partition wall dividing the two tanks, and water-level indicators were provided in each tank compartment. The total combined capacity of the two tanks is about 90,000 gallons.

Pumping is carried out at present on the ebb tide only. When the water level in both tanks reaches 3·75 ft. above ordnance datum, the sluice valve connecting the two to the high-level tanks is closed and the contents of the low-level tank pumped into the high-level tank by one of the 4-in. sewage pumps. At the proper time, regulated by the state of the tide, the sluice valve on the pump delivery to the suction tank is closed, the valve to the pumping main opened and the sewage pumped to the outfall. The suction tank is swept down at least once every week, and all accumulated silt pumped to the outfall.

OIL ENGINES AND PUMPS—MACHINERY.

The question of utilising electrical power for pumping was fully gone into before deciding upon oil engines, and it was found that the balance as regards running cost and reliability was greatly in favour of the adoption of oil engines.

The engines are in duplicate, Messrs. Ruston & Proctor & Co.'s refined-oil engines being used. They are capable of developing 28-b.h.p. constant working load, with 31-b.h.p. maximum load, and will burn either crude or refined oil. Each engine is amply powerful enough to drive any two of the sewage pumps, or one sewage pump and the salt-water pump.

The countershafting consists of 2¼-in. diameter mild steel, with collars and coupling, supported by wall boxes and three wall brackets and bearings. This shaft takes two pairs of fast and loose pulleys to take the main drive from the engine, three pulleys to take the drive to the sewage pumps, one pulley to take the drive to the salt-water pump, and pulleys for the circulating pump and air compressor. A self-starter and a charging pump common to both engines are provided, and an extra large cooling water tank with circulating piping to the engines, together with circulating pump driven from the line of shafting.

The pumping machinery consists of three 4-in. centrifugal pumps, each capable of delivering 300 gallons of sewage per minute against a total head of 75 ft. including friction, and each complete with fast and loose pulleys, striking gear, rotary exhauster, sluice valves and suction and delivery pipes and bends. The salt-water pump supplying the storage flush tank is a 2½-in. twin centrifugal pump capable of lifting up to 120 gallons per minute of salt water against a total head of 120 ft.

RISING MAIN.

The rising main from the pumping station is of cast-iron pipes 10 in. in diameter. As showing the nature of the ground through which this main had to be carried, it may be mentioned that at one point it is recessed into the face of a disused quarry. Lead wool was used for jointing the pipes, and it was found satisfactory in all respects. In one place where "made" ground occurred for a distance of about 120 ft., sinkings were made down to the solid rock and the pipes were supported upon concrete piers. The main was tested to a head of 150 ft. (65 lb. per square inch), the pressure being maintained for fifteen minutes.

SEA OUTFALL.

The outfall down the cliff into the sea is formed of ball-and-socket pipes, and these extend seawards for some 40 yds. from the cliff face. They were laid in a channel formed in the solid rock floor by blasting, and were packed with bags of 1 to 1 cement concrete, laid as far as possible level with the natural surface of the rock. The pipes, where exposed to the sea water, were treated by the Bower-Barff process as a protection. The precise position behind the protecting reef was chosen by reason of the fact that sand was never observed to lie there. Moreover, the reef has the effect of partially checking the velocity of the heavy bodies of water which dash against and over the cliff during gales. The end of the outfall pipes is covered by about 4 ft. of water at lowest tides.

COST.

The total estimated cost of the work was between £12,000 and £13,000. The final cost cannot yet be given, but there are good reasons for believing that the actual cost will be slightly under the estimate.

Although all the house connections have not yet been entirely completed, the pumping machinery has now been in use for some months, and has gone perfectly smoothly. Tests have been carried out since the works were completed by means of dyes placed in the suction tank, and they have confirmed the results of the float experiments, the sewage keeping well out from shore, even with heavy southerly winds.

The Progress of Cremation.—The annual report of the council of the Cremation Society of England states that the number of cremations at Woking during 1914 was 124, as compared with 128 in the previous year, while the figures for Golder's Green are 671 and 602 respectively. Thus the total cremations in 1914 amounted to 795, as against 730 during 1913—a growth of 9 per cent. The corresponding statistics for Great Britain are 1,189 and 1,279—showing an increased percentage of 8·9.

Some Notes on Wind Pressure.*

By R. GRAHAM KEEVIL, A.M.I.MECH.E., M.C.I., Works Department, Admiralty,
Lecturer on Ferro-Concrete at the Northern Polytechnic.

It may be said that our modern knowledge of wind pressure extends backwards only so far as the destruction of the original Tay Bridge in 1879. This bridge was part of the scheme for bridging the two firths—Forth and Tay—which was brought to a successful completion by the construction of a new Tay Bridge and the erection of the Forth Bridge; the latter, by the way, has been opened for traffic for twenty-five years to-day.

On December 28, 1879, while a train was on the bridge and a "gale of exceptional severity was blowing," one or more of the piers gave way, bringing down eleven 245-ft. span and 227-ft. span girders, precipitating the train and seventy-four people into the Tay. The subsequent Board of Trade inquiry showed that opinion among engineers about wind pressure was in a state of chaos. An endeavour was at once made by a Board of Trade Committee to put matters on a satisfactory footing. After examining wind records, they, on May 20, 1881, recommended: "That for railway bridges or viaducts a maximum wind pressure of 56 lb. per square foot should be assumed for the purpose of calculation." This immediately came into force for railway work, and was also adopted generally for structures on public works, although such adoption was purely arbitrary, or specified in local by-laws.

Much opposition was raised to this standard of pressure, because it was considered excessive and not justified by experience of existing structures. As far as buildings are concerned, the horizontal pressure assumed for designing has gradually been reduced to the 30 lb. per square foot, now often taken.

QUESTIONS OF IMPORTANCE.

Two questions of great importance arose, and these have since been practically settled by research—viz.:—

(*a*) Where the wind velocities given by the anemometers then in use correct?

(*b*) What was the relation of wind velocity to wind pressure?

There are three methods for the measurement of wind:—

(1) Velocity measured by the Robinson anemometer.

(2) Pressure measured by a pressure tube anemometer.

(3) Pressure measured by a plate or board set face to the wind.

Considering (1), the anemometer that bears his name was invented by Dr. Robinson in 1846, and is by far the most used of the various instruments which have been produced from time to time. It consists of four arms at right angles; at the end of each arm is a hemispherical cup. This instrument measures direct velocity, and Dr. Robinson, after experimenting, stated that the velocity of the cups was one-third the velocity of wind for all instruments, whatever their size. This is now known to be a fallacy, with the result that practically all records prior to 1902 were incorrect and generally much too high, a fact which justifies the distrust shown by the experts at the Tay Bridge inquiry respecting the records quoted then.

The discovery that the factor 3 for the Robinson anemometer was incorrect is due to the experiments carried out by Mr. Dines, and since confirmed by other authorities. These experiments consisted of placing anemometers on horizontal arms, which were rotated by means of a steam engine; 14½ revolutions of this "whirler" constituted half a mile of space, while great care was taken to ensure accuracy in the results. The number of turns of the whirler and the revolutions of the anemometer, both of which were counted automatically, determined the relation between the distance travelled and the revolutions of the anemometers, and thus the value of the new factor 2·2 was obtained.

The outcome was that the Wind Force Committee of the Royal Meteorological Society in 1902 adopted the factor 2·2 instead of 3 for the standard Robinson anemometer. Thus, when the old factor was used, and the instrument indicated, say, a velocity of 60 miles per hour, the use of the new factor reduced the velocity to 44 miles per hour. Converting these velocities into pressures by the formula $P = 0{\cdot}003\,V^2$, the 60 miles per hour velocity gives 10·8 lb. per square foot, while the velocity of 44 miles per hour gives a pressure of 5·8 lb. per square foot—a very serious alteration, which doubtless explains the fact that chimneys, buildings and bridges which by all the rules of the anemometers should have fallen down are standing until to-day, or meeting an honourable end by the hand of housebreakers. This rotating anemometer has one great disadvantage in that, owing to the inertia of the instrument, it does not record gusts of wind which may have a much greater velocity than the average values shown by this instrument. For instance, if the record is, say, 37 miles per hour, it shows that the cups have passed through a distance of 37 miles in the hour; at some part of the time they would be revolving faster than at others, but the record shows the average speed.

Another type of instrument is the pressure tube anemometer invented by Mr. Dines. This instrument automatically records all the varying pressures of the wind, and consequently all gusts and lulls that occur during a gale, whatever the velocity of the wind may be. The principles upon which the design of this instrument is based are that when the wind blows into the open horizontal mouth of a tube it causes an increase of pressure within it and in all airtight arrangements connected with it. On the contrary, if the wind blows horizontally across the open mouth of the vertical tube, the column of air within the tube rises and the pressure is reduced within it and in all airtight arrangements connected within it.

The third type of anemometer is like the second type, a pressure recorder, and is in general use, although now practically obsolete. This type consists of a board or plate which, by means of a weather vane, is kept facing the wind. The back of the board is fitted with springs, which keep the board up to its work. The wind acting on the face of the board drives it backwards, compressing the springs; the pressure is then measured and recorded automatically by the movement of the board or the compression of the springs. This type of instrument has been in use for many years, and, like the Robinson anemometer, the earlier forms recorded pressures which are now known to be erroneous and much too high. The cause of the high pressures recorded up to 60 lb per square foot and over was faulty design and the momentum of the moving parts. The result has been that high pressures have been recorded and quoted by authorities, when as a matter of fact the actual pressure was something less than half those shown.

FORTH BRIDGE EXPERIMENTS.

This type of pressure board was used at the Forth Bridge during its construction. When Sir Benjamin Baker, in connection with Sir John Fowler, undertook the responsibility for this great structure, it became necessary to ascertain as nearly as possible what would be the probable wind pressure on the bridge in the exposed position on which it is sited. He accordingly erected on the top of the Old Castle on Inchgarvie three anemometers; the principal one was 20 ft. long by 15 ft. high, approximately the size of the side of a railway carriage of those days, erected vertically with its surfaces facing east and west, this direction being the most unfavourable from which the wind could strike the bridge. The board was hung in a frame and fitted with four springs at the four corners to adjust the board to its normal position. The movement of the board was communicated to the registering apparatus by means of wires. In order to ascertain to some extent the effect of small local gusts, plates 18 in. in diameter were fitted in holes cut out of the centre of the board, and at the top right-hand corner, and arrangements made to register the pressure on them separately. A circular plate with an area of 1½ sq. ft. was erected to face in the same direction, and 8 ft. away from the large board, and provided with means for registering the pressure. The third was a revolving gauge, also with an area of 1½ sq. ft., and fitted with a vane so that it always faced the wind.

* Abstract of paper read at the last meeting of the Concrete Institute.

These anemometers, although giving good results, were not intended to give very accurate results. The records of the violent gales showed that the average on the large board was 0·565 of the average on the small gauge, and that the average on the large board was 0·592 of the average on the revolving gauge. If we round these figures up we can say that the pressure on the large board is five-eighths the amount shown by the small gauges, a fact to be remembered when considering the records from the small anemometers in general use, and applying them in design of buildings of large exposed area.

After the completion of the bridge five revolving gauges with a plate area of 1½ sq. ft. were fixed on the bridge, and a continuous record was obtained.

These results from the Forth Bridge are interesting and valuable in that they show records of an exposed position and at considerable differences in height and width. From a consideration of them with other reliable information now available, they appear to be high in value, and to be influenced by gusts and possibly by some momentum of the plates of the anemometers.

The most valuable information available respecting wind velocities is undoubtedly that given by Dr. Shaw in his report on the Beaufort scale of wind force, which is compiled from the records of the anemometers at various meteorological stations. This information shows the number of miles of wind exceeding 37 statute miles in the hour, grouped according to the maximum hourly velocities recorded by Robinson anemometers. The point that is most striking after a study of the records is that pressures over about 12 lb. per square foot are rare. It must be borne in mind that these records are averages, and that individual gusts would give higher pressures on small areas.

Dr. Shaw, in his reports and memoranda, No. 9 compiled in connection with the Advisory Committee for Aeronautics, defines "the ordinary 'gustiness' of a steady wind" as the "variation of the velocity and direction of the wind, while the average hourly velocity remains practically unchanged, or increases or decreases gradually. The intervals of these gusts are of the order of some fraction of a minute; they are largely a question of exposure of the anemometer."

COAST AND INLAND WINDS.

The relation between coast and inland wind is a practical question which often arises when an important structure is to be designed in some locality where building regulations are of an elementary character, or non-existent, and where the only guide is the possession of reliable information, such as that already quoted, but which has been taken at one or more exposed stations near the coast while the proposed structure may be sited some distance inland. Dr. Shaw says that, "speaking from the daily experience of weather maps, we may say that a westerly wind of force 8 at an exposed western station will be represented at an inland or east coast station by a wind force of 5. The corresponding reduction in velocity is from 42 to 21 miles per hour. Provisionally, therefore, we may say that the surface wind velocity (that is, winds that will affect a structure) at a reasonable well-exposed station inland, or at a coast station for an off-shore wind, is reduced to one-half the velocity of an open coast station. As pressure is dependent on velocity, it follows that the pressure will be reduced to a corresponding amount.

When dealing with a building of large exposed area there is often a difference of opinion, in the absence of regulations, as to what wind pressure to adopt—i.e., the maximum average velocity or the greatest gust. There is little available information as to what may be termed the area of a gust, but it is considered to be comparatively small. In a well-designed and well-constructed structure, it would appear to be good enough to take the maximum velocity, and trust to the continuity of the structure to distribute local gusts.

The presence of windward and leeward pressures on experimental boards and structures has been known for many years, and many experimenters and writers have dealt with it. The windward pressure is, of course, caused by the wind striking on a surface exposed to it. The leeward pressure appears to be caused by the flow of air round the edges of the obstacle, tending to draw some of the still air behind with it, and causing a partial vacuum. The direct pressure and the suction of the vacuum must be added together in order to arrive at what is known as the total pressure. Up to the present, assumed wind pressures, which are undoubtedly excessive, have been in general use for designing, and very safe structures have been the outcome; but with the advance of knowledge, the very heavy structures now common will gradually give place to more scientific designs, and a corresponding saving of material. New methods now being evolved will then become of the greatest importance.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it not [illegible] that, while on the one hand the police throughout the country are rigidly enforcing the regulations against bright lights on motor cars, they are absolutely ignoring the requirement that all vehicles must carry red rear lights? Are not very serious accidents likely to result from this extraordinary proceeding?

. . . .

If some of us cannot quite agree with the conclusions arrived at in the recent American report on "Bituminous Materials for Road Construction," shall we not all agree that if a report, on the same lines, could be compiled [illegible] Road Board it would be a great benefit to the community of this country? Shall we not also agree with the statement in the above-mentioned report that there is no [illegible] that every case must be carefully considered in the light of traffic, climate, surroundings, and so forth? Would the road engineer be required any longer if a "universal remedy" could be found?

. . . .

Is it not rather curious that in such an apparently simple matter as the fixing of the right position of [illegible] failures? Was not the article in last week's issue of THE SURVEYOR just the very thing that is needed, and one which should be read by every surveyor in the country? Have we not all suffered in our day from the difficulty of "spotting" the direction given [illegible] we sufficiently realise that attention to small matters [illegible]

. . . .

Is it not greatly to the credit of Mr. Noble Twelvetrees, M.I.MECH.E., that he should have been instrumental in persuading the Commandant of the City of London National Guard to form a special corps of engineers as a unit in that well-organised and excellent force? Is it not to be hoped that every engineer who is over forty years of age, but still physically fit, will join this corps, and thus set an example to the many who are not doing their share [illegible] Is it not a fact that in joining this corps the times of drill, &c., are so well arranged that even the busiest man can find time to make himself efficient without encroaching on his office work?

. . . .

Why is it that some municipal authorities will try to interfere in the question of the taking of pupils by their surveyor? Is it not only common sense that if a pupil is forced on the surveyor it would be most unfair to the pupil and his chief, and that if, on the other hand, the "authority" prevent the surveyor from taking a reasonable number of pupils, the country as a whole must suffer from a scarcity of properly trained municipal engineers?

. . . .

Is it possible that at last there is a prospect of rubber entering into the composition of the material of which road surfaces will be constructed in the future? Does it not look as if there is now a likelihood of this when we see in the public Press that a company "Rubber Roadways, Limited" has recently been formed with a capital of £90,000, to carry on business in connection with the use of rubber for road making? Is it not evident that if this material can be economically used in road construction there should be a future for this company?

. . . .

Is it not curious to note that at Long Ditton Church there is a monumental brass, said to be of about the date 1500, in memory of John Haymer, a former rector, of whom it is stated that he was a "benefactor to the poor and to the highways," also another brass, dated 1527, to one Robert Castleton, who directed his executors to "ley or cause to be laide in Ditton Strete in the church path oon hundred load of gravelle wt in the space of thre yeares after my decesse"?

Tree Planting in Streets.

EXPERT'S REPORT TO KENSINGTON BOROUCH COUNCIL.

At the request of the Kensington Borough Council Prof. J. B. Farmer, M.A., D.Sc., F.R.S., F.L.S., of the Imperial College of Science and Technology, South Kensington, has prepared for that authority a report on the matter of tree planting in London streets.

In his preliminary observations Prof. Farmer remarks that trees which are growing in streets are placed under highly artificial conditions. They cannot be expected to flourish as they do in the country, and it would not be practicable to allow them to do so even were it otherwise possible. It may, he thinks, be admitted as an axiom that the trees are planted there primarily for the sake of the streets, although it sometimes seems as if the streets exist rather for that of the trees; but they ought to form part of the architectural scheme, and should be selected and grown in accordance with this principle. While enhancing, as far as may be, the amenities of the locality, they ought to be so planted as to cause the least possible inconvenience both to the inhabitants and the users of the street. These objects can be realised by securing the right sort of tree, by keeping it within proper limits of size, and by dealing with each street as a whole on a definite plan, the details of which have been fully thought out and arranged beforehand.

The writer of the report says there is room for divergence of opinion on matters such as the choice of the species or the shape to be aimed at, but that whatever decision is finally arrived at on these or other points, it should be rigidly adhered to as governing the treatment of the whole length of a street or road—at any rate for so far as the planting may extend. It should be frankly recognised that any consistent scheme of street planting is bound to be on the lines of formal gardening—*rus in urbe* is not a practical proposition, save in a very restricted sense—and a "natural growth" is commonly unsuited to all but the widest thoroughfares or avenues, and even in them a limit is soon reached when, if the trees be allowed to extend further, they become a nuisance to at least some of the inhabitants. Many streets have been completely spoiled through the ragged appearance caused by the removal or severe lopping of a few of the trees as the result of complaints, which are in themselves reasonable enough, but for which grounds need not have been given.

CHOICE OF TREES SUITABLE FOR PLANTING.

"In London," Prof. Farmer continues, "the number of species that can be planted with any prospect of a satisfactory result is very limited. Not only must they be able to stand smoke and fog, but they must be amenable to pruning, and readily assume a suitable shape. Nevertheless, the improved atmospheric conditions that now prevail as compared with those of a quarter of a century ago render it possible, and I venture to suggest even desirable, to experiment with promising subjects. In this way the monotony that threatens the London streets, owing to the almost exclusive use of the plane, will be obviated." The report proceeds:

The London Plane (*Platanus acerifolia* Willd).—Without doubt this is the most useful tree for planting in a city like London. It will grow in almost any kind of soil, and can withstand the bad conditions of aëration that exist under stone or concrete pavements. Its healthiness, as well as its clean appearance, tends to be maintained owing to the manner in which it gets rid of much of its smoke-begrimed bark by shedding the scales every year. It stands pruning, and even the hardest cutting back, better than almost any other tree, except, perhaps, the lime. But it needs attention in order to prevent its naturally vigorous development rendering it unsuitable for the area at its disposal. It also labours under the suspicion of causing injury to the respiratory organs of delicate people, owing to the hairs which are shed by the leaves as they reach maturity, and still more to the stiff bristles that easily break off the ripe fruits, and so get carried in the air. I do not think the case against the tree on this account has been really proved, but it is a fact that in some foreign towns, particularly in Germany, it has fallen into disfavour.

The Lime (*Tilia europaea* L.).—There are several forms of lime included under this name, and they are often to be seen as urban trees. They are hardy, and submit to pruning, but they all exhibit qualities that, in my judgment, render them unsuitable for streets. During periods of prolonged drought they are apt to throw their leaves prematurely, and thus to assume a dreary autumnal character even during the height of summer. Furthermore, they are particularly liable to attacks of aphides, and these greatly increase a natural tendency to produce a drip known as "honey-dew," an excretion which makes the pavement beneath a tree both sticky and filthy. But there is another species of lime—*Tilia euchlora* C. Koch, which has been planted with success on the Continent, and is free from the disadvantages of the common lime. It appears to be thoroughly well worth a trial in London. It is a very beautiful tree, with large, bright green leaves. It seems to be quite free from the aphis trouble, and it would, if successful, form a very valuable addition to the small number of trees available for street planting. I would suggest that it should be tried in a few of the shorter streets as an experiment that is well worth carrying out.

The Tree of Heaven (*Ailanthus glandulosa* Desf.) is not always planted with satisfactory results. I think this is largely owing to the lack of attention in training and shaping that the young trees too often receive. It is a handsome tree, with a well-marked character, and as it stands cutting well, besides being a good grower, it is really well adapted for street planting. It should be borne in mind when purchasing the plants that the tree is unisexual—that is, male and female flowers are produced on different individuals. Only the female tree should be planted, as the male flowers have a most unpleasant odour.

The Elm (*Ulmus*) is represented by several species, most of which, although making good specimens for parks, are quite unsuitable for the street. This is partly owing to the large size and free growth needed to make good and ornamental specimens, but partly also to the dangerous habit they have of throwing off large branches with little or no warning. There are two sorts which have merit for urban purposes—viz., the Cornish and the Jersey elms. The Jersey elm (*Ulmus stricta* var. *Wheatleyi*) is the better of the two. It is of erect habit, and naturally assumes the pyramidal form which most trees have to be pruned to acquire. But elms should not be retained when they become old on account of the shedding of the branches, to which attention has already been drawn.

The Ash (*Fraxinus excelsior* L.).—There seems no reason why this tree (especially the variety known as *Monophylla*) should not be planted in streets of sufficient width. The light foliage is a distinct advantage, but the ash requires a good, heavy soil, and does not stand drought. If its requirements in these respects were met, there seems no reason why so beautiful a tree should not be utilised in the damper localities, although some difficulty might be experienced in obtaining the variety in any quantity.

The Horse-chestnut cannot be recommended for street planting, as it is naturally too large, and does not lend itself readily to cutting; but a pink-flowered hybrid, known as *Aesculus plantierensis*, forms a beautiful tree, and might be tried in a street where the houses are set back from the pavement, so that they would not be unduly shaded. An advantage which this hybrid possesses over the common as well as the red chestnut lies in the circumstance that it produces no fruit, and thus escapes the attentions of boys.

The Poplar.—There are two kinds worth considering in connection with the subject of this report. Both of them are pyramidal sorts—one the Lombardy poplar (*Populus nigra* var. *Italica*), the other is known as Bolle's poplar (*Populus Bolleana* Carr.). This latter tree somewhat resembles the well-known Lombardy poplar, but is of a wider and better shape, with the leaves white or silvery beneath. Poplars require a moist soil, and if this point were attended to they ought to flourish fairly well.

I am aware that they have failed in some streets where they have been tried, where, in addition to unsuitable soil, they had to contend with a leaky gas pipe; but on heavy soil, given moderate attention, they ought to thrive, and their peculiar form is especially appropriate in streets in which a freer-growing species might be out of place.

The Acer Pseudo-platanus is sometimes planted as a street tree, but, although very beautiful when well grown, I think its habit of littering its leaves through the summer, coupled with its rather straggly habit and somewhat brittle wood, render it unsuitable for this purpose.

IMPORTANCE OF REGULAR SPACING.

Whatever species of tree be decided on, it is of the utmost importance that the planting should be conducted on a properly arranged plan. . . . The trees are best planted from 50 ft. to 60 ft. apart; they should not be closer together than 45 ft., nor should the upper limit of 60 ft. be greatly exceeded, except under special circumstances. The practice of planting at very short intervals, with the intention of removing every alternate one later on, has but little to commend it, and in any event it is very wasteful. I may, perhaps, be allowed to suggest that the planting plan should first be drawn out on a large-scale map, as it would then be possible so to arrange the spacing in relation to the cross roads, and any structural features affecting the distances apart of the trees, as to disturb the regularity of intervals as little as may be. The actual distance between the trees is, within reasonable limits, far less important than the securing of a good general effect such as can only be obtained by a fairly uniform spacing. Another point to which I would venture to draw attention is that in streets where the houses have forecourts the effect of planting in the road would be finer if the owners of the houses could be induced to cease growing trees of their own in their frontages.

As a general rule the streets most suitable for trees are those which run north and south. The trees on both sides of the road receive their due share of sunlight, and the houses on neither side are unfairly deprived of their light. In streets running east and west the trees are apt to become a nuisance to the people who live on the north-facing side of the road. Of course, this must not be interpreted too strictly, as it obviously applies but little to roads that are of considerable width. . . . And in this connection it may be questioned whether trees ought ever to be planted in streets of less than 50 ft. in width. They would have to be kept very small, and it would probably be unwise to deprive the houses of any of the light and air which they are able to receive.

SIZE OF TREE AND SEASON FOR PLANTING.

While the size of tree is determined by what can be obtained from the nursery—and this will vary with the species to be planted—where possible trees from 12 ft. to 16 ft. high is suitable, although plane trees of a still larger size can be bought and safely transplanted if they are procured from a good nursery where they are frequently moved so as to keep a compact ball of roots. Care should be taken to see that the young trees are symmetrical, and that they have not been too crowded in the nursery; otherwise time is wasted before they start away into good growth. Moreover a few badly formed individuals may easily spoil the pleasing effect of a whole row. When the trees are in their places, the trunk should be clear of side branches for 8 ft. or more, and, of course, as the crowns begin to spread the lower branches must be further cleared to free the traffic of the roadway.

As regards the best time for planting, this may be done at any time when the leaves are off the trees, but from about the middle of October and on through November is the best season, as the soil is still warm. So long as the ground is not frozen or too wet, the work may be carried out up to March. The trees move best if they are transplanted with balls of earth; in this way less damage is done to the fibrous roots around the base of the trunk, and they commonly start into growth more quickly than if the soil is shaken out of them.

PREPARATION OF THE GROUND.

It is often advisable to replace part of the soil excavated from the street by stuff of better quality. This should always be done if the situation is specially unfavourable—e.g., on a bridge—but the extent to which it is requisite will vary so much, according to the nature of the original ground and the kind of tree to be planted, that it is impossible to lay down any definite rule. The matter is one which must be left to the planter. A skilful tree expert who understands his work will be the best judge in each particular instance how much good soil it may or may not be necessary to add. The general principles which govern the matter are easy to grasp. The tree must root rapidly, and start as soon as possible into vigorous growth, and for this a good rooting medium is needed. But as it is not intended that the tree shall become very large, a subsequent extensive development of roots is commonly undesirable, altogether apart from the trouble that might be caused by interference with gas mains, telephone conduits, &c. What really is required is that the root system shall get to work quickly at the start. All that is further wanted is that when once the tree has got hold of the ground there shall be a root system just sufficient to maintain it in good growth, and in a condition vigorous enough to enable it to stand the necessary shaping and cutting back. There must, of course, be no dying back of the branches due to root starvation, but, with the exercise of proper judgment at the time of planting, there ought to be no risk of the occurrence of this.

AREA OF EXPOSED SOIL ROUND THE BASE OF THE TREE.

When the tree is planted and staked, an open space ought always to be left around the base of the trunk, in order that the air may have free access to the soil. Roots require air to breathe, and deficient aëration is sometimes a cause of failure, particularly in relatively impervious soils. Plane trees are less sensitive in this respect than are most trees, and they will often flourish when there is only a square 2 ft. or 3 ft. of exposed soil round their stem. Possibly this hardiness is partly due to the way in which the trunks renovate their surfaces by means of the annual scaling of the bark. Most other trees are the better for an iron grating over the exposed soil area. This prevents the earth from being trodden hard, and water as well as nourishment can easily be given if necessary. For trees that are less hardy than the plane a grating should be given, and it ought not to be less than 3 ft. square for young trees, and if a larger one can be given so much the better. It is probably impossible, even were it desirable, to imitate the large gratings used in some cities—notably in Paris—but it should be always remembered that adequate aëration of the soil is one of the first requisites for success in growing trees.

SUBSEQUENT ATTENTION AND PRUNING.

After the trees have been planted they must not be left to themselves, but they should have the constant attention of a man who understands the work. Many of the attempts at tree planting have proved miserable failures because the individual trees have not been looked after, and the special requirements imposed by street conditions have not been sufficiently appreciated.

It is essential that, while the general effect of the trees as a whole in a street should be pleasing, and even imposing, they ought not to be allowed to rob the houses of an undue amount of light. On this ground alone it is evident that it is impracticable to permit any vigorous tree to grow to its "natural" size, and to develop (save in the case of pyramidal trees) its "natural" form unchecked. The size must be determined by considerations of space available in the street, while the form will also be similarly suggested by the height of the houses, width of the pavement, and, in general, by the amount of shading that is desired. Thus the form will come to be a more or less artificial one. In comparatively narrow pavements, and when the houses abut directly upon it, a pyramidal shape is probably the best on the whole. A tree of this form interferes least with the light that ought to reach the houses, and while the effect of a double row of well-placed and spaced trees, however formally they are trained, is not otherwise than decorative, it is secured without the sacrifice of hygienic considerations that ought to stand first. Of course, where the street and pavement are wide enough, a freer growth may justly be advocated. But however favourable to the tree a street may be, it will not be found possible to dispense with some measure of training and cutting. This should be taken in hand from the first, and then there would be an end to the hideous mutilated subjects that too often spoil the roads and avenues they ought to adorn. It ought never to be necessary to convert the trees into a row of telegraph poles, nor is it wise to defer training until extensive lopping provides the only remedy for past neglect. The pruning for shape as well as for size ought to be done annually, or at least at reasonably short periods that may vary in individual cases. Young trees certainly want looking after every year to clear out the useless twiggy growth that will inevitably tend to spoil the tree unless it is thinned

out. The older ones will be the better for frequent overhauling, as the effects of a light pruning are not so apparent and will not be so likely to arouse hostility as would be the case if delay renders more drastic treatment necessary.

A man who knows what he is about can easily secure any desired shape in the case of an amenable tree like the lime or plane. The latter is especially responsive to the knife, whether a formal pyramidal shape (like that of the very successfully trained trees in the Mall) or a more open character is wanted. But, however carefully pruning may be carried out, it will be necessary sooner or later to remove some of the larger branches. These should, if possible, always be cut right out to their base, and the wound, if smoothed and tarred, will soon heal over and become obliterated. If judiciously done, and with due regard for the filling of the gap, but little damage, if any, need be caused to the appearance of the tree.

Another advantage is secured by regular and systematic pruning, inasmuch as a balance is thereby established between the root and the upper part of the tree.

When a large crown is allowed to develop a correspondingly large root system is also formed. If such a tree be severely lopped, the large root system, it is true, will tend to bring about a vigorous recovery. But no such lopping ought to be needed, and on every other ground a moderate root system, such as can be automatically secured by continuously maintaining a moderately-sized top, is to be desired. . . .

Of course, whatever care be taken of the trees growing in streets, they cannot be expected to flourish as they would do under better and more natural conditions. The poisonous effects of minute quantities of ethylene gas, as well as of sulphur compounds, also militate against them. But the increased use of electricity and the concomitant diminution of the products of combustion of coal gas appear to be leading to a steady improvement of the atmospheric conditions in London, and perhaps a corresponding improvement in the health of the trees may be anticipated. At any rate, the time seems to have come when species other than the plane may be tried with some prospect of success. I venture therefore to suggest that, although the plane must continue to occupy the leading position to which its excellent qualities fully entitle it, at least some of the other species mentioned in this report should be tried, if on only a small scale.

SUMMARY OF THE FOREGOING REPORT.

The principal recommendations embodied in this report may be conveniently summarised as follows:—

(1) The trees most suitable for planting in the streets are:—

The Plane (*Platanus acerifolia* Willd.). Indifferent as to soil.

Tree of Heaven. (*Ailanthus glandulosa* Desf.). Indifferent as to soil if well drained.

Jersey Elm (*Ulmus nitida* var. *Wheatleyi*). Heavy soil, but tolerant.

Lombardy Poplar (*Populus nigra* var. *Italica*). Heavy soil; must not be too dry.

Others worth trying are:—

The Lime known as *Tilia euchlora* C. Koch. Tolerant, but should have good loam.

Sycamore (*Acer Pseudoplatanus* var. *purpurascens*). Heavy soil, with chalk or lime.

Balm of Gilead Poplar (*Populus Balsamifera* Candicans). Heavy soil.

Pink Hawthorn (*Crataegus plena*). Rather heavy soil, but tolerant of others.

(2) The trees should be planted, as far as possible, at equal distances from one another, their actual position being determined on a plan. A suitable distance would be 30 ft. to 40 ft., but narrow pyramidal trees might be a little closer together. Regard should be paid to the position and width of cross roads, entrances, and other obstacles, in order to realise the best effect in spacing as far as possible. Streets that run north and south are, other things being equal, better for planting than those running east and west. The trees in any one street or road should be of one species only, and as far as possible they should be kept even in size, and be shaped on a uniform scheme. The shape may be pyramidal or open, the latter being suitable for roads that are wide, and especially when the houses are separated from the pavement by forecourts.

(3) The trees may be planted at any time when the tree has shed its leaves, so long as the ground is not frozen or too wet. The latter half of October and the month of November is, however, the best time. The size of tree to plant depends on the species and on other circumstances, but a height of from 12 ft. to 16 ft. will be generally suitable. The trees are more likely to grow without a check if they are transplanted with a good ball of earth, as there will be a large number of uninjured small roots. The soil should be made firm during and at the completion of planting.

(4) Trees, when planted, commonly require the addition of good soil to start and maintain them in vigorous condition; but the urgency of this need will naturally vary with the locality, and also with the species of tree.

(5) It is essential that a certain area around the base of the trunk shall be freely exposed to the air in order that the roots may be able to breathe properly. Different trees vary in respect of this, the plane making, perhaps, the least demands. In the case of most trees a grating is desirable to prevent the soil being trodden hard, such gratings being from about 4 ft. square and upwards.

(6) The trees should receive frequent attention in order to secure and maintain an appropriate shape and size. Good results cannot be looked for unless this be done. Much of the unsightliness of a number of London trees is the natural result of inattention to this matter. Lopping ought seldom to be necessary, and by careful pruning a balance can be struck between the development of the crown and the root system.

(7) The improved condition of the London atmosphere within recent years renders the experiment of varying the kinds of trees to be planted a hopeful one. While it is recognised that the plane is certain to continue to be the most thriving tree, there is, perhaps, something to be said in favour of avoiding complete monotony by the introduction of other kinds of trees into the streets of the Royal Borough.

RECENT CIRCUMSTANCES AFFECTING ROADS.

To the Editor of The Surveyor.

Sir,—I quite agree with Mr. Wood that some of the oil residuals are no better than tar—in fact, they have no advantage whatever over pitch or tar when prepared to the same degree of consistency, and there is no single quality possessed by an oil residual that is not contained in a prepared or tempered pitch, except, perhaps, the smell.

Native bitumen, on the other hand, derives its many advantages from the valuable mineral matter given it by Nature, and I can quite understand that the roads constructed by Mr. Wood in Fulham with natural bitumen have proved satisfactory.—Yours, &c.,

Citizen.

March 8, 1915.

Architects in the Forces.—The Royal Institute of British Architects has compiled a record of the members of the profession who have joined various branches of the Imperial Forces. The list now contains more than 1,200 names.

Glasgow's Reduced Street Lighting.—In Glasgow on Tuesday night a partial restriction of the street lighting was inaugurated, a step rendered necessary by the shortage of the coal supply. The scheme is that alternate gas lamps only are lit. The electric lighting is not affected.

Damages Against West Ham Corporation.—Damages amounting to £300 were awarded against the West Ham Corporation in an action in the King's Bench Division, brought by Herbert Spicer, a baker's assistant at Leyton, in respect of personal injuries he received last May. Plaintiff's case was that when he was driving a van along the Broadway, Stratford, a wheel of the vehicle was wrenched off owing to the defective condition of the tramway. Plaintiff was thrown to the road and his arm was broken, and its movement permanently impaired. The corporation denied plaintiff's allegations as to the accident and repudiated liability.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, 8t Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

460. Sewage Sea Outfall.—Are reinforced-concrete pipes better than cast-iron pipes for a sewage outlet into the sea which is covered at high water? Compare them as regards initial expense and maintenance. (J. R. H., *Ipswich.*)

463. Bomb-proof Dug-out. Give sketches of a bomb-proof dug-out to hold five people. (Theo.)

464. Masonry Arch. State three ways in which a masonry arch may fail, and describe the cause of each. (J. F., *Padiham.*)

465. Girder Design. What are the main points to be borne in mind when determining for a given purpose: (*a*) Type of girder; (*b*) proportions of girder (depth and width, &c.); (*c*) material to be employed (steel, wrought iron, or reinforced concrete)? (M. T. R., *Ebgl.*)

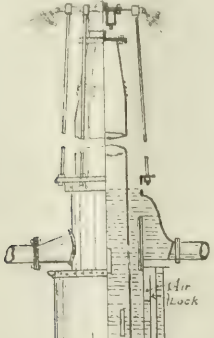
466. Road Making.—Describe a few simple tests that will enable an engineer to ascertain the quantity of the bitumen and filler to be used in a bituminous macadam road. (Enseer.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

459. Sewage Sprinkler.—Describe an efficient form of sewage sprinkler for percolating filters which requires very little head of sewage to work it. (J. R. H., *Ipswich.*)

A suitable sewage sprinkler which will work with a small head and at the same time give a variation in volume from five to six times is the "Adams." The advantage of this sprinkler is the fact that no gland or joint of any kind is used between the stationary column and the revolving body of the distributor. A simple airlock seal is used, which



is formed by the air left in between the annular chamber in the lower and stationary tank and the annular air space in the upper and revolving tank. The air is thus entrapped, and held under pressure due to the weight of water upon it, with the result that the water rises up to the height of the hydraulic head within the revolving body and over the distributor arms, and the distributor then revolves without friction. The mechanical wearing part is the ball race on the summit of the central column. Upon this ball race the whole weight of the distributor hangs and revolves. There are many other good patent sprinklers on the market, particulars of which can be obtained from the respective manufacturers. (Eneer.)

461. Applied Mathematics.—Give some simple examples of the application of the calculus to the solution of practical engineering problems. (Student.)

Find the magnitude of the resultant thrust on the end of a tank filled with water, the depth of the water being 10 ft. and the tank 16 ft. wide.

Considering an elemental strip of the submerged portion of area d at a depth x ft.

Weight of water = 62 lb.

Pressure at level of strip = 62 x lb. per sq. ft.

Area of strip = 16 dx sq. ft.

∴ Thrust on strip = $62x \times 16\,dx$

$= 1000\,x\,dx$

Total thrust $= \int_0^{10} 1000\,x\,dx$

$= 1000 \left[\frac{x^2}{2}\right]_0^{10}$

$= \frac{1000 \times 100}{2} = 50{,}000$ lb.

Find the point at which the resultant force in the preceding question acts—*i.e.*, the centre of pressure.

The centre of pressure will obviously be on the vertical line bisecting the rectangle, since the figure is symmetrical. Let the surface of the water be AB. To find the distance of the centre of pressure from AB, we have

Thrust on elemental strip $= 1000\,x\,dx$ lb.

Moment of this thrust about AB $= (1000\,x\,dx)\,x$ ft. lb.

Total moment about AB $= \int_0^{10} 1000\,x^2\,dx$

$= 1000 \left[\frac{x^3}{3}\right]_0^{10}$

$= \frac{1000 \times 10^3}{3}$ ft. lb.

Resultant thrust = 50,000 lb.

Let Y be the distance of centre of pressure below AB.

Then we have $50{,}000 \times Y = \frac{1000 \times 10^3}{3}$

$\therefore Y = \frac{1000 \times 10^3}{3 \times 50{,}000} = \frac{20}{3} = 6\frac{2}{3}$ ft.

below the surface.

(B. K., *Newport Mon.*)

[illegible] flywheel

[illegible] $= \pi r^2 dx \rho l$) $r^2 = 2\pi\rho l r^2\,dx$

Where ρ is mass per unit volume = for iron ·28 lb. per

Total inertia $= 2\pi\rho l \int_0^{R} r^2\,dx = 2\pi\rho l \left[\frac{R^4}{4} - 0\right]$

$= \frac{\pi}{2} R^4 l\rho = (\pi R^2 \rho l)\,\frac{R^2}{2} = \frac{M R^2}{2}$

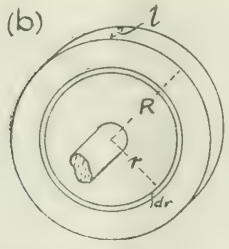
M being total mass of flywheel.

The energy of the flywheel can now be obtained, for it is easily shown that $K.E. = \frac{1}{2} I \omega^2$, ω being angular velocity in radians.

The radius of gyration (k) is defined by the equation

M $k^2 = I$ - *i.e.*, if the whole mass were concentrated at the radius of gyration, the inertia would be the same as before.

Then $M k^2 = \frac{M R^2}{2}$ or $k = \frac{R}{\sqrt{2}}$



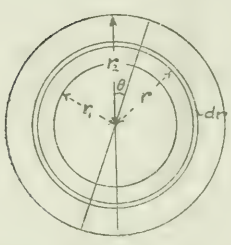
Strength of torsion shafts—

Let the shaft be twisted through an angle θ, and let the skin stress be f_2. Let f_1 be the stress at radius r

Then $f_2 \propto r_2 \theta$

$f_1 \propto r \theta$

$f_1 = \frac{f_2}{r_2} r$



Total force (often called "stress") on element

$= (2\pi r \cdot dr) \frac{f_2}{r_2} r = \frac{2\pi f_2}{r_2} r^2 dr$

Moment of resistance of element = force × radius

$= \frac{2\pi f_2}{r_2} r^3 dr$

Total strength of shaft $\frac{2\pi f_2}{r_2} \int_{r_1}^{r_2} r^3 dr = \frac{\pi f_2}{2 r_2} (r_2^4 - r_1^4)$

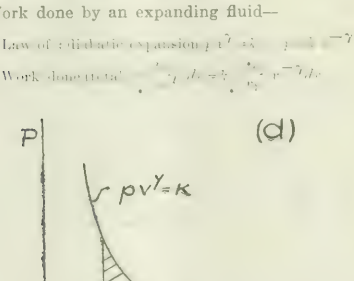
If the shaft is solid, total strength $= \frac{\pi f_2 r_2^3}{2}$

It follows that if, in place of a 4-in. solid steel shaft, we can substitute a hollow 4½-in. shaft of equal strength, its internal diameter will be 3·3 inches and the weight will be reduced from 41·6 lb. per foot run to 23·5 lb. This is an item to be considered, particularly in naval and marine engineering. Usually r_1 is about $\frac{3}{5} r_2$.

Work done by an expanding fluid—

Law of adiabatic expansion $p v^\gamma = k$ or $p = k v^{-\gamma}$

Work done total $\int_{v_1}^{v_2} p\,dv = k \int_{v_1}^{v_2} v^{-\gamma} dv$



$= k \left[\frac{v^{-\gamma+1}}{-\gamma+1} \right]_{v_1}^{v_2} = \frac{k}{\gamma - 1} \left[\frac{1}{v_1^{\gamma-1}} - \frac{1}{v_2^{\gamma-1}} \right]$

$= \frac{p_1 v_1}{\gamma - 1} \left[1 - \left(\frac{v_1}{v_2} \right)^{\gamma - 1} \right]$

An important formula in steam and gas engine calculations.

(F. W. P., *Loughborough*.)

Flow of water over triangular notch.—Angle 90°.

Consider layer AB of water of thickness dx at a depth x below surface

Let depth of water in notch be H

Width of strip (B C notch) = $2(H - x)$

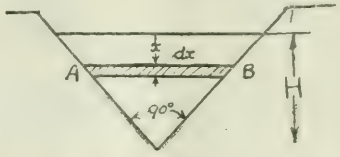
Area of strip = $2(H - x)\,dx$

Theoretical velocity of water under this head = $\sqrt{2gx}$

Quantity of water passing strip AB per sec. = area × velocity = $2(H - x)\sqrt{2gx}$

Total flow ng over notch

$2\sqrt{2g} \int_0^H (H - x) x^{\frac{1}{2}} dx = 2\sqrt{2g} \left[\int_0^H H x^{\frac{1}{2}} dx - \int_0^H x^{\frac{3}{2}} dx \right]$



$2\sqrt{2g} \left[\frac{2}{3} H x^{\frac{3}{2}} \right]_0^H - 2\sqrt{2g} \left[\frac{2}{5} x^{\frac{5}{2}} \right]_0^H$

$= 2\sqrt{2g} \cdot \frac{2}{3} H^{\frac{3}{2}} - 2\sqrt{2g} \cdot \frac{2}{5} H^{\frac{5}{2}} = 4\sqrt{2g} \cdot \frac{2}{15} H^{\frac{5}{2}} = kH^{\frac{5}{2}}$

This constant k is found by experiment to be 2·635

Quantity (cub. ft. per sec.) flowing over sharp-edged notch shaped like right-angled isosceles triangle = 2·635 $H^{\frac{5}{2}}$ (H in feet).

(W. R. H., *Waltham Cross*.)

EXPENDITURE ON LOCAL WORKS.

A GOVERNMENT CIRCULAR.

In the House of Commons on Wednesday Mr. Herbert Samuel, President of the Local Government Board, stated, in reply to questions, that he was about to issue to local authorities a circular emphasising the desirability of restricting local works in view of the need of economising both labour and capital.

A New Urban District.—Official notice has been received confirming the order of the West Riding County Council constituting Adwick-le-Street, Skellow and parts of Owston and Brodsworth a new urban district. Included in the area are Brodsworth and Bullcroft collieries, and the Woodlands model village.

Elephants for Road Making.—The German military authorities are reported to have mobilised the elephants from Hagenbeck's menagerie. They have been sent to Valenciennes with their keepers, where they will be employed to help in road making and for other work where great drawing power is required.

Water Supply in Siam.—A British consular report issued yesterday states that a sum of £5,000 was allotted to the Bangkok waterworks for the year 1913-14, and that the works are expected to be completed and in operation by April 1. The laying of the pipes has already been completed, and fountains and hydrants have been established along the principal roads.

Value of Sewage Sludge.—Dr. J. Grossmann, M.A., on Friday last, at a meeting of the Manchester Section of the Society of Chemical Industry, read a paper on "Concentration of Sewage Sludge." Dr. Grossmann pointed out that the cheap and effective manner in which the sludge could be obtained in a concentrated form should be of special interest to Manchester and Salford, where the sludge was carried by means of a steamer to the sea and dumped there. Sewage sludge represented an intrinsic value of at least £2,000,000 per annum, and it should be recognised that it was a national asset which should be dealt with by the Government in the interests of agriculture, to which a cheap and efficient manure will be of incalculable benefit.

SOME RECENT PUBLICATIONS.*

Lockwood's Builders' and Contractors' Price-book, 1915. Edited by Francis T. W. Miller. Price 8s. London: Crosby, Lockwood & Son.

The new edition of "Lockwood" is issued to bring upon the old plan, and those who are accustomed to use this excellent price-book will find it every whit as useful as in past years. The principal additions to the volume are the result of the Labour Unrest, and the consequent difficulty in forecasting prices in the future, particularly in regard to wood goods. The list of prices is very complete, and the memoranda in the appendix refer to most matters which the builder or contractor is likely to know in daily practice. The London Building Acts, 1894 to 1909, and various enactments and regulations relating to buildings in the Metropolis are contained in a supplement. Lockwood's price-book has made many friends in the past, and may be recommended as a thoroughly comprehensive and reliable work for builders, contractors and others concerned in estimating and pricing.

Laxton's Price-book, 1915. Price 4s. London: Kelly's Directories, Limited.

It will come as a surprise to many to learn that this well-known standard work is approaching its centenary, the present being the ninety-eighth annual issue. The volume, which retains its familiar form, will be found to contain some 73,000 prices, in addition to valuable appendices of by-laws, statutes, and decisions of the courts affecting the building trade. The work needs no recommendation, as it has long been considered as an indispensable adjunct to every builder's office. Suffice it to say that the present issue well maintains the traditional standard. It is pointed out in the preface that the present shortage of certain materials derived from abroad, and the high prices demanded for such articles (especially timber and zinc), make it difficult to amend the old prices with any accuracy so as to apply to the future. Those who use the book must, of course, watch the market, and in the abnormal circumstances make their own adjustments.

Machine-shop Practice. By W. J. Kaup. Price 5s. 6d. nett. London: Chapman & Hall, Limited.

This volume forms one of the Wiley Technical Series, and is intended as a manual for apprentices and journeymen machinists, and for use in trade, industrial and technical schools. It is desirable that such a work should be concise and yet something more than and different from a mere collection of formulæ and rule-of-thumb methods. In this direction the author has well succeeded in his task, inasmuch as [illegible] of shop [illegible] invariably accompanied by the reasons which have led to their adoption. Interspersed throughout the book are several series of practical questions to enable the student to assure himself that he has mastered the preceding work. The necessity for system is emphasised in a very useful appendix.

Mechanism of Steam Engines. By W. H. Dooge and M. W. Dole. Price 8s. 6d. nett. London: Chapman & Hall, Limited.

This work, which is published in New York by Messrs Wiley & Sons, is appropriately and accurately named, inasmuch as it makes no attempt to deal with the underlying heat theory or the details of construction, but is confined to the kinematics of reciprocating steam engines and steam turbines. The subject is treated clearly, concisely, and in logical order, commencing with a general discussion of a reciprocating steam engine and proceeding by stages to a consideration of steam turbines and their valve mechanisms and governors. The book should prove very useful to students who are familiar with the elements of mechanism, but who have not yet studied the theory and practice of heat engineering or machine design.

Materials by Machines. By A. W. Smith. Price 5s. 6d. nett. London: Chapman & Hall, Limited.

This book is intended to give the reader an elementary account of the several metallic materials used in the construction and operation of machines. The first part of the work deals with the manufacture of materials, and contains, among other matters, a good, though brief, account of the metallurgy of iron, steel, copper, lead, tin, zinc and aluminium. The second part is concerned with the properties of materials, the final chapter being devoted to the selection of materials for machines. The author has succeeded in stating clearly a group of correlated facts in a single very useful volume.

The Sanitary Record and Municipal Engineering Year-book. Price 5s. nett. London: The Sanitary Publishing Company, Limited.

This is the thirty-third annual issue of this publication, and it has not only been thoroughly revised, but also considerably enlarged. The directory of municipal authorities and their officials is very complete, while the scientific and technical data and the lists of municipal engineering, public health and scientific institutions and societies have been carefully brought up to date. We cordially commend this work as a useful desk companion for all connected with municipal engineering, public health and sanitary work.

Willing's Press Guide, 1915. Price 1s. London: James Willing, Limited.

Following the precedent of former years, the forty-second annual issue of this well-known publication has been carefully revised, and its reputation is well maintained as a handy work of reference in regard to all Press matters. The information appears to be remarkably complete, and is well arranged. The work is useful alike to the professional journalist and the freelance.

Building Construction Drawing. Part II. By Richard B. Eaton. Price 1s. 6d. nett. London: E. & F. N. Spon, Limited.

Part II. of Mr. Eaton's work consists of a series of twenty-six well-drawn plates together with descriptive specifications. The drawings are practical and instructive, and are thoroughly suited to the requirements of the elementary student, and the artizan for whom they are more particularly intended.

Russian [illegible] Tables

In view of the increasing importance of trade with Russia, the issue of information regarding the somewhat complicated Russian weights and measures, and especially of equivalent tables, permitting of instant conversion of British weights, measures and money into Russian and *vice versâ*, is of considerable interest to the trading community, and many of our readers will doubtless be glad to know that the Central Translations Institute, Limited, 265 Strand, W.C., have compiled from official figures a set of tables covering all ordinary commercial requirements, and have published these at the price of 1s. nett.

Bituminous Materials for Road Construction. The concluding instalment of the matter which appeared under this heading in last week's issue is unavoidably held over.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Carlisle R.D.C. (March 2nd. Mr. R. G. Hethering ton). £59,250 for a water supply scheme from Roughton Gill, in the Caldbeck Fell. It was stated by Mr. G. A. Lethbridge, on behalf of the council, that the district was in urgent need, only about half of the population being at present supplied with water. The negotiations with the Carlisle Corporation, who were willing to provide water in bulk for their supply, he pointed out, had come to nothing, entirely on the ground of cost. Dealing with the source of the supply, he said it was a disused mine in Caldbeck Fells, and, subject to the approval of the Local Government Board, a contract for the acquisition of the water had been entered into with Lord Lecconfield, who had agreed to accept £1,500 for his water rights.

Goole U.D.C. (March 4th. Mr. H. R. Hooper). £13,000 for the erection of new plant at the gas-works.

The inspector said the Treasury were not prepared to sanction loans for local purposes or for any works which were not absolutely necessary. There seemed no immediate need to spend this money. The consumption of gas was decreasing, and the council should try to get through the war without incurring this expenditure. The gas manager said they would be running a risk. The inspector: Quite so; we are all running risks. I cannot conscientiously advise the board to sanction the loan.

Hartlepool T.C. (March 3rd. Mr. H. S. Stewart). —£15,000 for the erection of working-class dwellings. —In the carrying out of the scheme ninety-one working-class families will be displaced, for the present property is all to be demolished. The districts will then be laid out afresh, new and wider streets being made, and new houses erected. For the present it is intended only to build thirty-four new houses at a cost of from £210 to £250 apiece, leaving the remainder of the land vacant for future development.

Leyland U.D.C. (February 24th. Mr. F. H. Tulloch).—£1,283 for works of water supply.—The proposed works consist of an auxiliary water main to ensure for the higher reaches of the district an adequate water supply. They will also include the execution of works in the township of Clayton-le-Woods. The surveyor, Mr. M. H. Wilkinson, said the proposed scheme had been brought about through complaints by water consumers in the higher districts that on Mondays, and occasionally on other days, when Thirlmere water was being used, especially in very fine weather, the water supply would fail altogether for a few hours. It was considered that the proposed main—a 6-in. one—would provide a complete circulation of water at all times.

Meriden R.D.C. (March 4th. Mr. William Cross). £3,700 for the proposed Fillongley sewage disposal scheme.—It was stated that the county medical officer, Dr. Bostock Hill, in his reports had mentioned several times the necessity of a sewage scheme being provided for Fillongley, and pressure had been brought to bear on the Meriden Council by Birmingham. The estimated cost of the original scheme was £1,700, but it was now proposed to provide the outfall at a greater distance from the village, and the cost of the new scheme was estimated at £4,400.

Newcastle-upon-Tyne T.C. (March 3rd. Mr. M. K. Northe. £29,700 for the provision of baths in three suburbs.—The inspector directed attention to the Treasury recommendation that borrowings by public bodies should be restricted to absolutely necessary schemes during war time, and asked for information to prove that the provision of baths was urgent and necessary, as unless that was forthcoming the board would not sanction the loan. The town clerk, Mr. A. M. Oliver, stated that the scheme was decided upon before the war, and if it was not proceeded with the corporation would have to pay £860 out of revenue for architect's and other fees. It was also anticipated that shortly, owing to War Office contracts being completed, there would be considerable unemployment in the building trade. The scheme had been hurried forward in view of the Local Government Board's request that contracts should be accelerated to provide for unemployment.

Southport T.C. (March 4th. Major J. Stewart).—£9,000 for the development of the lagoon site.—The town clerk, Mr. J. E. Jarratt, said that the council last summer had before them a much greater scheme, but after the outbreak of war they thought it would not be desirable to proceed with it. The cost of the whole scheme would be £30,000 or £35,000. The £9,000 dealt only with one-third of the area they proposed ultimately to put under development. The corporation intended to spend this Spring about £750 to £1,000.

APPLICATIONS FOR LOANS.

Banbury R.D.C. £1,656 for a sewage disposal scheme for Great Bourton, and £919 for a sewage disposal scheme for Little Bourton.

Brampton R.D.C.—£200, supplemental loan for the Castlecarrock sewerage scheme.

Brigg R.D.C.—£4,824 for the erection of houses at Coxhill and Killingholme.

Conway T.C.—£1,275 for the provision of a cemetery.

Darlington T.C.—£13,000 for the electricity undertaking.

Dover T.C.—£6,000 for electrical plant.

Dublin T.C.—£56,030 for the provision of working-class houses.

Folkestone T.C.—£2,040 for the repair of Foord-road.

Hebburn U.D.C.—£470 for hospital extension, £500 for sewerage works, £189 for a street bridge, and £1,855 for school extension.

Melton Mowbray U.D.C.—£4,824 for the erection of twenty-four houses.

Nuneaton T.C.—£1,750 for electricity cables extensions.

Ramsgate T.C.—£116 for street improvements.

Stockton T.C.—£3,261 for water main extension.

Taunton T.C.—£1,175 for the electricity undertaking, and £550 for mains.

Wakefield T.C.—£1,530 for the purchase of land for school purposes, and £250 for road widening.

LOANS SANCTIONED.

Barrow-in-Furness T.C.—£42,537 for the purposes of the gasworks.

Batley T.C.—£6,500 for electrical cable extension.

Chipping Norton T.C.—£1,657, supplemental loan for sewerage and sewage disposal works.

Manchester T.C.—£20,000 for the purposes of the electricity undertaking.

Monmouth C.C. £11,985 for the Newbridge higher elementary school.

Nelson T.C.—£6,344 for private street works.

Neyland U.D.C.—£200 for gas services.

Seaford U.D.C.—£630 for the erection of two workmen's cottages.

Shipley U.D.C.—£12,748 for new municipal offices.

Sunbury U.D.C.—£1,844 for resurfacing Staines-road with Tarmac.

Tunbridge Wells T.C.—£4,155 for sewerage works.

Westhoughton U.D.C.—£1,440 for a refuse pulveriser (£740 for thirty years and £700 for fifteen years).

West Riding C.C. £3,552 for a new school at Wetherby.

Wolverhampton T.C.—£1,600 for a gymnasium at the girls' high school.

FORTHCOMING INQUIRIES.

MARCH.	£

TOWN PLANNING.

25. **Birmingham.** (Mr. Raymond Unwin)

SEWAGE DISPOSAL AT GUILDFORD.

BOROUGH SURVEYOR'S REPORT.

A report prepared by the borough surveyor of Guildford, Mr. E. Young Harrison, on the treatment of the sewage from that borough has been adopted by the town council, and the borough surveyor has been authorised to have made from time to time analyses of the tank and other effluents.

The dry weather flow at present the report says, is estimated at 1,240,000 gallons per day from the high-level sewer, 420,000 from the low-level, and 160,000 delivered by the Woodland Land. The present system includes both tank and land filtration, but the former is to be now abandoned. The area of the farm is 243·50 acres, of which 94·8 acres are devoted to allotments, tanks, filter-beds, buildings, roads, &c., and 18·26 acres are reserved for sewage purposes.

Taking the latter at 20,000 gallons per acre per day, some 27 to 30 acres would be required to deal with the Guildford daily flow. Assuming they of the average were of average strength. As however it may be classed as a strong one, that amount would be a safer figure. If therefore the whole of the 120 acres that are suitable and available for irrigation purposes were entirely devoted to the purification of the tank effluent it would be possible to allow only the land at a time, and then the remaining half could be brought in use to give the first portion the necessary rest. With these figures before me, and the knowledge that until the present time a definite effort has not been made to bring into service for sewage irrigation only the whole of this available land, it appears to me that a fair trial should be made on these lines before the council consider further the question of extending their antiquated works. I would recommend—

(1) That the land be split up into suitable area-metred plots, varying in size from 3 to 6 acres, allocated as follows: Initially flow 240,000 gals., 3·96 ac. 240,000 gals., 6·94 ac. 160,000, area 2·34.

(2) That these plots be ploughed, carefully levelled and rolled.

(3) That the plots be arranged as far as the under drainage supply carriers and fall of the land will allow, so that they may be under definite separate control, effluent carriers and chambers, with penstocks, to be provided where not already existing, so that samples can be taken, and, if found desirable and possible, the sewage may be held in contact with the soil for some hours.

(4) The largest part of the land to be left uncropped though certain plots might with considerable advantage be cropped with mangolds, rabi and rye grass.

It has been impossible, owing to the flooded nature of the land, due to the exceptional rainfall, to take the necessary levels in order that a detailed estimate should accompany this report. A large amount of the work of levelling, however, could be done without increasing the farm staff above the average of the past year. The expenditure upon penstocks, bricks and pipe carriers for the chambers should not cost more than about £80. I suggest that the means of distribution should be chiefly by means of earth carriers in embankment, until we are able to judge as to the results possible.

The management of the farm, to be effective, must be under one head, who should be directly responsible to the borough engineer. The farm has doubtless suffered much through mismanagement in the past. To what extent the present staff is responsible for this it is difficult for me to say. I do not, however, at present feel justified in recommending that a change is immediate, and I would therefore suggest that for a period of six months the superintendent of the sewage destructor works be placed in charge of the whole of the farm and sewage disposal staff under my direction, and that he devote his attention chiefly to obtaining the discharge of the sanitary authority.

Alderman Patrick, chairman of the Drainage Committee, said the report of the surveyor was a very valuable one. It really amended the position between the council and the ratepayers previously, as they knew that they should do less farming, and use the land more for the treatment of sewage. It was estimated that the expenditure suggested would amount to about £50, but if by that means they could treat more sewage on the land without going in for larger expenditure on tanks and filter-beds, he was sure the ratepayers would agree that the money would be well spent.

Mr. J. B. Eggar asked whether the Committee had seen a model.

Alderman Patrick said the tank was working fairly satisfactorily.

A STREET ACCIDENT.

ACTION AGAINST COUNCIL AND CONTRACTORS.

At the Brentwood County Court on Friday last, His Honour Judge Lush, K.C., sitting with Mr. Tom Blundell Brown, of Dytchleys, South Weald, Brentwood, brought an action against the Brentwood Urban District Council and Messrs. S. Cronin & Sons, the latter to recover £10 damages for the loss of a pony which had to be killed following injuries from a fall for which, it was alleged, the defendants were responsible by reason of their negligence in leaving an excavation in the county highway unprotected.

Mr. A. R. Macklin was counsel for plaintiff, Mr. J. Gamble, solicitor, represented the Brentwood Urban District Council, and Mr. C. E. Jones, counsel, was for Messrs. S. Cronin & Sons, contractors.

The defendants, Messrs. Cronin & Sons, on June 27, 1914, were constructing a public convenience in the High Street, Brentwood, under a contract with the Brentwood Urban District Council. The excavation had been enclosed by a hoarding with a gate at each end. Plaintiff's groom left the pony standing while he went into a shop, and immediately his back was turned it ran away, and dashed into the open gate at one end of the hoarding. The cart caught the posts, but the harness broke, and the pony fell into the hole. It had subsequently to be killed.

Plaintiffs contended that the gates should have been closed, or that a man should have been stationed at the gateway.

Mr. Jones submitted that all reasonable precautions had been taken by the defendants. When a pony ran away it ran blindly, and was likely to collide with any obstacle.

The cases cited by Mr. Macklin in support of the contention that the council would be liable for the negligence of the contractors, although they had no control over the contractors' men, were *Harrold and Another* v. *Watney*, Law Reports, Queen's Bench Division, 1898, p. 320), and *Penny* v. *Wimbledon Urban District Council* (reported in the same volume, p. 213).

His Honour found that there was no negligence on the part of defendants, and gave judgment in their favour.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

Housing in Ireland.—In answer to questions in the House of Commons on Monday, Mr. Acland said the question as to whether any further loans from the Local Loans Fund could be made to local authorities in Ireland during the current year for housing purposes, depended on the demands made on the fund during the next few months, on account of loans already sanctioned.

Kent County Council Workmen's Wages.—The Kent County Council have granted an increase in wages from 1s. to 3s. per week to about 800 of their workmen. The total increase will amount to nearly £4,000 per annum. Mr. A. C. Norman, the chairman of the Bridges and Roads Committee, and Mr. H. T. Chapman, the county surveyor, are stated to have considered each case individually. The allowances in respect of lodging money have also been increased and other concessions made to men working long distances from their homes.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works on which particulars appear below: Buildings—Doncaster, Newport; housing and town planning—Carlisle, Middleton; roads and materials—Ivor, Lewisham; sewerage and sewage disposal—Spalding, Stafford; water, gas and electricity—Highworth, Macclesfield.—Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Alnwick T.C.—Plans have been approved for the erection of a public convenience in Market-place.

Bournemouth T.C.—Two groynes are to be constructed on the beach for the protection of the Undercliff-drive.

Dewsbury T.C.—Plans have been approved for the extension of the borough surveyor's and education departments at the town hall, at an estimated cost of £1,300.

Doncaster T.C.—Provisional plans for new municipal offices have been agreed to. The estimated cost is £30,000, property acquired £5,200, erection of new premises £20,000, equipment £4,800. A recommendation has been adopted to expend £5,300 in additional tramcars, £1,850 in the enlargement of tramcar sheds, £700 in covering the Cheswold, and £500 for other subsidiary works in connection with the tramways. It was also agreed to incur provisional expenditure of £18,000 for an isolation hospital.

Leyton U.D.C.—A scheme has been approved for the erection of a public convenience at the corner of Church-road and Lea Bridge-road.

Neath T.C.—The extension of the Gnoll school, erected at a cost of £10,000, was formally opened recently. The borough engineer, Mr. D. M. Jenkins, prepared the designs, and the work was carried out by Messrs. D. Davies & Son, Cardiff.

Newport (Mon.) T.C.—The latest phase of the much-discussed bridge question was reached on Tuesday, when the council decided to obtain the advice of Mr. Basil Mott, M.Inst.C.E., for which it was agreed to pay a fee of 200 guineas and out-of-pocket expenses.

Paddington B.C.—An estimate of £3,000 has been approved for the adaptation of Woodfield-road wharf as a depot for the storage of materials, according to a plan prepared by the borough surveyor, Mr. E. B. B. Newton.

Shoebury U.D.C.—It was reported that the Joint Hospital Committee had decided to carry out necessary extensions at the Sutton Ford isolation hospital, at an estimated cost of £2,000.

Sleaford R.D.C.—The Local Government Board have refused to grant a loan to the council for the purchase of new offices. At a meeting of the council on Monday it was decided to raise the money out of the rates if necessary.

Sowerby Bridge U.D.C.—Plans have been approved for alterations to the public swimming baths.

HOUSING AND TOWN PLANNING.

Bangor T.C.—It has been resolved to purchase eight houses in Kyffin-square, with a view to erecting workmen's dwellings on the site, and it is hoped to buy other houses in the square for the same purpose.

Bath T.C.—The Baths Committee, in conference with the Surveying Committee, have decided to promote a town planning scheme.

Carlisle T.C.—The council on Tuesday confirmed the proposal of the Health Committee for the erection of thirty-six houses for the working classes, at an estimated cost of £5,582.

Coventry T.C.—Subject to a loan for the work being sanctioned, the council have accepted the tender of Mr. E. Harris, Coventry, at £17,591, for the erection of twenty-one workmen's cottages and seventy-six workmen's flats at Goring-road, Clay-lane, and Stepney-road.

Middleton T.C.—It is proposed to build twenty-four houses on the Boarshaw estate, at an estimated cost of £5,000.

Whitley and Monkseaton U.D.C.—Application has been made to the Local Government Board for sanction to prepare a town planning scheme.

REFUSE COLLECTION AND DISPOSAL.

Westhoughton U.D.C.—The Streets Committee have been authorised to obtain the lease of a site for the installation of a refuse pulveriser.

ROADS AND MATERIALS.

Antrim C.C.—The county surveyor, Mr. David Megaw, reports that in five county districts there are formal proposals intended to make provision for possible unemployment in the neighbourhood of industrial areas, and in three of these the Road Board have given definite promises to assist in case it may be necessary to undertake the works.

Bedwellty U.D.C.—Estimates have been submitted for widening Upper-road, Cwmsyfiog, at an estimated cost of £1,150, and negotiations are to be opened up with the county council and the landowners concerned with a view to obtaining financial support for the scheme.

Cirencester U.D.C.—It has been agreed to expend £1,150 upon the purchase of property at the corner of Cricklade-street for street improvement purposes.

Cork T.C.—The Road Board have sanctioned a grant of £1,000 towards the cost of improving Western-road and Lower Glenmore-road.

Dublin T.C.—The estimates of the Cleansing Committee have been increased by £2,800 for the wages of additional men to be employed in cleansing the streets.

East Molesey U.D.C.—Tenders for ordinary tar at 2½d. per gallon, and refined tar at 3¾d. per gallon, have been accepted from the Kingston Gas Company and Messrs. E. Catchpole & Sons respectively.

East Westmorland R.D.C.—The surveyor, Mr. J. Kilner, reported that he proposed to devote a large portion of the coming summer to the repair of high-lying roads about Little Asby, Whygill Head, and Griseburn. Most of those roads required a lot of metal, as they were too soft to allow of making a passable job in the ordinary way; so he would put in a strong foundation. He would in the meantime get as much stone broken and quarried as he could.

Fareham R.D.C.—A scheme has been adopted for the improvement of the Portsdown Ridge-road, at an estimated cost of £7,000.

Finsbury B.C.—It has been agreed to carry out paving works in Northampton-square.

Gelligaer U.D.C.—An intimation has been received that the Road Board have sanctioned a grant of £3,400 towards the construction of the proposed new road from Pengam to Ystrad Mynach.

Halifax T.C.—The borough engineer, Mr. J. Lord, has received instructions to prepare plans for private street improvement works, and to serve notices on the owners requiring them to carry out the works.

Hereford T.C.—The council have forwarded to the county council plans and estimate (£483) for the improvement of Whitecross-road.

Huthwaite U.D.C.—The tenders of Messrs. James Oakes & Co., for slag, at 4s. 8d. per ton, and the Butterley Company for chippings, at 4s. 9d. per ton, have been accepted.

Kent C.C.—Under the Development and Roads Improvement Act, 1909, it has been decided to make application to the Road Board for a contribution of £49,600 for bituminous carpeting and pitch grouting, for surface improvement. Eight schemes of main road improvement have been forwarded to the board for contributions. The most important of these schemes, by reason of its connection with military stations, is the widening, improving and rounding off of five dangerous corners on the Isle of Grain road near Lower Stoke, for which the land has been given by the owners free of cost, and which it is estimated will require £924 to complete. In this instance the committee have asked the Road Board to contribute the whole cost.—It was reported by the Bridges and Roads Committee that normal work on

the main roads had been impeded by the scarcity of labour, owing to the permanent residents having entered the industrial activities for housing and the military requirements in the district, and at the cost of the War Office through the Road Board of roads used for military traffic. The county surveyor, Mr. H. T. Chapman, with the approval of the committee, was undertaking all such work for the assistance of the military authorities.

Kildare C.C.—The council are applying to the Road Board for a grant of £1,625 and a loan of £1,625 free of interest, for the purpose of steam rolling the Dublin-Limerick road between Naas urban boundary and Leixy bridge at Naas.

Lewisham B.C.—The Finance Committee are giving consideration to a report by the borough engineer, Mr. E. van Praagen, on the question of road construction to be carried out during the ensuing financial year. Mr. van Praagen suggested that certain parts of Brownhill-road, Catford-hill, and Sangley-road and Sandhurst-road should be concreted to a depth of 13 in. below the finished level of the surface and 9 in. of cement concrete laid in trams and when would admit of their being paved with wood at some future time. Money could be borrowed from the county council for the concrete and excavation work over a period of ten years. Torridon-road, Springbank-road, Eltham-road, and portions of Burnt Ash-hill should be concreted. The committee had approved of the following work being undertaken subject to the Finance Committee submitting an estimate and to a loan being obtained as suggested: Brownhill-road, from Rushey Green to Ladbroke-road and from Mirabel-road to No. 337 (including loan charges), £1,143 15s.; Catford-hill, from the corner of Stanstead road to Exbury-road (including loan charges), £866 5s.; Sangley-road and Sandhurst-road up to Muirkirk-road (including loan charges), £1,906 16s.; Torridon and Springbank roads, £945 0s.; Burnt Ash-hill, £1,092 18s.; Eltham-road £208 10s.; total, £6,262.

Sunbury U.D.C.—Carting tenders for the year ending March 31st next have been accepted from Mr. J. H. Scott, for piece work at 1s. 3d. per cubic yard, day work 8s. per day, horse and man to provide cart or water van 8s., unloading 8d. per cubic yard, and for scavenging £135. For granite the tender of the Enderby and Stoney Stanton Granite Company, Limited, Narborough, has been accepted.

Swansea T.C.—A scheme is under consideration for the construction of a new road from Penvilla-road to Bryn-street, Brynhyfryd.

Swindon T.C.—A scheme has been prepared for widening Shaftesbury-road and application has been made to the county council and the Road Board for a contribution towards the cost, estimated at £2,800.

Westhoughton U.D.C.—The council have agreed to take up a loan for the reconstruction of New Brook-road with granite setts, the county council repaying 90 per cent of the interest and repayment, and the surveyor, Mr. George Hayes, has been instructed to prepare plans, sections, and estimates.

Winchester T.C.—Wood block paving is to be laid down at St. Cross, at an estimated cost of £2,000.

Worksop U.D.C.—The surveyor, Mr. G. Rawson, has received instructions to prepare a plan of a proposed improvement in Crown-street.

SEWERAGE AND SEWAGE DISPOSAL.

Banbury R.D.C.—The council have approved schemes for sewerage and sewage disposal works at Great Bourton and Little Bourton, estimated to cost £1,656 and £919 respectively.

Donaghadee U.D.C.—The surveyor has received instructions to report upon the advisability of installing gullies in the streets for the prevention of flooding.

Doncaster R.D.C.—The tender of Messrs. Jonas Rogers & Son, Conisborough, at £4,513, has been accepted for additions to the Conisborough sewage disposal works.

Folkestone T.C.—A scheme has been adopted for the treatment of the sewage from the western outfall at an estimated cost of £1,000.

Lymington R.D.C.—Application is to be made to the War Office for a contribution of £2,000 for the provision of larger purification tanks at Milton, in connection with the scheme for a military hospital.

St. Columb R.D.C.—An intimation has been received from the Local Government Board that they would not be prepared to grant the council's application to borrow £600 for the [illegible] whole village was considered.

Seaford U.D.C.—With reference to the application from the War Office for the [illegible] camp at Seaford, the council resolved that the War Office be informed that the council were prepared to carry out the scheme if the following arrangements were satisfactory to them—viz.: The War Office to contribute £650, and the council to undertake to complete the work within six weeks after the contract was signed, subject to the Local Government Board sanctioning the loan.

Spalding U.D.C.—Revised plans have been approved [illegible] which is £8,000.

Stafford T.C.—The council have adopted the scheme [illegible] borough engineer, Mr. W. Plant.

Worcester T.C.—In order to obtain a test of the engineer's proposal for washing the gravel in the filters at the sewage works, the Water Committee have been authorised to purchase one washing apparatus, with elevator, and to carry out alterations in the pipes of the filters, at an estimated cost of £200.

Wortley R.D.C.—A scheme has been adopted for the improvement of the sewage disposal works at Tankerley, at an estimated cost of £1,020.

WATER, GAS, AND ELECTRICITY.

Aberdeenshire C.C.—The Deeside Committee have [illegible] water pipes in the Aboyne district.

Exeter T.C.—With reference to the application to borrow £10,000 for the carrying out of the Truro Electric Light Order, the Local Government Board have written that the time does not seem very opportune for raising a loan for installing a new electric light undertaking, and asking to be furnished with the council's observations on the point.

Halifax T.C.—The proposal to accept a tender of £33,276 for the erection of carbonising plant at the gasworks was withdrawn at the council meeting held recently.

Highworth R.D.C.—It has been resolved to provide a water supply for Wroughton, including the construction of a reservoir with a capacity of 250,000 gallons.

London C.C.—At the present time the total safe working over load capacity of the plant at the Greenwich generating station, excluding a reciprocating engine which will shortly be dismantled, is 39,000 k.w. To this should be added 3,500 k.w. additional supply about to be obtained from the London Electric Supply Corporation, raising the total capacity to 42,500 k.w. The present load on the station plant is 32,000 k.w., so that the capacity of the spare plant will amount to 10,500 k.w. The Highways Committee are of opinion, however, that in order that more spare plant may be available and additional cars run, a further reserve supply of power of about 4,000 k.w. should be obtained from an outside source. The capital cost of making the connections to enable this additional supply to be provided is estimated at £11,800.

Macclesfield T.C.—A scheme for the improvement of the water supply [illegible] at an estimated cost of £2,000.

Oswestry R.D.C.—A water supply scheme is to be carried out at an estimated cost of £600.

Southampton T.C.—The tender of Messrs. A. C. Potter & Co., London, at £875, has been accepted for new pumping plant for the waterworks.

Stockton T.C.—It is proposed to remodel the carburetted water-gas plant, at an estimated cost of £1,290.

Wigton R.D.C.—The council have adopted the plan prepared by the surveyor, Mr. T. B. Simpson, for the extension of the Westnewton water supply to Howrigg and Crossrigg, at an estimated cost of £320.

MISCELLANEOUS.

Merton U.D.C.—The workmen in the surveyor's department have been granted 1s. a week [illegible] in some cases and in others 2s.

Oldham T.C.—It was stated at the Parks and Cemeteries Committee that a number of trees in the

public streets had died, and a member said this was owing, in some cases, to the trunks having been cut by the guard. The chairman remarked that the guards were an obstruction, and if they killed the trees they were no use. The committee decided to send the matter to the Surveyor's Committee to deal with.

Teddington U.D.C.—The wages of the workmen have been increased by 10 per cent for those receiving less than, and 5 per cent for those receiving over, 30s. per week.

Tiverton R.D.C.—The Devon County Council have written with reference to the utilisation of waste lands, stating that they had been requested by the Board of Agriculture to ascertain particulars of waste lands which might reasonably be expected to repay development. Mr. H. G. New said there was a good deal of waste land at Uffculme, but he did not think the parishioners there would care to have it touched. It was decided to refer the letter to the various parochial committees in the district with a request for particulars on the subject.

PERSONAL.

Mr. T. Hague, surveyor to the Ulverston Urban District Council, has had his salary increased by £25 a year.

Mr. F. Simmonds, junr., of Littlestone, has been appointed surveyor and inspector to the New Romney Town Council.

Mr. P. N. Ginham, an assistant architect under the London County Council, will retire on superannuation at the end of the month.

Mr. G. F. Whitelock, of Scunthorpe, Lincolnshire, has been appointed assistant surveyor to the Langport Rural District Council.

Mr. Edward Sykes, late surveyor to the Cheadle and Gatley Urban District Council, died, we regret to state, on the 5th inst., aged sixty.

Mr. G. H. Sleeman, Torquay, has been appointed clerk of works, and Mr. S. D. Tolliday, Portsmouth, cleansing superintendent to the Exeter Town Council.

Mr. Walter Chamberlain, road foreman to the Chesham Urban District Council, has been appointed to a similar position under the Hertford Corporation.

Mr. P. C. Beeston, assistant in the borough surveyor's department, Hemel Hempstead, has been appointed to a similar position under the Romford Rural District Council.

Mr. C. R. Harding, assistant surveyor to the Langport Rural District Council, has been appointed assistant highway surveyor to the Williton (Somerset) Rural District Council, and will take up his new duties on April 5th.

Mr. Frederick Silcock, aged thirty-one, assistant foreman for the past two years under the Bedford Corporation, was on Monday appointed, out of fifty-nine applicants, as road foreman to the Teddington Urban District Council.

Mr. Richard Olver, surveyor to the Launceston Rural District Council, died, we regret to state, last week, aged sixty-eight. His son William has just been elected assistant county surveyor for the Eastern part of Cornwall under the Cornwall County Council, while his other son, Sydney, who lives at Bovey Tracey, is surveyor under the Newton Abbot Rural District Council.

Messrs. H. Howard Humphreys, Westminster, and J. Moncur, county surveyor, Staffs, have been transferred from the class of associate-member to that of member of the Institution of Civil Engineers. Messrs. W. A. Niven, municipal waterworks, Bombay, H. Serridge, borough engineer's department, Durban, and J. A. Staddon, council offices, Watford, have been elected associate-members of the same body.

Mr. R. O. Wynne-Roberts, consulting engineer to the city of Regina, Saskatchewan, has resigned his position owing to the suspension of works due to financial stringency accentuated by the war, and we understand that he will terminate his duties on May 31st next. Mr. Wynne-Roberts has been in Regina for three and a-half years, and during that time has been engaged on waterworks research, development and execution, stockyards and abattoirs, natural gas supply, and other works. He reported to the Provincial Government on a large scheme of power development on the extensive lignite fields, and has been consulted by several local authorities in connection with water supply and other matters. Mr. Wynne-Roberts' impressions of municipal engineering, both in the United States and Canada, are contained in a letter which we recently received from him. "Sewage Disposal, water purification and general construction are," he says, "on a large scale, and the methods are in many ways different, and yet on basic principles are alike, to British. Low temperatures in winter—sometimes as low as 55 deg. Fahr. below zero—and high temperatures in summer—such as 100 deg. Fahr.—are conducive to disintegration, and the problem often is how to counteract atmospheric influences. Moreover, periods of construction in northern latitudes are shorter and more intensive than in the old country, and consequently the methods adopted are in some respects different. Machine trenching and excavation, and other mechanical means for expediting the execution of earthworks, concrete mixing and chuting by various means are in vogue. Compressed-air mixing and chuting is in use in certain places, and concrete conveyed under pressure through pipes is to be seen on bridge work in this province. There are many interesting points in North American engineering which could be studied with advantage by British contractors." Mr. Wynne-Roberts' future plans are not yet decided upon.

The deputation which, at the last meeting of the executive council of the County Councils Association, was appointed to wait on the Chancellor of the Exchequer to urge the desirability of the Road Board continuing its annual grants towards road reconstruction and road crust improvements in the counties will, we learn, consist of the chairman (Lord St. Aldwyn), the Right Hon. H. Hobhouse, Sir W. Ryland, Mr. D. Atkins, M.P., Mr. H. Barber, Mr. A. C. Pain and Mr. H. T. Wakeham (county engineer of Middlesex).

QUERIES AND REPLIES.

We cannot undertake to reply to any queries which are not accompanied by the writer's name and address. These are required as a guarantee of good faith, and not for publication. Sketches accompanying queries should be made separate, on white paper, in plain black ink lines. Lettering or figures should be bold and plain.

Well Boring, Book on. "W. K." inquires for a book by an authority on deep well boring for water supplies, and particularly on the working of the plant used in this work.

Probably the only authoritative book on the subject is "Well Boring for Water, Brine and Oil: A Manual of Current Practice," by C. Isler, hydraulic engineer, second edition, 1911, 10s. 6d. nett.

Calculation of Superficial Areas.—"H. S." writes: Will you inform me whether there has come to your notice a ready reckoner for calculating superficial areas? The ordinary reckoners, as used by glass and timber merchants, only calculate up to a few feet square, and what I want is one that will compute, say, any measurement, progressing by inches, up to about 100 ft. square. If there is a work of this description on the market, I should be pleased to learn of it, as it would considerably facilitate many calculations I have to make daily in squaring out large dimensions of paving, flagging, &c.

The "Radial Area Scale," made by Messrs. Morgan & Kidd, Kew Foot-road, Richmond, Surrey, will probably suit. The price is 3s. 6d. There is also an instrument called the "Areameter" (Reg. No. 65727), but we cannot ascertain where it is obtainable.

FOR OTHER ADVERTISEMENTS
See End of Paper.

BOROUGH OF HEMEL HEMPSTED.
General Assistant wanted immediately in the office of the Borough Surveyor and Waterworks Engineer.
Salary commencing at £80, rising to £100 by annual increments of £5 on approved service.
Forms of application may be obtained from the Borough Surveyor.
Town Hall,
Hemel Hempsted.
March 10, 1915. (2,468)

UNIVERSITY OF LIVERPOOL.

FACULTY OF ARTS.

CHAIR OF CIVIC DESIGN.

The Council invite applications for this Chair, which is associated with the School of Architecture. Salary £400. Residence required from 1 October to 31 March. Professional practice allowed on conditions. Duties to begin 1 October, 1915. Applications, together with the names of three persons to whom reference may be made, and twelve copies of not more than six testimonials, should be forwarded to the undersigned on or before 10 May, 1915. Further particulars regarding conditions and duties may be had on application.

EDWARD CAREY,
Registrar.

(2,472)

BOROUGH OF DARLINGTON.

The Darlington Corporation invites applications for the appointment of

1. A Junior Assistant in the Office of the Borough Surveyor and Waterworks Engineer, at a salary of £90, rising by annual increments of £10 to £110 per annum.

2. A Temporary Architectural Assistant, at a salary of £2 10s. per week for a period of six months.

Applications, in candidate's own handwriting, on Forms which may be obtained from Mr. George Winter, Borough Surveyor, Town Hall, Darlington, accompanied by copies of not more than three recent testimonials, should be properly endorsed and sent to him not later than Monday, the 22nd March instant.

Canvassing strictly prohibited.

HY. G. STEAVENSON,
Town Clerk.

Houndgate,
Darlington,
March 9, 1915. (2,471)

TEDDINGTON URBAN DISTRICT COUNCIL.

CLERK OF WORKS.

The above-named Council require the services of a Clerk of the Works for a period of about nine months to superintend the construction of Concrete Tanks and Filters at their Sewage Works.

Candidates must have had experience in a similar capacity and supervised works of a like character.

Salary £1 4s. per week.

Applications, endorsed "Clerk of Works," stating age and experience, accompanied by copies of three testimonials (which will not be returned) to be sent to the undersigned not later than Saturday, the 20th instant.

Canvassing Members or Officials will be disqualified.

By order,

G. H. SALMONS,
Clerk.

Council Offices,
Teddington.
March 10, 1915. (2,470)

WILTS COUNTY COUNCIL.

COUNTY SURVEYOR'S DEPARTMENT.

Required, a Second Class Clerk. A good Shorthand Writer and Typist. Salary commencing at £60 per annum, rising by annual increments of £5 to £100 per annum. Age 18 to 25.

Form of Application to be obtained from the undersigned must be sent in on or before March 19th.

J. GEORGE POWELL,
County Surveyor.

County Offices,
Trowbridge.
February 23, 1915. (2,469)

BOROUGH OF TIVERTON.

WANTED, WATER FITTER AND TURNCOCK.

Wages 30s. a week. Applicants must be competent Fitters, and with a knowledge of the working of water waste detecting meters.

Further particulars may be obtained from the undersigned, to whom applications, endorsed "Water Fitter," accompanied by copies of not more than three recent testimonials, are to be sent not later than the 27th instant.

J. SIDDALLS,
Borough Surveyor.

Town Hall,
Tiverton.
March 10, 1915. (2,460)

WATFORD URBAN DISTRICT COUNCIL.

HIGHWAY SUPERINTENDENT.

The Council is prepared to consider applications for the position of Highway Superintendent to act under the instructions of the Engineer and Surveyor to the Council, at a salary of £180 per annum, rising by annual increments of £10 to a maximum of £200.

Applicants must be between the ages of 25 and 40 years.

Forms of application and the terms and conditions attaching to the appointment may be had of the undersigned, to whom applications, with copies of three testimonials, must be sent in not later than 9 a.m. Wednesday, 24th March, 1915.

Canvassing any Member of the Council, either directly or indirectly, will disqualify.

W. HUDSON,
Clerk and Solicitor.

Council Offices,
14 High-street,
Watford,
Herts.
March, 1915. (2,466)

KINTYRE DISTRICT.—Interim Road Surveyor wanted immediately for the period of War. Salary at the rate of £250 per annum, to cover all travelling expenses, including the provision, upkeep and running of a motor car or motor cycle. Two copies of testimonials, on or before 23rd instant, to the Clerk, Kintyre District, Campbeltown. (2,464)

BOROUGH OF CONGLETON.

SURVEYOR'S JUNIOR ASSISTANT.

Applications are invited for the temporary appointment during the War of a Junior Assistant in the Surveyor's Department.

Applicants must be neat Draughtsmen, and have a knowledge of levelling, building construction, surveying, drainage [illegible] and will be required to assist the Surveyor generally during the absence of the Sanitary Inspector on active service.

Applications, in candidate's own handwriting, stating age, experience and salary required, accompanied by copies of not more than two recent testimonials, and giving date on which the applicant can commence his duties, must be received by me not later than Monday, 29th March, 1915, endorsed Junior Assistant.

J. H. WALTERS,
Borough Surveyor.

Town Hall, Congleton. (2,462)

COUNTY BOROUGH OF DEWSBURY.

TEMPORARY ENGINEERING ASSISTANT.

Wanted in the Borough Surveyor's Office, a thoroughly Competent Assistant. Applications, stating age, experience, and salary required, to be in my hands not later than the 23rd inst.

HENRY DEARDEN, Assoc.M.Inst.C.E.,
Borough Surveyor.

Town Hall, Dewsbury.
March 9, 1915. (2,459)

GREAT CROSBY URBAN DISTRICT COUNCIL.

The above Council are prepared to receive Tenders for the Supply of the following Materials during the year ending March 31st, 1916, in such quantities and at such times as may be ordered:—

1. Granite Macadam and Chippings.
2. Limestone Chippings.
3. Tarred Limestone Macadam.
4. Portland Cement.
5. Stoneware Pipes, &c.
6. Disinfectants.
7. Pitch and Tar.
8. Incandescent Mantles and Chimneys.
9. Glass for Street Lamps.
10. Horse Provender.
11. Granite Setts.
12. Extra Cart Hire.

Specifications can be obtained from Mr. Joseph A. Wright, Surveyor, Council Offices, Coronation-road, Great Crosby.

Sealed and endorsed Tenders to be delivered to the Council Offices by noon, on March 24th, 1915, addressed to the "Chairman of the Council."

The lowest or any Tender not necessarily accepted.

JOSIAH DEAN,
Clerk to the Council.

March 3rd, 1915. (2,465)

TO PAVING CONTRACTORS.

RICHMOND BRIDGE AND APPROACHES.

REPAVING OF ROADWAY WITH GRANITE.

The Richmond Bridge Commissioners are prepared to receive Tenders for the Repaving with Granite of the Roadway of Richmond Bridge and its Approaches from Hill-street on the Richmond side to the foot of the hill opposite Willoughby-road on the Twickenham side.

The Contract Drawing, Specification, Schedule of Quantities, and Form of Tender may be seen at the Offices of the Clerk to the Commissioners, 24 Hill-street, Richmond, Surrey, or at the Offices of the Engineer, Mr. E. Cruttwell, 2 Queen Anne's-gate, Westminster, on and after Wednesday, 17th March, between the hours of 11 and 4; and copies of the same may be obtained at either office upon payment of Five Guineas, which will be returned upon receipt of a *bonâ-fide* Tender.

Tenders, endorsed "Tender for Repaving," must be delivered under seal at the Offices of the Clerk to the Commissioners, 24 Hill-street, Richmond, Surrey, on or before noon on Wednesday, 31st March next.

The Commissioners do not bind themselves to accept the lowest or any Tender.

J. LESLIE G. POWELL,
Clerk to the Commissioners.

March 10, 1915. (2,474)

URBAN DISTRICT COUNCIL OF WOODBRIDGE.

The above Council invite Tenders for the Supply of 200 tons of Broken Granite, 1½-in. gauge, to be delivered, carriage paid, to Woodbridge (G.E.R.) Station.

Tenders, accompanied by Samples, to be delivered (carriage paid) to Mr. Walter Brooke, Council Offices, Woodbridge; endorsed "Tenders for Granite," on or before the 25th day of March, 1915.

W. GROUT WHISSTOCK,
Surveyor.

Woodbridge.
March 11, 1915. (2,461)

BOROUGH OF GUILDFORD.

The Town Council invite Tenders for the Supply of the following Materials, &c., for a period of 12 months, ending 31st March, 1916:—

Schedule No.
1. Tar-macadam, Broken Granite, Best Basket Slag, and Chippings.
2. Brooms and Brushes.
3. Cast-iron Pipes.
4. Flints.
5. Galvanised Steam Tubes.
6. Disinfectants.
7. Horse Hire and Cartage.
8. Iron Castings.
9. Ironmongery.
10. Lubricating and other Oils, &c.
11. Pitch and Tar.
12. Portland Cement and Lias Lime.
14. Stoneware Pipes, &c.
15. Shoeing, Sharpening Picks, &c.
17. Saddlery, and Harness Repairs.

In the case of Tenders for the Supply of Oils (Schedule No. 10), alternative prices must be quoted for a supply of 3 months, commencing the 1st April, 1915.

All particulars, Specifications, Schedules and Forms of Tender may be obtained on application to the Borough Surveyor, Mr. E. Young Harrison, ASSOC.M.INST.C.E., Tuns Gate, Guildford.

Tenders (each enclosed in a sealed envelope, endorsed "Tender for ——") must be delivered to me, the undersigned, before 12 noon on Monday, March 29th, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

A. D. JENKINS
Town Clerk.

Town Clerk's Office,
Bridge-street, Guildford.
March 10, 1915. (2,463)

CARSHALTON URBAN DISTRICT COUNCIL.

TAR-SPRAYING ROADS.

Tenders are invited for Treating about 90,000 yds. super. (more or less) of Road in this District with Bituminous Dust-preventing Material which will not be harmful to Fish or Vegetation in the Streams into which the surface water runs.

An indemnity to this effect will be required.

Tenders are also invited for Treating about 50,000 yds. super. (more or less) of Road with Best Refined Tar, applied at a temperature of 230 deg. Fahr.

The price in each case to be at per yard, the preliminary work of surface preparation and the after treatment being carried out by the Council. Full details of the Materials to be used, and the method of application, whether by hand or machine, should be supplied.

Tenders, addressed to the Chairman of the Council, marked "Tender for Tar-spraying," to be delivered at this Office not later than 12 noon on Wednesday, 24th March, 1915.

The Council do not bind themselves to accept the lowest or any Tender, and the persons whose Tenders are accepted will be required to enter into the usual contract and bond, which may be seen at this Office.

(By order)
E. W. MORLEY,
Acting Clerk.

District Council Offices,
The Square, Carshalton.
March 11, 1915. (2,473)

ALDERSHOT URBAN DISTRICT COUNCIL.

TENDERS FOR ROAD MATERIALS.

The above Council are prepared to receive Tenders for the Supply of the following:—

Asphalt or Bitumen for road grouting purposes, at per gallon.

6,000 gallons (more or less) Bitumen for road surfacing.

200 tons Slag Tarmac.
120 tons 1½-in. and ¾-in. Tar Paving.
1,000 tons Welsh, Shropshire, or Devon Basalt.
400 yards 2½-in. Red Hungry Hill Flints.
All f.o.r. Aldershot Town Station.

No special Tender Form is needed, but each Firm tendering must state when they can deliver material.

Tenders, endorsed "Road Material," to be sent to W. E. Foster, Esq., Clerk to the Council, not later than 5 p.m. on Tuesday next, 16th March, 1915.

The Council will not necessarily accept the lowest or any Tender that may be sent in.

Municipal Buildings,
Aldershot.
March 10, 1915. (2,458)

THE URBAN DISTRICT COUNCIL OF WIMBLEDON.

TENDERS FOR MATERIALS, FODDER, &c.

The Council are prepared to receive Tenders for the Supply of the following:—

During year to 31st March, 1916.

ROAD MATERIALS.

1½-in., 2-in. and 2½-in. Leicestershire or other Granite, Granite Chippings, Quartzite, Tar-macadam, Tar Paving, Farnham Hungry Hill Flints, Fine Footpath Gravel.

CARTING, &c.

Carting of Road Materials, Day-work Carting.
Hire of a 10-ton Steam Roller.

During half-year to 30th September, 1915.

Oats, Hay, Straw, & Chaff for the Council's Stables, Bagshot.

Shoeing the Council's Horses.

Forms of Tender and other particulars may be obtained of Mr. W. Dickinson Bell, Surveyor, Council Offices, Bagshot.

Sealed Tenders, marked "Tender for ——," must be delivered to me, the undersigned, not later than 12 noon on Wednesday, the 24th day of March, 1915.

The Council will not be bound to accept any Tender.

EDWYN T. CLOSE,
Clerk of the Council.

Council Offices,
Bagshot.
March 10, 1915. (2,467)

WATER SUPPLY IN THE BERMUDAS.

HOUSE ROOFS AS CATCHMENT AREAS.

The water supply [illegible] the Bermudas [illegible] Mr. G. Bertram Kershaw in a paper read [illegible] Institute of Sanitary Engineers. [illegible] engineering [illegible] Bermuda, [illegible] underground water [illegible] Hamilton, [illegible] contain as much as 100 parts of chlorine per 100,000 [illegible] caused [illegible] drinking purposes. [illegible] Hamilton [illegible] environments [illegible] underground water [illegible] caused by seepage from the large number of cesspools [illegible] on the rock. Boring operations [illegible] water [illegible] found at Paget [illegible] no water was obtained [illegible] a depth of 1,400 ft. [illegible] been pushed [illegible] boring was suspended. All the rock [illegible] the islands are [illegible] with shallow wells about [illegible] ft. high, running [illegible] the level of the [illegible] sinking and [illegible] which [illegible] on them [illegible] pipe connected with the rain water storage tank or tanks.

The [illegible] are [illegible] of cut [illegible] the solid rock [illegible] and not [illegible] although [illegible] concrete [illegible] ing the water being [illegible] to pumps when required [illegible] to [illegible] for the purpose. The larger houses have additional "catches," as they are locally termed, formed by cutting the rock on higher ground, excavating a flat surrounding gutters at the [illegible] point leading to the storage tank. Sometimes the catch is rendered with cement, and it may be mentioned that the limestone takes rendering excellently.

The water is not, as a rule, filtered before use, and if used for drinking purposes is almost invariably boiled. It must be borne in mind, in connection with the [illegible] of the paper, that [illegible] are needed [illegible] and consequently there is little [illegible] to be reckoned with.

The capacities of [illegible] water tanks [illegible] vary greatly, even in the case of [illegible] houses, according to the means and individuality of the owner. In some cases they have a capacity of several thousand gallons, but, generally speaking, they are not large enough.

The water, in Mr. Kershaw's opinion, should certainly invariably be carefully filtered before being drunk. [illegible] should be applied [illegible] to the water [illegible] rain [illegible] drinking purposes, and not placed in it.

The [illegible] water used per head [illegible] varies [illegible] considerably, [illegible] that with the exception of the hotels and the larger houses, the quantity was little, if anything, in excess of [illegible] per head per day when there were no baths. In the case of the larger hotels, however, which are largely patronised by Americans, the amount of water used per head per day is [illegible] ten times this quantity.

A Glossary of Road Terms (By H. Percy Boulnois, M.INST.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

Flies and Mosquitoes. Mosquitoes and flies are unfortunately [illegible] observed Mr. G. Bertram Kershaw at last week's meeting of the Institute of Sanitary Engineers, [illegible] common in Bermuda, and both *Anopheles* and *Stegomyia* mosquitoes are plentiful. The larvæ, or "wiggle-tails," can be seen at the surface of most wayside pools. Something towards destroying the insect in the larval stage has been effected by kerosene poured on to such stagnant pools. Fish will feed greedily upon the larvæ, and in some of the West Indian islands natives sometimes keep one or two small fish of the "top minnow" variety in their drinking-water cisterns—not, however, with the idea of keeping down mosquito larvæ, but with a view to ascertaining whether any of their friends or relatives have poisoned the water. The common housefly occurs in very large quantities, and doubtless plays a very considerable part in disseminating disease. A mixture of formalin and water, to which a little sugar had been added, proved an irresistible attraction to the flies, half a dustpan full of flies being swept up shortly after the plates containing the mixture had been put down.

RUNNING COSTS OF MOTOR VEHICLES.

PAPER AT THE SOCIETY OF ENGINEERS.

Lieut. Robert W. A. Brewer, ASSOC.M.INST.C.E., [illegible] read [illegible] a paper on "Running Costs of Motor Vehicles," read before the Society of Engineers on the 1st inst, stated that the problem before the automobile engineer was to transport persons and goods in a minimum of time and at a minimum cost. The second consideration was, perhaps, the more important, and could be profitably discussed from an engineering standpoint. The main heads under which expenses might be classified were: [illegible]

As regarded fuel cost, it could not be said that a powerful engine was proportionately a greater fuel consumer than a similar one of less power, and the author discussed the factors producing economy in the use of fuel. The question of efficient lubrication was of the highest importance, but little progress had yet been made, and further experiments were necessary. Piston friction also required more investigation, the most suitable form and material and the appropriate number of rings for a given type of car being yet undecided; attention was also directed to the problem of piston clearance. In valve mechanism there was little room for improvement, but the transmission losses had not yet been reduced to a minimum.

Gas friction caused loss due to the reduction of the volumetric efficiency of the engine, and efficient carburation played an important part in reducing loss from this cause, while changes of direction of flow should be made as easy as possible. At all diversions of the flow path a sufficiently high wall temperature must be provided to prevent precipitation. It was not so much the quantity of heat as its application at the correct points that was of the highest importance.

The author criticised the usual method of conducting fuel consumption tests, and indicated the importance of using an accelerometer when making such tests. The variation of the power required to drive a car was due largely to wind and rolling resistances. Total car resistance was also influenced by the balance of the wheels, engine parts, and propeller shafts.

UCKFIELD COUNCIL AND THE MILITARY AUTHORITIES.

[illegible] Uckfield Rural District Council on Monday a letter was received (as reported by [illegible] from Lieutenant-Colonel Walters, the officer commanding the 1st London Division Royal Engineers, at Crowborough Camp, in the following terms: "With reference to previous correspondence regarding your surveyor entering on War Department premises at the Beacon, and your claim to allow him to do so, I now beg to call your attention to the Public Health Act, 1875, 38 and 39 Vic., Cap. 55, which says: 'Nothing in this Act shall be construed to authorise any local authority to disturb or interfere with any lands or other property vested in H.M. Principal Secretary of State for the War Department for the time being without consent, in every case, of such Secretary of State, such consent to be expressed in writing.'"

The clerk explained that this was a case where the military authorities laid a drain to the council's sewer without their consent. Hearing that their sanitary surveyor, Mr. J. Taylor, examined the sewer to see if it was connected up properly, the military complained that he had no right to interfere in the matter. The section quoted by Lieutenant-Colonel Walters did not give the military power to lay a drain to the council's sewer.

The chairman (Major R. L. Thompson): I think we had better leave it to the clerk to fight out.

The clerk suggested that all the council need do was to write pointing out that the military had no power to connect a drain to their sewer without consent.

This course was adopted.

Treatment of Damp Walls.—We are informed that the walls of the police station at Worcester, which were frequently damp, have been completely cured by a rendering of Pudlo cement.

DAMAGE TO ROADS BY HEAVY MOTORS.

EXPERT COMMITTEE APPOINTED.

It is officially announced that, in view of the complaints which have been made as to the alleged excessive damage caused to roads by certain classes of heavy motors and locomotives, the Right Hon. Herbert Samuel, M.P., President of the Local Government Board, has appointed a small expert committee to inquire into the sufficiency of the existing requirements with respect to the construction of these vehicles, including weights on wheels, widths of tyres, diameters of wheels, &c. The terms of reference are: "To consider the law and regulations relating to the construction and use of road locomotives and heavy motor cars in Great Britain, and to report what amendments, if any, are desirable." The committee will consist of:—

Mr. E. Shortt, K.C., M.P. (chairman);
Mr. A. G. G. Asher, county clerk of Midlothian;
Mr. P. M. Crosthwaite, M.INST.C.E., engineering inspector to the Local Government Board;
Mr. H. Howard Humphreys, ASSOC.M.INST.C.E., a well-known road engineer and witness at Local Government Board inquiries held into the proposed closing of roads against heavy traffic;
Mr. E. J. Lovegrove, M.INST.C.E., borough surveyor of Hornsey;
Mr. J. E. Thornycroft, ASSOC.M.INST.C.E.;
Mr. J. Willmot, F.S.I., county surveyor of Warwickshire;

with Mr. R. J. Simpson, of the Local Government Board, as secretary.

In connection with the general question of the user of roads by heavy motors, it is understood that a joint select committee to consider questions relating to contributions by motor omnibuses to the cost of road maintenance is also contemplated.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

EASTERN DISTRICT.

An Eastern District meeting will be held at the offices of the Institution, 92 Victoria-street, Westminster, S.W., to-morrow (Saturday).

4 p.m.—Meeting of Executive Committee.

AGENDA.

(1) To consider annual report.
(2) Suggestions for arrangements of future meetings.

4.30 p.m. Meeting of the members of the Eastern District.

AGENDA.

(1) Minutes of previous meeting held at Tilbury.
(2) Election of Executive Committee.
(3) Election of Chairman.
(4) Election of district representatives.
(5) Election of honorary secretary.
(6) Suggestions as to arrangements for future meetings.
(7) A discussion on the use of bituminous [illegible] in road construction.

SOUTH WALES DISTRICT.

A South Wales District meeting will be held at City Hall, Cardiff (by the kind consent of the Cardiff Corporation), on Saturday, March 27th, at 2.15 p.m.

AGENDA.

(1) To read the minutes of the last meeting.
(2) To elect a district secretary.
(3) To receive nominations for district representative.
(4) To elect a district chairman.
(5) To elect a district executive committee.
(6) Paper by Mr. D. M. Jenkins (member), Neath: "Notes on Extraordinary Traffic on Highways."
(7) Other business, if any.

H. ALEX. CLARKE.
Hon. District Secretary.

Briton Ferry.

Glasgow Town Planning Schemes.—The town planning scheme of the Glasgow Corporation was the subject of an inquiry conducted recently in the City Chambers by Mr. Walker Smith, on behalf of the Local Government Board for Scotland. The scheme embraces lands in the districts of Kelvinside, Temple, Jordanhill, Broomhill, Whiteinch, Scotstoun, Yoker (East), Drumchapel, Scotstounhill, and Knightswood, and includes in its main features the construction of a wide thoroughfare from Anniesland to Clydebank burgh boundary. Part of the area is situated in Dumbartonshire, and another part in Renfrewshire, and the local authority in each county, who have competing town planning schemes, are the principal objectors. Evidence was given by Mr. Thomas Nisbet, master of works, Glasgow, Mr. David Dunbar, sanitary inspector for the county of Dumbarton, and Mr. James M. Low, surveyor for the Upper District of Renfrew.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of* SITUATIONS. *Such advertisements may, in cases of emergency only, be telephoned (City No. 7070) subject to later confirmation by letter.*

TEMPORARY TOWN PLANNING ASSISTANT.—March 15th.—Hazel Grove and Bramhall Urban District Council. £2 5s. per week.—Mr. G. Severn Doncaster, surveyor, Public Offices, Hazel Grove.

WORKS SUPERINTENDENT.—March 15th.—West Ham Town Council. £250 per annum.—Mr. J. S. D. Moffat, tramways manager, Tramway Offices, Greengate-street, Plaistow, E.

SUPERINTENDENT OF HIGHWAYS AND GENERAL FOREMAN.—March 15th.—West Hartlepool Town Council. £156 a year.—Mr. Nelson F. Dennis, borough engineer, Municipal Buildings, West Hartlepool.

SANITARY INSPECTOR.—March 15th.—Ardsley East and West Urban District Council. £80 per annum.—Mr. E. H. Middlebrook, clerk, 71 Queen-street, Morley, near Leeds.

TEMPORARY ARCHITECTURAL ASSISTANT.—March 15th.—Huddersfield Town Council. £120 per annum.—Mr. K. F. Campbell, borough engineer, 1 Peel-street, Huddersfield.

MECHANICAL ENGINEER.—March 16th.—North Bromsgrove Urban District Council.—Mr. Francis T. Levens, clerk, 110 High-street, Bromsgrove.

COUNTY SURVEYOR.—March 20th.—Notts County Council. £500 per annum.—Mr. H. Hampton Copnall, clerk, Shire Hall, Nottingham.

CLERK OF WORKS.—March 20th.—Blaenavon Urban District Council. £130 per annum.—Mr. I. G. G. Thomas, clerk.

CLERK OF WORKS.—March 20th.—Rothwell Urban District Council. £3 per week.—Mr. W. Dodgson, clerk, Council Offices, Rothwell, Leeds.

ASSISTANTS.—March 22nd.—Darlington Town Council. £90—£110 per annum.—Mr. G. Winter, borough surveyor.

TEMPORARY ARCHITECTURAL ASSISTANT.—March 22nd.—Darlington Town Council. £2 10s. per week.—Mr. G. Winter, borough surveyor.

BOROUGH ENGINEER AND SURVEYOR.—March 22nd.—Corporation of Mansfield. £400—£600 per annum.—Mr. J. Harrop White, town clerk.

CLERK DRAUGHTSMAN.—March 23rd.—East Suffolk County Council. £90—£120 per annum.—Mr. W. Jervis, county road surveyor, County Hall, Ipswich.

BOROUGH SURVEYOR AND ENGINEER.—March 24th.—Corporation of Stockton-on-Tees. £500—£700.—Mr. Arthur B. Crosby, town clerk, Borough Hall, Stockton-on-Tees.

SANITARY INSPECTOR.—March 25th.—Sutherland County Council. £120 per annum.—Mr. A. Argo, county clerk, Golspie, Sutherlandshire.

SURVEYOR OF HIGHWAYS.—March 25th.—Abingdon Rural District Council. £2 10s., to a maximum of £150.—Messrs. B. & E. M. Challoner, clerk, 67 Stert-street, Abingdon.

ASSISTANT ENGINEERS.—April 1st.—Indian Public Works and State Railways Departments.—Secretary, Public Works Department, India Office, London, S.W.

DRAUGHTSMAN.—Nigerian Government Railway. £300–£360 per annum. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

DRAUGHTSMEN.—Sierra Leone Government, Public Works Department. £300–£350. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

TEMPORARY CLERK.—Acton Urban District Council. £3 3s. per week. Mr. F. Sadler, surveyor, Council Offices, Acton, W.

ASSISTANT ENGINEERS.—Public Works Department, Gold Coast. £350–£400. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency, be telephoned (City No. 1056) subject to later confirmation by letter.*

GALLMIRE.—Designs for a small hospital, for the Galemire (Whitehaven) Joint Hospital Committee.—Mr. E. B. Croasdell, clerk, Union Hall, Whitehaven.

STEPNEY.—Designs for municipal buildings, for the borough council. Mr. H. T. Hare, F.R.I.B.A., has been appointed assessor.—Mr. G. W. Cutler, town clerk, 15 Great Alie-street, Whitechapel.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency, be telephoned (City No. 1056) subject to later confirmation by letter.*

Buildings.

EAST SUFFOLK.—March 16th.—For the erection of a hospital, for the county council.—Mr. H. M. Conlin, architect, The Thoroughfare, Butter Market, Ipswich.

MORLEY.—March 16th.—For the erection of a coal store at the gasworks, for the corporation.—Mr. F. Turner, town hall, Morley.

HUDDERSFIELD.—March 17th.—For the erection of a storage shed at the tramway depot, for the corporation.—Mr. K. F. Campbell, borough engineer and surveyor.

HAMPSHIRE.—March 17th.—For the erection of a school, for the county council.—Mr. A. L. Roberts, architect, The Castle, Winchester.

OLDHAM.—March 18th.—For the erection of a rubble retaining wall, for the corporation.—Borough Surveyor.

GLASGOW.—March 18th.—For the erection of a school, for the School Board.—Master of Works, 129 Bath-street, Glasgow.

CARDIFF.—March 18th.—For the supply and erection of a shed, for the corporation.—City Engineer.

DARLINGTON.—March 18th.—For the extension of the electric power station, for the corporation.—Mr. G. Winter, borough surveyor.

WALLASEY.—March 18th.—For the erection of workshop and men's room, and the construction of foundation for gas engine, for the corporation.—Mr. J. H. Crowther, engineer and manager of the gasworks, Limekiln-lane, Wallasey.

READING.—March 18th.—For the erection of a public convenience, for the corporation.—Mr. J. Bowen, borough engineer and surveyor.

DONCASTER.—March 19th.—For the extension of the reservoir, for the rural district council.—Mr. W. R. Crabtree, surveyor.

HEMSWORTH.—March 20th.—For laying water mains, for the rural district council.—Mr. T. H. Richardson, engineer, Hemsworth.

STEVENAGE.—March 22nd.—For the erection of eight cottages, for the urban district council.—The Surveyor.

TUNBRIDGE WELLS.—March 22nd.—For the erection of an engine-house and engine foundations, for the corporation.—Mr. W. H. Maxwell, borough waterworks engineer.

MONMOUTH.—March 22nd.—For the erection of a domestic arts centre, for the Education Committee.—Mr. J. Bain, County Council Offices, Newport, Mon.

CHELMSFORD.—March 22nd.—For the erection of an engine-house and incidental works, for the corporation.—Mr. P. T. Harrison, borough engineer.

DROMORE.—March 23rd.—For the erection of twenty-one cottages, for the rural district council.—Mr. N. Naughton, clerk.

EPSOM.—March 23rd.—For the erection of ten cottages, for the rural district council.—Mr. A. C. Williams, architect and surveyor, Council Offices.

SOUTHALL-NORWOOD.—March 23rd.—For the erection of fifty-four houses, for the urban district council.—Mr. R. Brown, engineer and surveyor, Southall.

SHEFFIELD.—March 24th.—For the erection of public conveniences in various parts of the city, for the Health Committee of the Sheffield City Council.—Mr. Charles F. Wike, city engineer, Town Hall.

MANCHESTER.—March 24th.—For the erection of baths, for the Baths Committee.—City Architect, Town Hall.

NORTHAMPTON.—March 25th.—For the erection of twenty cottages, for the corporation.—Waterworks Office, Fish-street, Northampton.

SPALDING.—March 27th.—For the erection of three cottages and outbuildings, for the rural district council.—Mr. H. Dowse & Crowder, architects, 6 Double-street, Spalding.

CARMARTHEN.—March 31st.—For the erection of a school, for the county council.—Mr. W. V. Morgan, county architect, County Education Offices, Carmarthen.

ANGLESEY.—April 7th.—For the erection of new schools, for the Education Committee.—Mr. J. Owen, county architect, Menai Bridge.

Iron and Steel.

COVENTRY.—March 15th.—For the supply of cast-iron pipes, steel pipes, and bends and valve boxes, for the corporation.—The Water Engineer, St. Mary's Hall, Coventry.

CHELMSFORD.—March 17th.—For the supply of pumping machinery, and for the provision and erection of a pumping installation, complete with all incidental works, for the corporation.—Mr. Percival T. Harrison, borough engineer.

DARLINGTON.—March 18th.—For the construction of two dry-lute purifiers at the gasworks, for the corporation.—Mr. F. P. Tarratt, gasworks engineer.

WALLASEY.—March 18th.—For the supply and delivery at the gasworks and coke-screening plant at the gasworks, for the corporation.—Mr. J. H. Crowther, engineer and manager, Limekiln-lane, Wallasey.

HEMSWORTH.—March 20th.—For supplying and laying cast-iron mains, for the rural district council.—Mr. T. H. Richardson, engineer, Hemsworth.

BELPER.—March 25th.—For providing and laying cast-iron pumping main, for the urban district council.—Messrs. G. & F. W. Hodson, Bank Chambers, Loughborough.

CARMARTHEN.—March 26th.—For providing and laying water mains, for the rural district council.—Mr. W. E. Jones, surveyor, Rock Hill, Llanarthney.

Roads.

BRADFIELD.—March 15th.—For the repair of the district roads, for the rural district council.—Mr. B. A. Collins, clerk, 172 Friar-street, Reading.

LLANFRECHFA UPPER.—March 15th.—For road metalling and hauling, for the urban district council.—Mr. T. Titley, deputy surveyor, Commercial-street, Pontnewydd.

LANARK.—March 15th.—For executing works of granolithic paving, kerb and channel, for the District Committee of the Middle Ward.—Mr. R. Spittal, road surveyor, District Offices, Hamilton.

PLYMOUTH.—March 15th.—For making up several streets, for the corporation.—Mr. J. Paton, borough engineer.

HAZEL GROVE.—March 16th.—For the supply of broken stone, setts, kerbs and chippings, for the urban district council.—Mr. G. Severn Doncaster, surveyor.

KIDDERMINSTER.—March 16th.—For the supply of broken granite, granite screenings, broken slag, and slag screenings, for the rural district council.—Mr. G. J. Shepherd, surveyor, 85 Chester-road, Kidderminster.

WARE.—March 16th.—For the supply of tar-macadam and granite, for the urban district council.—Mr. G. H. Gisby, clerk.

STROUD.—March 16th.—For the supply of granite, basalt, limestone, and tarred macadam, for the urban district council.—Mr. E. N. Witchell, clerk.

THURNSCOE.—March 16th.—For the supply of broken granite, granite chippings, broken slag, slag screenings, flags, kerbs, channelling, and asphalt, for the urban district council.—Mr. T. Bull, surveyor.

KNARESBOROUGH.—March 16th.—For the supply of road materials, for the rural district council.—Highway Surveyor, 14 Bower-road, Harrogate.

MOUNTAIN ASH.—March 16th.—For the supply of broken limestone, gravel, native stone, and haulage, for the urban district council.—Mr. W. G. Thomas, surveyor.

BARTON.—March 16th.—For the supply of setts, kerbs, macadam, flags, and limestone chippings, for the rural district council.—Mr. A. H. Mountain, surveyor, Union Offices, Patricroft, Lancs.

FORDEN.—March 16th.—For the supply of broken and unbroken stones, for the rural district council.—The Surveyor, Forden, Montgomery.

CAERPHILLY.—March 16th.—For the supply of granite chippings, broken limestone, distilled tar, and scavenging, for the urban district council.—Mr. Alfred O. Harpur, surveyor.

REIGATE.—March 17th.—For tar-washing 130,000 yds. super. of roads, for the corporation.—Mr. A. Smith, town clerk.

CRANBROOK.—March 17th.—For the supply of road materials, for the rural district council.—Mr. S. F. Williams, acting clerk, Cranbrook.

TUTBURY.—March 17th.—For the supply of broken granite and limestone, for the rural district council.—Mr. F. Rist, surveyor, Tatenhill, Burton-on-Trent.

ELY.—March 17th.—For the supply of 3,150 tons of granite, and 1,050 tons of gravel, for the rural district council.—Mr. F. W. Firby, district surveyor, Sutton, Isle of Ely.

EASTBOURNE.—March 17th.—For the supply of Kentish ragstone, Portslade flints, compo. sand, tar, hand-picked flints, and cartage, for the rural district council.—Mr. C. M. Carter, district surveyor, Mount Sorrel, Hampden Park, Eastbourne.

NELSON.—March 17th.—For the supply of granite macadam, limestone macadam, paving chippings, pitch, cement, flags, kerb, grit setts, and creosote oil, for the corporation.—Mr. W. Shackleton, borough engineer and surveyor.

DONCASTER.—March 18th.—For the supply of dross, granite, carting, and manual labour, for the rural district council.—Mr. W. R. Crabtree, highway surveyor.

CHAILEY.—March 18th.—For the supply of flints, quartzite, Kentish rag, Mendip stone, and gravel, for the rural district council.—Mr. H. Kemp Walls, district surveyor, North Common, Chailey.

STOCKPORT.—March 18th.—For making up two streets, for the corporation.—Mr. J. Atkinson, borough surveyor.

LANCHESTER.—March 18th.—For the supply of limestone, whinstone, slag, and tarred slag, for the rural district council.—Mr. W. Cummings, highway surveyor.

GLASGOW.—March 18th.—For the supply of 40,000 tons of whin metal, for the corporation.—Mr. T. Melvin, general manager, sewage department, 72 Ingram-street.

REIGATE.—March 19th.—For private street works, for the rural district council.—Mr. A. J. Head, surveyor, 48 High-street, Reigate.

HORBURY.—March 19th.—For the supply of Tarmac, granite, whinstone, dross, flags, kerbs and setts, for the urban district council.—Mr. W. Sugars, engineer and surveyor.

HULL.—March 19th.—For the supply of macadam, for the corporation.—Mr. F. W. Bricknell, acting city engineer.

TRING.—March 20th.—For the supply of broken granite, chippings, flints, and hoggin, for the urban district council.—Mr. S. S. Gettings, surveyor.

COSFORD.—March 20th.—For the supply of granite, local pit stones, and repair of roads, for the rural district council.—Mr. W. B. Fairchild, surveyor, Lavenham, Suffolk.

STAINES.—March 20th.—For the supply of granite, tarred macadam, and granite chippings, for the urban district council.—Mr. E. J. Barrett, engineer and surveyor.

BURNLEY.—March 20th.—For the supply of local setts, flags, kerb and channel, for the corporation.—Mr. G. H. Pickles, borough engineer.

OSWESTRY.—March 20th.—For the supply of broken granite and broken and unbroken limestone, for the rural district council.—Mr. C. H. Bull, clerk.

SOUTHBOROUGH.—March 20th.—For the supply of 800 tons of basalt, granite, or other suitable stone, for the urban district council.—The Surveyor.

KIVETON PARK.—March 20th.—For the supply of broken slag, granite and tar-macadam, for the rural district council.—Mr. F. Hewitt, surveyor.

ILKESTON.—March 22nd.—For the supply of 2,000 tons of tar-macadam, 350 tons of broken granite, 1,500 tons of furnace slag, 100 tons of granite setts, and 500 yds. of kerbs, for the corporation.—Mr. Henry Jas. Kilford, borough surveyor.

CASTLEFORD.—March 22nd.—For works of street improvement, for the urban district council.—Mr. W. Green, surveyor.

COVENTRY.—March 22nd.—For the supply of broken road stone, granite kerbs, granite setts, stoneware pipes, castings, and workmen's tools, for the corporation.—City Engineer.

EARSDON.—March 22nd.—For the supply of hand-broken whinstone slag, whinstone kerb, and cartage, for the urban district council.—Mr. J. R. McMillen, surveyor, Council Offices, Shiremoor, Northumberland.

WEMBLEY.—March 23rd.—For making up two roads, for the urban district council.—Mr. C. R. W. Chapman, surveyor.

POOLE.—March 23rd.—For the supply of granite and basalt, for the corporation.—Mr. S. J. Newman, borough surveyor.

MOUNTAIN ASH.—March 23rd.—For the execution of street works, for the urban district council.—Mr. W. G. Thomas, surveyor.

FARNHAM.—March 23rd.—For cleansing and tar-painting road surfaces, for the urban district council. The Surveyor.

PERSHORE.—March 23rd.—For the supply of stone and stone hauling in the district, for the rural district council.—Mr. A. E. Baker, clerk.

CLAYTON-LE-MOORS.—March 23rd.—For the supply of road materials, for the urban district council.—Mr. V. Dodgson, surveyor.

WANSTEAD.—March 24th.—For tar-dressing the district roads, for the urban district council.—The Surveyor.

BREDBURY AND ROMILEY.—March 24th.—For the supply of road materials, for the urban district council.—The Surveyor, School Brow, Romiley.

ORMSKIRK.—March 24th.—For the supply of road materials, for the urban district council.—Mr. H. W. Chadwick, surveyor.

OXFORD.—March 24th.—For the supply of road materials, for the corporation.—Mr. W. H. White, city engineer.

WESTHOUGHTON.—March 24th.—For a steam road roller and scarifier, nominal weight of roller empty to be 10 tons, for the urban district council.—Mr. Thos. Partington, clerk.

EAST STOW.—March 24th.—For making up Victoria-road, Stowupland, for the rural district council. Mr. H. E. Wilkes, clerk, Market-place, Stowmarket

STROOD.—March 24th.—For the supply of road materials, for the rural district council.—Mr. L. Randerson, surveyor, Meopham, near Gravesend.

PETERBOROUGH.—March 25th.—For the supply of broken granite, granite kerb, and granite channelling, for the corporation.—Mr. J. W. Walshaw, city surveyor.

WILMSLOW.—March 27th.—For paving two roads with granite setts, for the urban district council.—Mr. A. S. Cartwright, surveyor.

EAST GRINSTEAD.—March 27th.—For the supply of tarred slag macadam, fine slag chippings, granite, granite chippings, Kentish ragstone, hand-picked surface flints (broken), clean brick rubble and steam rolling, for the urban district council.—Mr. W. E. Woollam, engineer and surveyor.

GATESHEAD.—March 27th.—For the supply of road materials, for the corporation.—Mr. N. P. Pattinson, borough engineer.

WATH-UPON-DEARNE.—March 29th.—For the supply of macadam, tar-macadam, kerbs, flags, and setts, for the urban district council.—Mr. J. H. Drew, [illegible] surveyor.

DROXFORD.—March [illegible] council.—Mr. J. King, surveyor, Droxford, Hants.

GATESHEAD.—March [illegible] Parliament Buildings, Edinburgh.

MIDLOTHIAN.—March [illegible] County Buildings, Edinburgh.

GLASGOW.—March [illegible]

Sanitary.

ALCESTER.—March 16th.—For scavenging certain districts, for the rural district council.—Mr. C. B. Machin, sanitary inspector.

THURROCK.—March [illegible] of about 4 miles of stoneware and iron sewers of 9-in., 12-in. and 15-in. diameter, together with manholes and other appurtenances, for the Thurrock, Grays and Tilbury Joint Sewerage Board.—Mr. G. Midgley Taylor, engineer, Caxton House, Westminster, S.W.

AYLESBURY.—March [illegible] removal of house refuse, for the rural district council. —Mr. R. T. Stewart, sanitary surveyor.

LANCHESTER.—March 16th.—For laying earthenware and cast-iron sewers, for the rural district council.—Mr. J. R. Lupton, surveyor.

SWANSEA.—March 17th.—For the construction of stoneware pipe sewers and manholes, for the corporation. [illegible]

WANDSWORTH.—March 17th.—For surface-water [illegible] High-road, S.W.

ECCLES.—March 20th.—For the construction of about 500 lin. yds. of egg-shaped sewer, 72 lin. yds. [illegible] sewer, eleven manholes, and additions and alterations [illegible] Mr. Thomas S. Picton, borough engineer.

WAKEFIELD.—March [illegible] for the corporation.—Mr. J. P. Wakeford, city surveyor.

LARKFIELD.—March [illegible] trict, for the urban district council. Mr. J. R. McMillen, surveyor, Council Offices, Shiremoor, Northumberland.

INCE.—March [illegible] sewage disposal works, for the urban district council. —Mr. A. T. Swain, engineer and surveyor.

FINCHLEY.—March 24th.—For the construction of four clinker sewage filters, for the urban district council.—Mr. C. J. Jenkin, engineer, Council Offices.

WEST LANCASHIRE.—March 24th.—For the removal of house refuse, for the rural district council.—Mr. J. Ainsworth, inspector, Banks, near Southport.

CRANBROOK.—March 29th.—For the construction of sewage disposal works, for the rural district council.—Mr. J. H. Bailey, sanitary surveyor.

Stores.

HEYWOOD.—March [illegible] earthenware pipes, bends, junctions, taper pipes, traps, gullies, setts, kerbs, flags, pitch, creosote oil, limestone chippings, granite macadam, granite chippings, [illegible] and refilling machine brush, and paraffin oil, for the corporation.—Mr. J. B. Nuttall, borough surveyor.

LEEK.—March 22nd.—For the supply of flags, kerbs, channels, setts, macadam stone, chippings, limestone and slag tar-macadam, Portland cement, sanitary pipes, pitch, oil, scavengers' bass brooms, cast-iron manhole and lamphole covers, galvanised malleable manhole step irons, cast-iron gullies and frames, [illegible] Mr. E. Beacham, engineer and surveyor.

EASTBOURNE.—March 22nd.—For the supply of Portland cement, cast-iron goods, wrought-iron goods, tools, miscellaneous ironmongery, oils, colours, glazed stoneware pipes, brooms and brushes, for the corporation. [illegible]

KENT.—March 27th.—For the supply of shovels, forks, scavenging brooms, scoops, scrapers, cart grease, tallow, oil, tools, and other materials, for the county council.—Mr. W. B. Prosser, clerk, Sessions House, Maidstone.

ROTHERHAM.—March 27th.—For the supply of broken granite, broken slag, tarred slag, tarred limestone, concrete flags, Portland cement, timber, pitch and creosote oil, grit-stone setts and kerbs, granite setts, and cast-iron pipes, for the corporation.—[illegible]

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

ROCHDALE.—Accepted for making up a street, for the corporation.—Mr. S. S. Platt, borough surveyor :—

R. Lomax, Eccles.

SHARDLOW.—For the supply of slag, tar-macadam, Leicester granite, ironstone slag, and limestone, for the rural district council.—Mr. J. S. Wooddisse, surveyor :—

Granite.—Dosthill Granite Company, Limited, Tamworth; Cliffe Hill Granite Company, Limited, Leicester; Ellis & Everard, Leicester; Mountsorrel Granite Company, Limited, Loughborough.

Tar-macadam and Slag.—Stanton Ironworks Company, Limited, Nottingham.

WANDSWORTH.—For making up Luttrell-avenue, Putney, for the borough council. Mr. P. Dodd, borough engineer :—

T. Adams, £1,130

WOODBRIDGE.—Accepted for the supply of granite or basalt broken to pass through a 2½-in. and to be rejected by a 1½-in. gauge, whole chalk flint, Washmill flint, Kentish rag, and other road material, for the rural district council.—Mr. George Cook, district surveyor :—

C. W. Parker, Bradwell-on-Sea, Essex.
E. Watkins, Ipswich.
C. R. Ayton, Wymondham, Norfolk.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

MARCH.

13.—Institution of Municipal and County Engineers: Eastern District Meeting, 92 Victoria-street, S.W. 4 p.m.

18. Concrete Institute.—Mr. Osborn Hills, F.R.I.B.A., District Surveyor for Strand, on "The London Building Acts, with Some Suggested Amendments."

18.—Mr. E. B. B. Newton, Borough Engineer of Paddington, on "The Use, Abuse, and Misuse of Roads." Municipal and County Club, 8.30 p.m.

27.—Institution of Municipal and County Engineers: South Wales District Meeting at Cardiff.

MAY.

28.—Royal Sanitary Institute: Meeting at Shrewsbury. Discussion on "The Value of Mechanical Filters in the Purification of Water."

TENDERS WANTED.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

THE URBAN DISTRICT COUNCIL OF EAST GRINSTEAD

TENDERS.

The above Council invite Tenders for the supply and delivery at Road Metal Depôts :—

500 tons Tarred Slag Macadam.
[illegible] tons Tarred Slag Chippings.
350 cubic yards 1-in. Granite.
150 cubic yards 1-in. Granite Chippings.
200 cubic yards 2-in. Kentish Ragstone.
150 cubic yards Hand-broken Sussex Flints (Broken).
100 cubic yards Clean Brick Rubble.

To be delivered carriage paid to East Grinstead or Kingscote Railway Stations (L.B. and S.C.R.).

Also for Steam Rolling for the year ending March 31st, 1916.

Forms of Tender and all other particulars may be obtained from Mr. W. E. Woollan, Engineer and Surveyor to the Council, U.D. Council Offices, East Grinstead, to whom all Tenders and Samples must be delivered on or before the 27th instant.

The lowest Tender will not necessarily be accepted.

(By order)
E. P. WHITLEY HUGHES,
Clerk to the Council.

Dated this 8th day of March, 1915. (2,449)

KENT COUNTY COUNCIL.

The Bridges and Roads Committee invite Tenders for the supply of

Shovels,
Forks,
Scavenging Brooms,
Scoops,
Scrapers,
Cart Grease,
Tallow,
Oil,

and other Tools and Materials.

Particulars and Forms of Tender may be obtained on application to the County Surveyor, St. Peter's-road, Maidstone.

Sealed Tenders, endorsed "Tenders for Tools," are to be sent to me on or before Twelve o'clock noon on Saturday, the 27th March, 1915.

The lowest or any Tender not necessarily accepted.

W. B. PROSSER,
Clerk to the County Council.

Sessions House,
Maidstone.
March 10, 1915. (2,456)

ILKESTON CORPORATION.

The General Works Committee, acting on behalf of the Ilkeston Corporation, invite Tenders for the following Materials :—

2,000 tons Tar-macadam.
350 ,, Broken Granite.
1,500 ,, Furnace Slag.
100 ,, Granite Setts.
500 yds. Kerbs.

Full particulars, Specification and Forms of Tender may be obtained upon application to the undersigned on and after Thursday, the 11th inst.

Sealed Tenders, endorsed "Tenders for Road Material," to be delivered to the Town Clerk, Sidney F. James, Esq., on or before noon, Monday, the 22nd inst.

The Committee do not bind themselves to accept the lowest or any Tender.

HENRY JAS. KILFORD,
Town Hall. Borough Surveyor.
March 8, 1915. (2,454)

COUNTY BOROUGH OF ROTHERHAM

ANNUAL CONTRACTS, 1915-1916.

The Rotherham Corporation are prepared to receive Tenders for the supply and delivery of the undermentioned Materials as may from time to time be ordered during the year ending March 31, 1916—viz. :—

1. Broken Granite.
2. Broken Slag.
3. Tarred Slag.
4. Tarred Limestone.
5. Concrete Flags.
6. Portland Cement.
7. Timber.
8. Pitch and Creosote Oil.
9. Gritstone Setts and Kerbs.
10. Granite Setts.
11. Cast-iron Pipes.

Specifications and Forms of Tender may be obtained, on application, from the Borough Engineer's Office, Town Hall, Rotherham.

Sealed Tenders, endorsed "Tender for ——," must be delivered at my office not later than Saturday, March 27, 1915.

THOS. J. [illegible]
(2,452) Town Clerk.

TRING URBAN DISTRICT COUNCIL.

TENDERS FOR MATERIALS.

The Council invites Tenders for the supply and delivery of Broken Granite, Chippings, Flints, and Hoggin as and when required for the year ending 31st March, 1916.

Full particulars and Forms of Tender may be obtained on application to the undersigned.

Sealed Tenders, endorsed "Tender for Materials," and accompanied by samples, must be delivered to me not later than noon on Saturday, the 20th March, 1915.

The lowest or any Tender will not necessarily be accepted.

S. S. GETTINGS, Assoc. M. Inst. C.E.,
Surveyor.

Surveyor's Office,
Tring.
March 9, 1915. (2,454)

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. MARCH 19, 1915. No. 1,209.

Minutes of Proceedings.

Electrolysis of Pipes.

One of the earliest methods of preventing electrolysis of underground pipes was the adoption of a coating of some non-conducting material. In order to test the value of this insulation the American Bureau of Standards carried out certain investigations some time ago and tested various coatings, including pitch, asphalt, pitch and paper wrapping, and asphalt and felt wrapping. It was then found that the average life of the paint was 113 days, the wrapping lasted longer than the paint, and the best of the wrappings lasted much beyond 300 days. It was pointed out that the failure of the coatings was due to the fact that they absorbed water, and that this in time penetrated to the iron and allowed an electric current to flow and destroy the coating by electrolysis. After the first appearance of the current flow the destruction of the coating was rapid. It is therefore to be concluded that the protection against electrolysis which is afforded by such surface insulation is only temporary, a conclusion which is also supported by general experience with coated pipes buried in the ground and subjected to the action of strong currents of electricity. Painting or otherwise coating iron with an alkali-resisting metal preservative before embedding it in concrete may serve to minimise the danger of electrolysis, but no such coating has been found that does not prevent the formation of the bond between the concrete and iron when the concrete sets. Thus all circuits within a building should be kept free from earths directly on a portion of the building itself. If the supply comes from central stations the local circuits should be periodically disconnected and tested for earths and incipient defects in the insulation. All pipe lines entering concrete buildings should, if possible, be provided with insulating joints outside the buildings. If a pipe line passes through a building and continues beyond, one or more insulating joints should be placed on both sides of the building. If the potential drop around the insulated section is 5 volts, or 10 volts, or more, the insulated portion should be shunted by means of a copper cable. The grounding of electric currents to water pipes and ground plates is in general not to be recommended in the case of concrete structures. The United States Bureau of Standards has found insulating joints of great value in reducing the current in pipe lines, and so reducing the corrosion caused by such current. These insulating joints should not be relied upon as the sole means of protection, but they are an important auxiliary means of protection. It cannot be said, however, that the problem has yet been solved. The co-operation of water and gas engineers with the engineers of electrical companies is therefore to be desired, in order that everything may be done to find the subject with an open mind and to mitigate the nuisance as far as may be possible.

* * *

Seaside Improvements.

In another column will be found a special article on "Seaside Improvements," from the pen of a contributor who speaks with knowledge on this important subject. The modern seaside resort must be run on business lines if it is to succeed; and local authorities are coming to recognise more and more that the expenditure of large sums of money in suitable directions may be more than justified in the return, both direct and indirect, produced. The keenness of the competition for patronage between the various resorts is evidenced by the increase in the practice of advertising attractions in various ways. The mere issue of advertisements, however, will never produce the desired result, unless they are reinforced by the personal satisfaction and recommendation of the visitors themselves. The hand of the municipal engineer is seen in almost every form of attraction. Parks and open spaces, golf courses, bathing pavilions, open-air baths, piers, and marine lakes alike come within his province; while the housing of the band or orchestra upon which, by the way, Bournemouth spends no less than £10,000 a year, as we see by our contributor, calls particular attention to the changes which are taking place in regard to the provision of bathing facilities. The day of the bathing machine is past, and few, save the antiquarian, will be found to regret it. Not only so, but there is also a growing tendency to substitute the artificial open-air bathing pool for the dip in the open sea. Many works of this kind have been projected and are now under construction. Another modern attraction in places where large tracts of sandy foreshore are left uncovered except at high tide, is the provision of a marine lake where safe boating may be enjoyed at all times. The most notable work of this kind is to be found at Southport, where the lake has an area of 45 acres, and, besides allowing boating and yachting, has a portion fenced off for a water chute and children's paddling pool. In spite of these new forms of attraction, however, piers and pavilions fully retain their popularity, and many towns are contemplating new works or improvements in this direction. In particular, we may mention the competition in which the Brighton Corporation offer substantial premiums for designs for rebuilding the famous Aquarium. One effect of the war, no doubt, will be to increase the popularity of our home holiday resorts, and the more far-seeing authorities are already spreading their nets to catch their share of the new patrons.

An Attractive Appointment.

The St. Germans Rural District Council, being desirous of securing the services of a whole-time officer as their surveyor, have exercised their ingenuity in drawing up the following list of conditions for the appointment:

ST. GERMANS RURAL DISTRICT COUNCIL.

SURVEYOR.

The surveyor shall be a whole-time officer, and shall do no other work outside the council.

He must carry out his duties personally, and not by an assistant.

He must reside within the St. Germans district area, in a place approved by the council.

He shall not be a shareholder or have any interest in any quarries, contractors, tradesmen, or others doing business with the council.

The surveyor must provide his own horse, cycle, or other means of travelling at his own expense. Also his own office.

He will be required to keep all the usual books and accounts to the satisfaction of the district auditor, before whom he must bring them at the usual half-yearly audits.

He must attend the monthly meetings and committee meetings of the council, report things to them, and also bring the parish wages books to the meeting.

He must place before the Finance Committee, monthly, all bills and accounts initialled by him, which he shall have satisfied himself are correct; also his estimates for the ensuing month.

He must prepare plans and specifications for any contracts required, and see that the contracts, in all cases, are properly carried out.

All quarries are to be worked in a satisfactory manner, and the *surveyor* is to measure all stones, and see that they are of the quality required.

Notice to be given to by the surveyor to the councillors of the parish when stones are measured.

The usual notices under the Quarries Act to be kept posted in all quarries worked by the council.

The surveyor to visit all roads as often as possible, and see that the roads are in order, drains and water tables clean, hedges trimmed, and bridges in good repair.

The surveyor, as far as possible, to look after all the men who are employed by the council, and see that they work their proper number of hours and do their work in a satisfactory manner; in any case where the surveyor finds a man is not doing so he may put him to do piece or contract work at the usual prices paid by the council.

All men to be paid once every fortnight, and arrangements to be made to pay the men without their wasting time in going to the office.

The surveyor must prevent any person from breaking up the roads for any purpose without them having first received his permission to do so.

The surveyor is to furnish the bond of a guarantee society or company for £200.

Salary £120 a year, payable monthly. Surveyor to give or receive three months' notice to terminate the office.

No personal canvassing will be allowed. Candidates chosen to appear before the council will be allowed third class railway fare.

We will refrain from any merely literary criticism of this document, and content ourselves with calling attention to some of the more startling requirements of this attractive appointment. In the first place it will be noted, the new surveyor is to be a whole-time officer, although the salary is only £120 per annum, and in spite of the fact that his predecessor, with a salary half as large again, was permitted to engage in private practice. The next stipulation—that he must carry out his duties personally, and not by an assistant—means not only that the surveyor will have no holidays, but it also renders the adequate supervision of upwards of 250 miles of roads (which the district contains) a sheer impossibility. It will also be observed that out of his modest pittance the surveyor has to provide his own office and his own "horse, cycle, or other means of travelling." As a matter of fact experience has shown that a cycle, horse and trap and even a motor cycle are inadequate, and a small car has been found necessary, leaving, it will be conceded, very little margin out of the salary offered. In addition to attending council and committee meetings, the surveyor has thrown upon him the rather vague duty of reporting "things" to them. He has to measure all stones, but before doing so he must "give notice to the councillors of the parish." We have examined the conditions attaching to many appointments of this kind, but we do not remember ever having seen this one before; and we can hardly imagine that any self-respecting surveyor will be found to tolerate such an arrangement. Another condition which gives some idea of the consideration with which the surveyor may expect to be treated is the one which says that arrangements must be made to pay the men without their wasting time in going to the office. Nothing is said about wasting the time of the surveyor, presumably because the whole of that commodity is to be at the disposal of the council. We understand that in due course three candidates were selected for interview. One was an ex-pupil of the former surveyor, another was a village carpenter, while the third was a gentleman known in his own locality as the "tramp surveyor." The last-mentioned did not attend, and the appointment was postponed pending his appearance. It may be that he, at any rate, can supervise 250 miles of roads without either horse, cycle, or any means of travelling other than shanks' pony!

Willington Urban Council and the House Owners.

Back-to-back houses have very few defenders, but it is doubtful whether, in the abstract, they may not possess some meritorious aspects if they become the subject of such courtesies and expressions of goodwill from landlords towards the municipal authorities as were reported recently at the meeting of the Willington Urban District Council. The surveyor, Mr. J. H. Gardner, stated that representatives of the owners of back to back houses attended a Works Committee meeting, at which it was recommended that the council should give an assurance to the county council that all such property within the council's area would be converted into through houses, or otherwise so altered and improved that proper through ventilation was provided to put them in a sanitary condition within the next five years. The result of the meeting appears to have been quite satisfactory, for the council received subsequently a communication in which the owners undertook cheerfully to carry out the council's requirements within the term stipulated, and expressed the hope "that the plans submitted would receive the usual courtesy and fair-minded consideration for which the Willington Urban District Council is so justly noted." That this praiseworthy expectation did not remain unfulfilled is proved by the receipt of a final communication from the landlords tendering to the council and Dr. Hill, county medical officer of health, their sincere thanks "for the splendid fairness and courtesy with which our deputation was received and treated."

This is a well-directed quite a new spirit in which to meet the municipal authority, and that it has been evoked by back-to-back houses argues hopefully for its eventual extension to, say, schemes of sewerage, sewage disposal, and private street works. Municipal bodies in regard to these matters have hitherto been smitten not only upon one, but both cheeks. The Willington Urban District Council, despite its past reputation for fair-mindedness, will doubtless treasure as a cherished possession a testimonial which falls to the lot of few authorities whose duty it is to administer the laws of public health.

Organisation of Labour. The Committee of Imperial Defence have been considering the question of mobilising the labour forces of the country with a view to meeting the enormous demand for labour, not only for the manufacture of the munitions of war but also for the production and transport of the food supplies for the civil population. One of the sources to which they are looking for the necessary additional workers for these purposes is the labour employed by the municipalities and other local authorities. To this end two circulars have recently been issued one by the Local Government Board and one by the Road Board. The request of the former authority is that as far as possible male labour of high physical quality should be released for national purposes, and that men of more advanced years or where practicable, women workers should be substituted. The circular appears to be of quite a general character, so that, although the local authorities may be anxious to do all they can in the matter, difficulties will undoubtedly arise unless some machinery is set up for securing the transfer of the released labour to the desired places. The Road Board circular has been sent to the county surveyors of England, to certain county surveyors of Wales, and to most of the county and metropolitan boroughs, and is of a more specific character. The board state that they are engaged in arranging with various highway authorities for road work required in connection with military traffic, and that, owing to shortage of labour, progress is slower than it ought to be. They then ask for the temporary service of good workmen, who would receive, in addition to their pay, lutting accommodation, with blankets and rugs. Further, railway fares would be paid to the scene of operations and also return fares to those who return to their present employment. We feel that it is unnecessary for us to urge local authorities to respond to these appeals, feeling sure that their patriotic spirit will lead them to do so, even at the cost of considerable local inconvenience.

War Bonuses. Many local authorities have found themselves compelled to take into consideration the question of granting to certain of their employees of the lower grades some temporary increase of pay so as to help them to meet the increase in the cost of living which has taken place since the outbreak of war. The line has in many cases been drawn at those officers and servants who are in receipt of a wage of less than thirty shillings a week. The matter was before the London County Council at their last meeting, when a comprehensive report was presented by the General Purposes Committee, who recommended that certain increases should be granted in the first place for a limited period of three months. They further recommended that no discrimination should be made against those officers and servants who are on active service. The latter recommendation appears to us to be eminently reasonable, although we understand that some local authorities have not extended the grant to such cases. Moreover it has been contended that additional pay should only be given to those employees who are married, or have dependents. In our view this course is illogical, unless similar distinctions are to be made in fixing rates of wages at ordinary times. The question is, What is a fair price for labour in the prevailing circumstances. It appears to us to savour of the inquisitorial if local authorities, in fixing rates of wages, are to inquire how they are to be spent, or what are the domestic responsibilities of the recipients. Another discrimination which ought not to be made is that between junior officials and workmen. The former, with appearances to keep up, are at least as hardly hit as the latter by the general rise in prices.

Heavy Motors and Roads. In our issue of last week we were able to announce that in view of the complaints which have been made as to the alleged excessive damage caused to roads by certain classes of heavy motors and locomotives, Mr. Herbert Samuel, the President of the Local Government Board, has appointed a small expert committee to inquire into the sufficiency of the existing requirements with respect to the construction of these vehicles, including weights on wheels, widths of tyres, diameters of wheels, and so forth. The terms of reference are very wide, the committee being asked "to consider the law and regulations relating to the construction and use of road locomotives and heavy motor cars in Great Britain, and to report what amendments, if any, are desirable." The committee is a strong one, and its personnel is such as to command complete confidence, municipal engineers being well represented in the persons of Mr. E. J. Lovegrove, the borough surveyor of Hornsey, and Mr. J. Willmot, the county surveyor of Warwickshire; while Mr. P. M. Crosthwaite, one of the engineering inspectors of the Local Government Board, also has a place. Among the questions raised by the use of roads by heavy motor traffic is that of contributions by the owners of motor omnibuses towards the cost of road maintenance. It is understood that a joint Select Committee is to be appointed for the purpose of dealing with this particular aspect of the case.

District Meetings. Last week we gave publicity to the arrangements made in connection with the South Wales District meeting of the Institution of Municipal and County Engineers which is to be held on Saturday, the 27th inst., at Cardiff, and in the present issue we reproduce the programme of a South-Western District meeting which will take place on the same afternoon at Taunton. Not for the first time does it happen that two of these gatherings are fixed for the same day, and we cannot help thinking that the arrangement is, to say the least, a somewhat undesirable one from the point of view of members generally. Where the meetings happen to be in widely separated districts there can be little or no objection to the clashing of dates, but when, as in the present instance, they are held in localities which are fairly accessible to numerous members of other districts, there can be no doubt that the attendance at one or both of the gatherings must be affected in some degree. The point is one that seems to deserve the attention of district secretaries.

Pay with the Colours. We are quite in accord with Mr. Montagu, Parliamentary Secretary to the Treasury, in the plea he made recently in the House of Commons that civil servants with the Colours should not receive less than the total sum they were entitled to receive in civil work, to ensure this a proportion of their ordinary salaries being allowed when necessary to supplement their Army pay. Local government officials are to all intents and purposes civil servants, and we have frequently urged that this principle should be applied to them. If it had, it is conceivable that Notts County would not have lost an engineering official whose reputation as a road-engineering expert extended beyond the boundaries of this country. It is surely time that local authorities adopted, as an absolute minimum, the policy enunciated by Mr. Montagu.

Seaside Improvements.

THE ACTIVITIES OF MUNICIPAL AUTHORITIES.

Specially Contributed to The Surveyor.

The increasing prosperity of all classes, coupled with the improved travelling facilities by rail and road, makes it necessary for those seaside authorities who wish to attract the holiday public to bestir themselves and put their house in order to receive their paying guests. The struggle for existence is very keen, and it is a case of the survival of the fittest with communities equally as with the individual. Many local authorities do not make the most of their natural advantages, or, where these are lacking, realise the need for assisting Nature by providing other attractions. In many cases it is owing to undue modesty; in others it is due to a policy of masterly inactivity which aims at keeping low rates, though not the stagnation which inevitably follows. On the other hand, we find many towns with few natural advantages who, by judicious enterprise and expert window dressing, go ahead by leaps and bounds. The bold advertiser who has studied the weaknesses of his fellows considers modesty a blunder—if not worse—and therefore trumpets as loudly as possible the praises of his town, with the certain knowledge that a large part of the world will take him at his own valuation. The advertising agent and director of entertainments in our seaside resorts are powers in the land, and with the large funds now placed at their disposal by their councils they are likely to become even more powerful. Still, they must be backed by something more tangible than advertising, and it is to the work of the municipal engineer or architect that many towns owe so much of their popularity. Apart from a good water supply and good sanitation and lighting, the provision of piers, promenades, parks, gardens, lawns, tennis courts, concert halls, bandstands, bathing pools and pavilions, marine lakes, shelters, and similar attractions all fall to the lot of the engineer or architect to design. On the style on which these works are designed, and the manner in which they are constructed, a town's attractiveness greatly depends. The spending of large sums does not necessarily ensure satisfactory results from an artistic point of view. Ostentation and vulgarity are frequently found in the plutocrat, and the character of our governing bodies can often be judged by their municipal works. The engineer of the large town must necessarily be a good organiser, but he is not so necessarily a man of good taste. The engineer in the small town is frequently no better in either direction; but still, we often find in some little-known town or district municipal work carried out not only with great technical ability, but with the most praiseworthy regard for its artistic possibilities.

The sociological side of seaside development cannot be ignored by any municipal authority in its efforts to cater for the public. We find the things which succeed in one place are an utter failure in another. While some towns lay themselves out to cater for the tripper, others taboo him to the extent of memorialising the railway companies to stop all day trips. Again, caste rules so largely in some places that the outsider who presumes to pitch his tent in their midst is treated as an interloper and sent to Coventry, and he may be lucky if he think he has got into a community of anchorites. A few miles away another town so fully recognises the gregarious disposition of its visitors that it welcomes all and sundry without standing on the ceremony of an introduction.

Towns so very similar as Blackpool and Douglas differ entirely in their estimate as to the value of piers, for while Blackpool has three, Douglas does not, apparently, feel the need of one. Brighton finds two none too many, but Ostend can hardly be said to have one, for the Estacade, while providing a promenade some 600 yds. to sea, is simply a primitive wooden structure affording nothing in the way of the entertainments found on nearly all English piers.

Again, while towns like Bournemouth and Southport spend immense sums on the maintenance of town bands—Bournemouth spends £10,000 a year—and make large profits out of doing so, Blackpool provides no public band, though very fine orchestral bands are to be found on the piers and in the entertainment palaces. There are, moreover, a large number of places where bandstands have been erected at a large cost, which utterly fail to attract anything like adequate support.

Most places find a park or gardens a great attraction, and one would think that those towns which did not provide them could not expect such popularity as those places which have, at very great expense, laid out beautiful parks and gardens. Yet we find two very keen rivals on opposite sides of the Ribble Estuary, one with fine parks and the other with none, and the town without a park undoubtedly attracts a far larger number of visitors.

Golf, again, appeals to a very large class of holiday makers in the present day, and places like Cromer, Sandwich, Lytham, St. Annes and Hoylake all owe much of their popularity to their excellent golf courses.

Open-air bathing is almost universally popular, but the facilities for indulging in this healthy recreation are very varied in different parts of the country. The old bathing machine—the box on wheels—is, along with the hideous bathing dress imposed by Mrs. Grundy on our grandmothers, doomed to soon disappear. If the Germans in their raids on Scarborough and Yarmouth should capture these specimens of "frightfulness," we should not begrudge them their booty, and there really appears to be very good grounds for thinking they would make a strong appeal to their "kultur" and "interest" in "art" tastes.

BATHING PAVILIONS AND OPEN-AIR SWIMMING BATHS.

The more modern dressing pavilion, with hot and cold water spray or foot baths, promises to supplant other forms of dressing-boxes. The large bathing pavilions at Margate, at Palm Bay, and more especially at Westbrook, are great improvements in every way. The new dressing pavilion at Westbrook is a substantially built concrete structure, which was erected last year at a cost of £6,000. It provides dressing accommodation for sixty persons of each sex, and contains a large cafe, which brings in a very substantial rent. Even the canvas bathing tent promises to be superseded in many districts, as in wet or rough weather it is by no means an ideal shelter or provides the privacy that could be desired.

Probably in no direction is so great a change likely to take place as in the provision of bathing facilities. A few years ago only a few open-air bathing pools were to be found at our seaside resorts, and those, such as Margate, Morecambe, and Scarborough, were of primitive description. During the past year or two a large number of up-to-date bathing pools have either been constructed or projected, and a few remarks with regard to these pools will be of interest to many municipal engineers.

Southport last year constructed an open-air bathing pool, which is probably the largest in the Kingdom. It is 400 ft. long, 200 ft. broad, and varies in depth from 18 in. at the sides to 6 ft. 6 in. in the middle. Although the pool is filled at high water, and, like most other holiday places, it was badly hit by the war, it has been a great success, and 1,000 persons have paid for admission to the bathing enclosure in a single day. Over 2,000 visitors, and a total of 20,000 in a month.

At Scarborough, despite the bombardment by the Huns, a very fine open-air bath, with dressing pavilions, bungalows, and café, is being constructed at the South Bay at a cost of £13,200. The bathing pool is oval in shape on the sea side, with a flat side to the cliff, and its length is 350 ft. by 190 ft., with an average depth of 2 ft. 7 in. The bathing pavilion is on the cliff, and contains seventy-six dressing-boxes, [illegible] modation at each end for schools. Above the boxes a large café is to be constructed, and behind, in terraces, a block of nineteen bungalows is to be erected, and a laundry block will be provided. The council are so convinced of the attractiveness of this form of bathing that they have recently decided to construct a somewhat similar bathing pool at the North Bay at a cost of £10,000.

Smaller open-air bathing pools have also been constructed at Hoylake and Southend. The Hoylake bathing pool is 129 ft. long by 100 ft. broad, and has

a depth of 3 ft. at the deep side and 6 ft. at the other. A smaller pool for children 100 ft. by 40 ft. is also to be constructed this year. There are to be dressing rooms for ladies and gentlemen, and refreshment rooms and tea-houses have been provided. The bathing pool is popular that the dressing and bathing accommodation will have to be greatly increased, and is likely to be extended in the near future.

At Southend a new open-air bath, 400 ft. long by 200 ft. wide, is to be constructed and opened at a cost of £5,000 and has been fixed by Mr. Lidell, the borough engineer, at the joint head levels of the Institution of Municipal and County Engineers, which is published in THE SURVEYOR of June 12, 1914. The depth of water will vary from 2 ft. 6 in. to 8 ft., with a diving pool 8 ft. 6 in. deep. Dressing and bathing accommodation for [illegible] bath, & c., is to be provided.

At Lytham the council have approved plans for a bathing pool, 350 ft. long by 120 ft. wide, with depths varying from 15 in. to 6 ft. 6 in., with a diving pool at one end 7 ft. deep. Dressing [illegible] each for ladies and gentlemen are provided, with ten larger boxes for parties and schools. The scheme also provides for twenty bungalows, ladies' and gentlemen's swimming club rooms and cafe, and, together with the promenade work, to [illegible] £10,000.

At St. Annes an open-air bath [illegible] constructed at a cost of £5,000. The bath [illegible] long, 120 ft. wide, and vary in depth from 7 ft. to nothing. A cafe, fifty-four dressing-boxes with roof promenade and [illegible] are to be provided.

The Blackpool Corporation propose to construct an open-air bathing pool on the foreshore of the same size as that at Southport—400 ft. long by 200 ft. wide.

At Fleetwood the urban council have [illegible] enclose 16 acres of the foreshore, which they are to develop by constructing an open-air bath, 330 ft. long by 200 ft. wide, with depths varying from 6 in. to 7 ft., with tennis courts, bowling greens, and recreation ground at an estimated cost of £20,000.

There are several interesting engineering problems in connection with these open-air bathing pools which call for the designer's careful consideration. The most obvious is the one dealing with the level of the pool, for, while we find at Southport, Southend and Lytham that the pools will be filled at high water by the tide, at Hoylake and St. Annes it is proposed to pump the water into the pool. Nearly all will empty the bath by gravitation, but a small quantity at Southend is to be pumped to sea. Again, it is not considered necessary to filter the water at Southport or Hoylake, though, with the very sandy foreshore at both these places, much sand is sure to be carried into the bath, and the water cannot be so clean as at Southend. Lytham and St. Annes, we [illegible] to be adopted. At Southport and Lytham the floor of the bath is only concreted for a few yards from the sides of the bath, as the sand is sufficiently close to retain the water; but at Southend and Hoylake the bottom of the bath is concreted.

MARINE LAKES.

Among other outdoor attractions which several municipal authorities have provided, or are about to provide, are marine lakes. Where there are large expanses of foreshore which are only covered at high water, the need of a lake for safe boating at all states of the tide is very urgent.

At Southport, as is well known, the sea has receded so far from the promenade that a tramway is laid to the end of the pier to enable visitors to get a glimpse of the sea. The corporation have, however, not only refused to accept quietly these unkindly rebuffs of Nature, but by their enterprise and the skill of their engineers they have transformed this sandy waste into beautifully laid-out gardens and lawns, and constructed a large lake which does much to console visitors for the absence of the sea. The lake has an area of 15 acres, and besides allowing boating and yachting, has a portion fenced off for a water chute and children's paddling pool. The approximate number of persons using the lake last year was 373,000, and a revenue of £4,646 was obtained.

The marine lake at West Kirby is 33 acres, nearly ½ mile long, and is largely used by boats and yachts. About £500 is taken, half of which is paid by the boat contractor to the council for the use of the lake.

A marine lake is to be constructed at Lytham, and it is intended to enclose about 25 acres of the foreshore for this and the open-air bathing pool. The [illegible] Lytham to [illegible] £2,500.

Other places [illegible] marine lakes are to be found are Cleethorpes and Rhyl, and one is also proposed at St. Annes-on-the-Sea.

[illegible]

[illegible] the provision of pier pavilions that most enterprise is shown by local authorities, for a large number of piers or concert halls on the sea front are owned by municipal authorities. Among the municipalities that have recently [illegible] the corporation have decided to erect a band and concert pavilion at a cost of £20,000. The Bournemouth Town Council have recently received the sanction of the Local Government Board to provide a pavilion [illegible] at a cost of £60,000.

Brighton Corporation have decided to offer 175 guineas for a competition for the rebuilding of the Aquarium, with a concert hall to hold 1,200 persons, [illegible] and garden terraces, at a cost of £22,000. This well-known building has had a rather chequered career, and it is to be hoped that the new building will be more successful than the existing building, and more worthy of the fine site on which it will stand. Private enterprise is also going to effect a great improvement in our leading watering-place. A covered bandstand and concert hall are to be erected on the West Pier, and the Palace Pier is to be widened from 60 ft. to [illegible] and [illegible] to accommodate 4,000 persons, and an outdoor restaurant are to be erected on the widened pier. The estimated cost of the improvements on the two piers is about £40,000.

At Southend the main deck and upper deck of the pier is to be increased by 1,800 sq. yds. On the upper deck there is to be constructed a large café, the roof of which will form a promenade at a higher level. These proposed works, which are to cost £20,000, are [illegible] THE SURVEYOR of June 12, 1914.

Yarmouth is to spend £24,640 on a swimming bath, lawn, and sea-shore improvements, and marine parade extensions. Burnham Urban District Council is to spend £10,000 on a new pier. Skegness are going to build a garden pavilion on the foreshore with a frontage of 107 ft., a café on the ground floor 41 ft. by 18 ft., and a roof-garden café 80 ft. by 30 ft.

At Aberystwyth a new pier, with a pavilion at the land end and a landing-stage at the other end, is to cost £25,000.

Lytham Urban District Council are proposing to convert their Assembly Rooms into an up-to-date large concert hall, the scheme also including the provision of new indoor baths and new council offices. St. Annes are proposing to erect a concert pavilion in the newly acquired site for gardens which Lord Ashton so generously provided for them.

This list is by no means exhaustive either of the number of towns or the class of work in which municipal and private enterprise has been active in seaside resorts during the past year. It is, however, sufficiently complete to show that we are not likely to be left behind in the competition with Continental nations for the patronage of the holiday seeker. So far as sanitation goes we have long held the foremost place, but it is only recently that we have awakened to the great attraction of outdoor life and amusements. Our uncertain climate has had a great deal to answer for this, but the very general adoption of open-air cafés in our seaside towns, not to mention those in our inland health resorts and the parks in our large towns, shows that we are now overcoming any objections or difficulties experienced in this direction. Indoor entertainment is also necessary, and one of the most striking features of our public life is the eagerness with which our municipal authorities now either supplement or supply the recreations which private enterprise neglects to provide. The war on the Continent is bound to keep many of our people at home for some time, and those who stay here can certainly look forward to being entertained in the very best and most attractive manner.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

The Treatment of Waste Waters from Tin and Lead Mines, Gut Factories, and Piggeries.—(VII.)

By G. BERTRAM KERSHAW, M.AM.SOC.C.E., M.INST.C.E., Late Engineer to the Royal Commission on Sewage Disposal.

Tin mining is now almost confined to the county of Cornwall, while lead is now chiefly worked in Wales, Cumberland, and the mountain limestone district of Derbyshire.

Taking tin mining first. The tin is obtained from cassiterite or tinstone, the mineral being got by sinking shafts and mining operations. It is worthy of note that the tin lodes in Cornwall run east and west, tin being usually met with in close proximity to, or mixed with, copper ore, together with arsenical pyrites, bismuth, mundic, and so forth. To get the tin the ore is passed through stamps and crushed, the pulverised material being carried by a stream of water over specially constructed tables, in order to separate the heavy tin from the other matter. The water which carries off the dirty waste material, and also a certain proportion of tin, is termed "tailing water," and is usually discharged into the most convenient river or stream; but occasionally the water is re-used.

These tailing waters contain very large quantities of suspended matter sometimes as much as 2,000 parts per 100,000; the solids in solution, however, are usually small. The bulk of the suspended matter settles fairly readily, but it must be remembered that a very large quantity of solid material has to be dealt with in the aggregate, even in the case of a small mine.

The Rivers Pollution Commission of 1868, dealing with the question of tailing waters from tin mines (Fifth Report), say: "Among the numerous samples there is not one which even approaches the transgression of any of our proposed standards relating to dissolved matters; indeed, in most cases, mere subsidence leaves the supernatant water much purer than the average potable water supplied to towns, the only objectionable constituent in solution being arsenic, which is present, however, in but very small proportion. On the other hand, these waters grievously pollute and silt up the rivers into which they flow by the suspended matter contained in them. Each 1,000,000 gallons of water issuing from the Dolcoath mine, for instance, carries with it more than 80 tons of suspended rubbish, 200 lb. of which are metallic arsenic—equivalent to 264 lb. of white arsenic. Nearly the whole of this suspended matter is easily deposited when the water is quiescent. None of the samples contained copper in solution, or exhibited any marked acidity."

The "Red" river, in Cornwall—so called from the colour of its water and bed—may be mentioned as a river which has received tailing waters from numerous tin mines for generations, and in this particular case, together with many other similar small rivers and streams of the same type, it would appear difficult to say to whose advantage it would be that the waste mine waters should undergo treatment before discharge. Certainly in the case of the tin-mining industry it might possibly be profitable to settle out the [illegible] to waste in the tailing waters; or, if not actually profitable, the tin recovered might cover the cost of settlement. Selective settlement, or the adjustment of velocities through the tanks so as to deposit materials of different specific gravity in separate compartments, would no doubt be well worth attention.

LEAD MINING.

Lead [illegible] as formerly, but there are still mines which are profitably worked in different parts of the country; for example, the Weardale mines and the Threlkeld mine near Keswick. Lead ore is termed galena, and it is often associated with silver, zinc, copper, &c.

The process to which the ore is subjected in order to recover the lead from the worthless rock is, to all intents and purposes, similar to that employed in tin mining.

The tailing waters resemble somewhat closely those derived from tin mines, and they contain large quantities of [illegible] suspended matter, further they are [illegible] lead and arsenic, but the [illegible] appear to have been very fully investigated so far, and the main apparent damage caused by lead mines appears to be the injury caused by the silt being washed from the river bed on to adjoining pasture land during floods.

With reference to the question of damage to cattle, the 1868 Commission observed: "We are bound to add that, excepting the destruction of ducks and other poultry reported to us at mines near Hexham, on the north side of the river Tyne, where large quantities of carbonate of baryta are obtained (to the deposit of which in the roadways and river channels, no doubt, this fatality is due), no complaints from stock-owners in the neighbourhood of lead mines in the North of England have been made to us. The valleys are wider, and there is ample space for storage of waste materials around these mines in Allendale, Teesdale and Weardale, and the moorland which may be occasionally overflowed by the muddy waters is of little value."

Settlement of tailing waters has been found to be practicable at several lead mines, and good results have been obtained, the settled waters containing very little suspended matter, and, where there is sufficient area available, lying at a suitable level, which can be embanked to form settling ponds, such a method of treatment can be economically carried out. Where, however, settling tanks or ponds had to be constructed of building materials, the cost would be very heavy by reason of the large volume of tailing water produced—often considerably in excess of 200,000 gallons per twenty-four hours.

A source of trouble which not infrequently occurs where minerals are got is the ochre water which is often met with, particularly in the case of old disused mines or pits.

Such waters were expressly exempted by the Rivers Pollution Act of 1876, since they came under the heading of mine water "in the same condition as that in which it has been drained or raised from such mine."

In many parts of the country—particularly in Durham the beds of the streams are covered with ochreous matter, while fish life and water weeds alike are absent.

A natural remedy would be the treatment with lime of the acid iron water before its discharge, but this would be extremely costly, and who would be responsible for the cost of treatment in the case of disused mines, where the water has risen up in the workings, and [illegible] the salts?

GUT FACTORIES.

The [illegible] on the preparation [illegible] for sausage skins, gut bands and strings. The bulk of the work is done in the winter months.

The [illegible] guts are soaked for periods of about twelve hours each in galvanised-iron tanks, in two changes of clean water; they are next laid upon boards, and carefully scraped with thin wooden scrapers, all adherent mucous and slime being removed. They are next inflated to detect any small holes or tears, and, if required for [illegible] they are packed [illegible] with salt and dispatched to market.

When gut bands [illegible] are wound, under tension, round rectangular wooden frames and dried. The chief use of this form of gut is for violin strings and for stringing tennis rackets, the butt ends of the guts of Welsh sheep being preferred for the latter purpose. At a fair-sized gut works as many as 2,500 sets may be dressed in a week at a busy season. The waste liquid, which is not large in volume, consists of the contents of the soak tanks when run off, together with the washings from the floors, utensils, &c. It resembles a brownish water, and has a most nauseating, pervading smell. The solid matter scraped from the guts is generally used [illegible] feeding pigs.

At one particular [illegible] are [illegible] holding 450 gallons, and two smaller ones [illegible] 225 gallons, or a total combined capacity of 900

gallon. As these are filled twice in the twenty-four hours, the total volume of waste liquor may be taken to be about 2,000 gallons, inclusive of floor washings. The waste liquors flow into a covered tank filled with clinker. This tank is emptied once a year by means of a chain pump.

The liquid from this tank or filter flows by pipes some little distance to a pit in a grass field, filled in with stones, and here all the liquid is absorbed. About an acre of grass land is available, if required. Pigs are kept on the land, and all scraps from the works are conveyed here and spread over the land for the pigs to eat.

The tank was obviously doing no work on the liquid, and such [illegible] was used [illegible] could not have been expected to have done any. The liquor [illegible] and to have obtained anything like a satisfactory effluent, a very low rate of treatment per cube yard of filtering material would have been [illegible] lieu of dilution before filtration.

By the exercise of [illegible] and underdraining [illegible] reach the drains and mingle with the bulk of the waste liquids, much can be done in reducing the ultimate strength of the liquid to be purified, and there is no difficulty in country districts in disposing of the solid matter by feeding pigs.

Piggeries.

Much difficulty [illegible] waste liquor from piggeries, where large numbers of pigs are kept, since the liquor is [illegible] ten to fifteen times as strong as [illegible] of average sewage.

There are perhaps not many piggeries in this country where [illegible] pigs are kept, as in Ireland, pigsties [illegible] are fairly frequently met with. Moreover, the treatment adopted for the purification of piggery sewage will also answer for the treatment of ordinary farmyard liquid wastes, where [illegible].

As a general rule, piggeries are worked in conjunction with creameries or cheese factories, the by-products being utilised for feeding the pigs.

The sewage from [illegible] urine, with water used for washing down [illegible] In no circumstances should the faeces be permitted to mix with the rest of the sewage; they should be collected and disposed of for manure. This solid manure should be [illegible] sawdust placed on a concrete floor, the whole floor being [illegible] A gutter should surround the floor, leading to a drain, protected by a grid. There is no difficulty in getting rid of the solid manure [illegible] it will [illegible] a valuable manure [illegible].

A certain amount of [illegible] to the drain after the cleaning down of the [illegible] especially during rainfall, but if the solids are regularly removed it will be reduced to a minimum.

About three gallons of [illegible] produced per pig per day, most of it during the day-time, but a rather large amount of water is used for washing down the floors which must be kept scrupulously clean; so that the total dry-weather volume of liquid sewage per pig may amount to 4 to 5 gallons daily, and during rainy days there will be a considerable addition to this quantity.

The degree of purification required will, of course, depend very largely upon the local conditions, and in the majority of cases it is quite possible that a high-class effluent will not be needed. In certain particular cases, however, as, for example, where the effluent enters a small sluggish stream, full treatment will be advisable, if not essential.

Preliminary treatment of such a strong* liquid is best carried out by precipitation with lime in settling tanks, constructed in duplicate, each of them having a capacity equivalent to about 1½ days' flow of sewage.

The tank liquor is best treated on deep percolating filters of medium-sized material, and the filter effluent should be passed through shallow sand-straining filters.

Unless a very low rate of treatment is adopted—say 20 to 25 gallons per cube yard per twenty-four hours—a good effluent cannot, as a rule, be uniformly obtained, and in general it is much better, wherever practicable, to dilute the tank liquor with from two to three times its volume of clean water, and then to filter at a rate of about 75 gallons per cube yard per [illegible]. If [illegible] very much better distribution will be obtained.

It must be remembered that the filter in dry weather will probably only be working for some sixteen to eighteen hours out of the twenty-four, and in order to spread the work given to the filter over [illegible] settling tanks, the tank liquor being drawn off [illegible] chamber and syphon can be used, and intermittent distribution; but this method does not give as good results as the direct feed from floating draw-off arms.

The writer somewhat recently gave evidence in a lawsuit originating in the pollution of a loch by sewage from a piggery, and later on he was called in to advise in the matter. The existing plant consisted of a septic tank, followed by double-contact beds fed by a dosing chamber, the second contact effluent being distributed over a small area of underdrained land before entering the loch. The existing plant was good of its kind, and would have turned out a good effluent from an ordinary domestic sewage of average strength, but the contact beds were not anything like capable of oxidising the very strong liquid with which it had to deal, although this was diluted with something like twice its own volume of loch water. Later, the original contact medium (broken bricks) was replaced by hard clinker, but the effluent, although perceptibly improved, was still a strongly polluting liquor. It was necessary, in this particular case in question, to obtain a very good effluent, and the writer advised a deep percolating filter to treat the second contact bed liquor, the filtering material being hard, medium-sized clinker, a shallow mechanical sand filter following, to remove suspended solids. The filtering material while being placed in position in the filter was kept moistened with a solution of sewage and garden soil, since it was of the utmost importance that the filter should yield good results within a very short interval of time. As the filling of the filter neared completion, a transition was gradually effected from domestic to piggery sewage.

The filter gave good results from the first, when [illegible] and after the filter had only been in operation for a few days, nearly 60 parts of nitrate per 100,000 showed in the effluent, while free nitric acid was found to be present.

The following analysis shows the nature of the [illegible]

	Parts per 100,000
[illegible]	[illegible]
Albuminoid ,,	·09
Nitric ,,	58·5
[illegible]	
ganate	·42
[illegible]	·57
Suspended [illegible] ...	·9

The volume of diluting water was subsequently reduced to about 50 per cent of the piggery sewage, after the filter had been running for about a couple of months, the effluent still remaining of high quality. The figures for nitric nitrogen dropped to about 16 parts per 100,000, the suspended solids rising to about 1 part.

Dust Prevention.—The Crown Estate Commissioners [illegible]

Councillors and Road Maintenance.—[illegible] have adopted a proposal of the Highway Committee with respect to responsibility for the maintenance of the roads. This is that each year, before the scheme of work for the following year is drawn up, the committee should personally visit the different parishes in the district and acquaint themselves with the condition of the roads and the requirements of the different areas. The committee did not suggest that the surveyor's discretion in undertaking local repairs from time to time should in any way be impaired, but they felt that if the members assumed direct responsibility for the preparation of the main programme it would be possible to secure greater continuity of policy and to lessen local grievances by a personal inquiry into local needs on the spot.

* The figure for chlorine is sometimes as high as 50 parts per 100,000 —G. B. K.

Definitions of Road Terms.

AMERICAN ENGINEERING SOCIETY'S RECOMMENDATIONS.

[The appended matter forms the concluding portion of the recently-presented report of the Special Committee on Bituminous Materials for Road Construction and on Standards for their Test and Use, appointed by the American Society of Civil Engineers. The first part of the report, reproduced in our issue of March 5th, set out the Committee's suggestions regarding the analysis and testing of bituminous materials and their conclusions on the subject generally.]

For the sake of uniformity and clearness, the committee recommends that the following lists of terms or frequent use in expressions relating to highway work be recognised as having the meanings set forth in the list, unless otherwise definitely stated at any time by a user of such term or terms. The committee further recommends that new terms or phrases, coined with the idea of expressing delicate shades of meaning through the medium of one or two words rather than by longer expressions, be suggested or used only after full, careful, and conservative consideration for the sake of avoiding to the utmost further confusion in the use of terms. In the list given will be found some terms and definitions adopted by the American Society for Testing Materials, others by the American reporter on Communication No. 10 at the Third International Road Congress, and other terms and definitions which have been proposed by the Committee on "Standard Tests for Road Materials" of the American Society for Testing Materials. The committee wishes to acknowledge here its obligations for suggestions thus reaching it.

DEFINITIONS.

Aggregate.—The mineral material, such as sand, gravel, shells, slag, or broken stone, or combinations thereof, with which the cement or the bituminous material is mixed to form a mortar or concrete. Fine aggregate may be considered as the mineral inert material which will pass a ¼-in. screen, and coarse aggregate the material which will not pass a ¼-in. screen.

Asphalt.—Solid or semi-solid native bitumens, solid or semi-solid bitumens obtained by refining petroleums, or solid or semi-solid bitumens which are combinations of the bitumens mentioned with petroleums or derivatives thereof, which melt on the application of heat, and which consist of a mixture of hydrocarbons and their derivatives of complex structure, largely cyclic and bridge compounds.

Asphalt Block Pavement.—One having a wearing course of previously prepared blocks of asphaltic concrete.

Asphalt Cement.—A fluxed or unfluxed asphaltic material, especially prepared as to quality and consistency, suitable for direct use in the manufacture of asphaltic pavements, and having a penetration of between 5 and 250.

Asphaltenes.—The components of the bitumen in petroleum, petroleum products, malthas, asphalt cements, and solid native bitumens, which are soluble in carbon disulphide, but insoluble in paraffin naphthas.

Asphaltic.—Similar to, or essentially composed of, asphalt.

Base.—Artificial foundation.

Binder.—(1) A foreign or fine material introduced into the mineral portion of the wearing surface for the purpose of assisting the road metal to retain its integrity under stress, as well as perhaps to aid in its first construction. (2) The course, in a sheet-asphalt pavement, frequently used between the concrete foundation and the sheet-asphalt wearing surface, composed of graded sand and asphalt cement.

Bitumen.—A mixture of native or pyrogenous hydrocarbons and their non-metallic derivatives, which may be gases, liquids, viscous liquids, or solids, and which are soluble in carbon disulphide.

Bituminous Cement.—A bituminous material suitable for use as a binder having cementing qualities which are dependent mainly on its bituminous character.

Bituminous Concrete Pavement.—One composed of stone, gravel, sand, shell, or slag, or combinations thereof, and bituminous materials incorporated together by mixing methods.

Bituminous Macadam Pavement.—One having a wearing course of macadam with the interstices filled by penetration methods with a bituminous binder.

Bituminous Material.—Material containing bitumen as an essential constituent.

Liquid Bituminous Material.—Bituminous material showing a penetration at normal temperature under a load of 50 grammes applied for one second of more than 350.

Semi-solid Bituminous Material.—Bituminous material showing a penetration at normal temperature under a load of 100 grammes applied for five seconds of more than 10, and under a load of 50 grammes applied for one second of not more than 350.

Sold Bituminous Material.—Bituminous material showing a penetration at normal temperature under a load of 100 grammes applied for five seconds of not more than 10.

Bituminous Pavement.—One composed of stone, gravel, sand, shell or slag, or combinations thereof, and bituminous materials incorporated together.

Bituminous Surface.—A superficial coat of bituminous material with or without the addition of stone or slag chips, gravel, sand or material of similar character.

Blanket.—See "Carpet."

Bleeding.—The exudation of bituminous material on the roadway surface after construction.

Blown Petroleums.—Semi-solid or solid products produced primarily by the action of air upon originally fluid native bitumens which are heated during the blowing process.

Bond.—The combined action of inertia, friction, and of the forces of adhesion and cohesion which helps the separate particles composing a crust or pavement to resist separation under stress. Mechanical bond is the bond produced almost wholly, in a well-built broken-stone macadam road, by the interlocking of angular fragments of stone and the subsequent filling of the remaining interstices with the finer particles.

Bound.—Bonded.

Water-bound.—Bonded with the aid of water.

Bituminous-bound.—Bonded with the aid of bituminous material.

Brick Pavement.—One having a wearing course of paving bricks or blocks.

Bridge.—A structure for the purpose of carrying traffic over a gap in the road-bed measuring 10 ft. or more in the clear span.

Camber of a Road.—See "Crown."

Camber of a Bridge.—The rise of its centre above a straight line through its ends.

Carbenes.—The components of the bitumen in petroleums, petroleum products, malthas, asphalt cements, and solid native bitumens, which are soluble in carbon disulphide, but insoluble in carbon tetrachloride.

Carpet.—A bituminous surface of appreciable thickness, generally formed on top of a roadway by the application of one or more coats of bituminous material with gravel, sand or stone chips added.

Cement.—An adhesive substance used for uniting particles of other materials to each other, ordinarily applied only to calcined "cement rock," or to artificially prepared, calcined and ground mixtures of limestone and silicious materials. Sometimes used to designate bituminous binder used in bituminous pavements, when the expression "bituminous cement" (q.v.) is understood to be meant.

Cement Concrete.—An intimate mixture of gravel, shell, slag or broken stone particles with certain proportions of sand or similar material, cement, and water, made previous to placing.

Cement Concrete Pavement.—One having a wearing course of hydraulic cement concrete.

Cemented.—Bonded. Referring to water-bound macadam, the term "cemented" is used to designate that condition existing when, after rolling the stone forming the crust, the remaining voids have been filled with the finer sizes, and the stone dust or "flour" has, under the action of water, "set" as does cement itself.

Chips.—Small angular fragments of stone, coarser than grit.

Clay.—Finely divided earth, generally silicious and

atuminous, which will pass a 200-mesh sieve. Also see "Gravel."

Coal Tar.—The mixture of hydrocarbon distillates, mostly unsaturated ring compounds, produced in the destructive distillation of coal.

Coat.—See "Carpet." (1) The total result of one or more single surface applications. (2) To apply a coat.

Coke-oven Tar.—Coal tar produced in by-product coke ovens in the manufacture of coke from bituminous coal.

Consistency.—The degree of mobility or fluidity of bituminous materials.

Course.—One or more layers of road metal placed and compacted separately, for the formation of the road or pavement. Courses are usually referred to in the order of their laying as first course, second course, third course, &c., or as a single road block in a pavement.

Crown.—The rise in cross-section from the sides to the highest part of the finished roadway. It may be expressed either as so many inches per foot of width, or as a fraction per foot of distance from side to centre—*i.e.*, "the crown is 4 in.," or "the crown is ¼ in. to the foot."

Crusher Run.—The total unscreened product of a stone crusher.

Crusher-run Stone.—The product of a stone-crusher, unscreened except for the removal of the particles smaller than remaining on about a ¼-in. screen.

Crust.—That portion of a macadam or similar roadway above the foundation consisting of the road metal proper with its bonding material or binder.

Culvert.—A structure for the purpose of carrying traffic over a gap in the road-bed, measuring less than 10 ft. in clear span.

Cut-back Products.—Petroleum, or tar residuums, which have been fluxed, each with its own or similar distillates.

Dead Oils.—Oils, which are heavier than water, which are distilled from tars.

Dehydrated Tar.—Tar from which the water has been removed.

Ditch.—The open-side drain of a roadway, usually deep in proportion to its width, and unpaved.

Drainage.—Provision for the disposition of water.

Side Drainage.—That along the sides of the roadway.

Sub or Under Drainage.—That below the surface.

Surface Drainage.—That on the roadway or ground surface.

V Drainage.—That provided by the construction of troughs in the sub-grade of the roadway, which troughs are like a V, with flat, sloping sides, and are filled with stone.

Dust.—Earth or other matter in fine, dry particles, so attenuated that they can be raised and carried by air currents. The product of the crusher passing through a fine sieve.

Dust-layer.—Material applied to a roadway for temporarily preventing the formation or dispersion under traffic of distributable dust.

Earth Road.—A roadway composed of natural earthy material.

Emulsion.—A combination of water and oily material made miscible with water through the action of a saponifying or other agent.

Expansion Joint.—A separation of the mass of a structure, usually in the form of a joint filled with elastic material, which will provide opportunity for slight movement in the structure.

Fat.—Containing an excess. A fat asphalt mixture is one in which the asphalt cement is in excess, and the excess is clearly apparent.

Filler.—(1) Relatively fine material used to fill the voids in the aggregate. (2) Material used to fill the joints in a brick or block pavement.

Fixed Carbon.—The organic matter of the residual coke obtained upon burning hydrocarbon products in a covered vessel in the absence of free oxygen.

Flour.—Finely ground rocks or minerals pulverised to an impalpable product.

Flush Coat.—See "Seal Coat."

Flushing.—(1) Completely filling the voids. (2) Washing a pavement with an excess of water.

Flux.—Bitumens, generally liquid, used in combination with harder bitumens for the purpose of softening the latter.

Footway.—The portion of the highway devoted especially to pedestrians. A sidewalk.

Foundation.—The portion of the roadway below and supporting the crust or pavement.

Artificial Foundation.—The layer of the foundation especially placed on the sub-grade for the purpose of reinforcing the supporting power of the latter itself, and composed of material different from that of the sub-grade proper.

Free Carbon.—In tars, organic matter which is insoluble in carbon disulphide.

Gas-house Coal Tar.—Coal tar produced in gas-house retorts in the manufacture of illuminating gas from bituminous coal.

Grade.—(1) The profile of the centre of the roadway, or its rate of rise or fall. (2) Elevation. (3) To establish a profile by cuts and fills or earthwork. (4) To arrange by sizes broken stone, gravel, sand or combinations of such materials.

Gravel.—Small stones or pebbles usually found in natural deposits, more or less intermixed with sand, clay, &c., but in which mixture the particles which will not pass a ten-mesh sieve predominate. Gravel clay, gravel sand, clayey gravel, and sandy gravel indicate the varying proportions of the finer-sized particles. The differentiation between gravel, sand, silt and clay should be made on the following basis:—

Size of particles	Names
Retained on a ¼-in. mesh	Gravel
Passing a ¼-in. mesh and retained on a 200-mesh	Sand
Passing a 200-mesh sieve	Silt or Clay

Pea Gravel.—Clean gravel the particles of which [illegible] gravel from [illegible] fine) material.

Gutter.—The artificially surfaced and generally shallow waterway provided usually at the sides of the roadway for carrying surface drainage. Occasionally used synonymously with "ditch," but incorrectly so, as "gutters" are always paved or otherwise surfaced, and ditches are not.

Hermetic.—The [illegible] of a roadway. Sometimes also called "quarters."

Highway.—The entire right of way devoted to public travel, including the sidewalks and other public spaces, if such exist.

Layer.—A [illegible] application.

Loam.—Finely divided earthy material containing a considerable proportion of organic matter.

Macadam.—A road crust composed of stone or similar material broken into irregular angular fragments compacted together so as to be interlocked and mechanically bound to the utmost possible extent.

Mastic.—A mixture of bituminous material and fine mineral matter suitably made for use in highway construction and for application in a heated condition.

Mat.—See "Carpet."

Matrix.—A composition or material forming a cushion, or binding the aggregate together.

Mesh.—The square opening of a sieve.

Metal.—See "Road Metal."

Mortar.—A mixture of fine material, such as sand, cement, and water or other liquid suitably proportioned, and incorporated together for the purpose for which it is used.

Mush.—A greasy mud sometimes found on bituminous crusts.

Normal Temperature.—In laboratory investigations 25 deg. Cent. (77 deg. Fahr.).

Oil-gas Tars.—Tars produced by cracking oil vapours in the manufacture of oil gas.

Patching.—Repairing or restoring small isolated areas in the surface of the metalled or paved portion of the highway.

Palliative.—A short-lived dust-layer.

Pavement.—The wearing course of the roadway or footway when constructed with a cement or bituminous binder, or composed of blocks or slabs, together with any cushion or "binder" course.

Penetration.—In laboratory investigations the distance, expressed in tenths of a millimetre, entered a sample by a No. 2 cambric needle operated in a machine for the purpose and under known conditions of loading, time and temperature. The degree of solidity of bituminous materials. In construction, the entrance of bituminous material into the interstices of the metal of the roadway.

Penetration method.—The method of constructing a bituminous macadam pavement by pouring or grouting the bituminous material into the upper course of the road metal before the binding of the latter has been completed.

Pitch.—Solid residue produced in the evaporation or distillation of bitumens, the term being usually applied to residue obtained from tar.

Hard Pitch.—Pitch showing a penetration of not more than 10

Soft Pitch.—Pitch showing a penetration of more than 10.

Straight-run Pitch.—A pitch run in the initial process of distillation to the consistency desired without subsequent fluxing.

Pocket.—A hole or depression in the wearing course.

Pothole.—A hole extending below the wearing course.

Profile.—A longitudinal section of a highway, generally taken along the centre line.

Quarters.—The four sections of equal width which, side by side, make up the total width of a roadway.

Ravelling.—The loosening of the metal composing the crust.

Refined Tar.—A tar freed from water by evaporation or distillation, which is continued until the residue is of desired consistency, or a product produced by fluxing tar residuum with tar distillate.

Renewals.—Extensive repairs over practically the whole surface of the metalled or paved portion of the highway.

Repairs.—The restoration or mending of a considerable amount of the metalled or paved portion of the highway, but not usually of a majority of the surface area. More extensive than "Patching," but less so than "Renewals."

Resurfacing.—The renewal of the surface of the crust or pavement.

Road.—A highway outside of an urban district.

Road-bed.—The natural foundation of a roadway.

Road Metal.—Broken stone, gravel, slag, or similar material used in road and pavement construction and maintenance.

Roadway.—That portion of a highway particularly devoted to the use of vehicles.

Rock Asphalt.—Sand-stone or lime-stone naturally impregnated with asphalt.

Rock Asphalt Pavement.—A wearing course composed of broken or pulverised rock asphalt with or without the addition of other bituminous materials.

Sand.—Finely divided rock detritus, the particles of which will pass a 16-mesh and be retained on a 200-mesh screen. Also see "Gravel."

Sand-clay Road.—A roadway composed of an intimate mixture of sand and clay.

Scarify.—To loosen and disturb superficially.

Screen.—In laboratory work an apparatus, in which the apertures are circular, for separating sizes of material.

Screenings.—Broken rock of a size that will pass through a ½-in. to ¾-in. screen, depending on the character of the stone.

Seal Coat.—A final superficial application of bituminous material during construction to a bituminous pavement.

Setting Up.—The relatively quick change such as takes place in a bituminous material after its application to a roadway, indicated by its hardening after cooling and exposure to atmospheric and traffic conditions, as opposed to the slower changes later occurring gradually and almost imperceptibly.

Shaping.—Trimming up and preparing a rut or track preparatory to applying the first course of the road metal or artificial foundation.

Sheet-asphalt Pavement.—One having a wearing course composed of asphalt cement and sand of predetermined grading, with or without the addition of fine material, incorporated together by mixing methods.

Sheet Pavement.—A pavement free from frequent joints such as would accompany small rectangular blocks and which has an appreciable thickness (say, in excess of 1 in. on the average) for its wearing course.

Shoulders.—The portion of the highway between the edges of the road metal or pavement and the gutters, slopes, or watercourses.

Side Drain.—See "Drainage."

Sidewalk.—The portion of the highway reserved for pedestrians.

Sieve.—In laboratory work an apparatus, in which the apertures are rectangular, for separating sizes of material.

Silt.—Naturally deposited fine earthy material, which will pass a 200-mesh sieve. Also see "Gravel."

Spalls.—Fragments broken off by a blow, irregular in shape, and of such size to be convenient to the original mass.

Squeegee.—A tool with a rubber or leather edge for scraping or cleaning hard surfaces, or for spreading and distributing liquid material over and into the superficial interstices of roadways.

Squeegee Coat.—An application by means of the squeegee.

Stone Block Pavement.—One having a wearing course composed of stone blocks quite or nearly rectangular in shape.

Street.—A highway in an urban district.

Sub-grade.—The upper surface of the native foundation on which is placed the road metal or the artificial foundation, in case the latter is provided.

Superficial Coat.—A light surface coat.

Surface Coat.—See "Carpet."

Surfacing.—(1) The crust or pavement. (2) Constructing a crust or pavement. (3) Finally finishing the surface of a roadway. (4) Treating the surface of a finished roadway with a bituminous material.

Surface Treatment.—Treating the finished surface of a roadway with bituminous material.

Tailings.—Stones which after passing through the crusher do not pass through the largest openings of the screen.

Tar.—Bitumen which yields pitch upon fractional distillation and which is produced as a distillate by the destructive distillation of bitumens, pyro-bitumens, or organic material.

Telford.—Properly an artificial foundation advocated by Thomas Telford (1757-1820), and consisting of a pavement of stone about 8 in. thick, laid by hand, and closely packed and wedged together. The individual stones were desired to be about 16 sq. in. in section, and about 8 in. in length. They were set close together on the prepared sub-grade, their longest dimension vertical and on their larger ends, their interstices chinked with smaller stones, and the whole rammed (or rolled) until firm and unyielding.

Telford Macadam.—Macadam with an artificial foundation of Telford.

Under-drain.—See "Drainage."

Upkeep.—Maintenance.

V Drain.—See "Drainage."

Viscosity.—The degree of fluidity of bituminous materials.

Volatile.—Applied to those fractions of bituminous materials which will evaporate at climatic temperatures.

Water-bound.—Bound or bonded with the aid of water.

Water-gas Tar.—Tar produced by cracking oil vapours in the manufacture of carburetted water-gas.

Wearing Coat.—The superficial layer of the crust or pavement exposed to traffic.

Wearing Course.—The course of the crust or pavement exposed to traffic.

Wood Block Pavement.—One having a wearing course composed of wood paving blocks, generally rectangular in shape.

The committee has carefully considered the advisability of presenting a progress report on "Materials other than Bituminous." Owing to the time which it has been obliged to devote to the above report on "Bituminous Materials," it has been unable to consider any but the most general questions relating to other materials. The committee has been impressed with the fact that there is a wide divergence of opinion and of practice with respect to the use of such materials, but that it might attempt to present some standards and principles which are fairly well defined and quite generally accepted, and to suggest other matters which should receive attention and be made the subject of investigation by highway engineers. The majority of the committee feels, however, that it should defer a progress report on "Materials other than Bituminous" until [illegible] sions.

The Roads of Flanders. A correspondent of the *Daily Telegraph* writes from France [illegible] about the present condition of the roads in Flanders. "The country is [illegible] of the hedges or the fences of our English countryside, there are the 'roads.' They vary from the good, if horribly jolty, paved highway to the small cross roads, which are now but little better than mud canals. Many years ago our Army learned to swear in Flanders. It is a necessary part of the soldier's equipment in this part of the country, and the two great objects of his eloquence are the mud and the roads. Yet thanks to the [illegible] have worn wonderfully well. They go to pieces here and there [illegible] displaying their ingenuity; but, on the whole, they have been the most [illegible] success."

THE NATIONAL ROAD CONFERENCE AND EXHIBITION (1915).

We are informed that a National Road Exhibition has been organised by the County Councils Association of England and Wales to take place from June 30th next to July 1st at the Royal Horticultural Hall, London. At the same time there will be held a conference at which important points connected with the road question will be discussed. The dates of the conference and exhibition partly coincide with the dates of the annual meeting of the Institution of Municipal and County Engineers, which will be held in London this year.

The County Councils Association has been invited to take part in the organisation of the conference and exhibition by representatives of the Road Board and by borough and district surveyors. The Organising Committee, which will be further enlarged, includes at present:—

The Right Hon. H. Hobhouse (chairman of the Somerset County Council, Bruton).
Mr. J. Aspden (chairman of the Local Government Committee).
Mr. H. Hampden (Clerk of the Road Board to the National Road Board).
Colonel G. Dixon (chairman of the Oxford County Council).
Sir H. George Fordham (surveyor to the Cambridgeshire County Council).
Mr. Frank Harris (engineer and surveyor to the Tonbridge Rural District Council).
Mr. T. H. B. Hesketh (county surveyor of Norfolk).
Mr. W. Rees Jeffreys (secretary to the Road Board).
Mr. A. C. Pain (chairman of the Special Highways Committee).
Mr. R. S. W. Pickering (county surveyor of the Isle of Ely).
Mr. Dudley Roberts (vice-president of the Institution of Municipal and County Engineers).
Mr. O. C. Robinson (surveyor to the Wimbledon Urban District Council).
Mr. Norman Scott (borough engineer and surveyor, Hackney).
Mr. Henry E. Stilgoe (city engineer and surveyor, Birmingham).
Mr. H. T. Wakelam (county engineer of Middlesex, and president of the Institution of Municipal and County Engineers).

The organising secretary is Mr. G. Montagu Harris, secretary of the County Councils Association, and Mr. Frances Hyndman is assistant secretary.

The preliminary arrangements regarding the dates of the conferences and meetings are as follows:—

June 7th and 8th.—Annual meeting of the Institution of Municipal and County Engineers, when the following subjects will be discussed:—

(1) The improvement and maintenance of highways in connection with modern traffic conditions.
(2) The use of reinforced concrete in building, road construction, &c.
(3) Town Planning.
(4) Haulage by mechanical motive power from an economical point of view.
(5) Restriction and control of heavy traffic, both as regards weight and speed.
(6) The maintenance and strengthening of steel and steel bridges.

June 8th.—Conference on "The Adequacy of Bituminous Roads with special reference to the subject of Corrugations," and other matters.

June 9th.—Conference on "Heavy Traffic."

June 10th.—Morning: Meeting of Executive Council of County Councils Association. Afternoon: Conference on the "Classification of Roads."

July 1st.—Conference on "The Reconstruction of Roads in Belgium," arranged jointly by the County Councils Association and a special committee which has been formed in connection with the rebuilding of Belgium.

Arrangements as to other meetings on the above days will be announced separately as soon as the full programme is definitely settled.

We understand that invitations will be sent not only to county councils, but to all local authorities in the Kingdom for the attendance of members of their Highway Committee, engineers, surveyors and clerks, also to members of Parliament, to French, Belgian and other foreign engineers in this country, and to all societies and institutions who are concerned with the control and care of roads. The conference on July 1st on the reconstruction of roads in Belgium is one of a series on the reconstruction of Belgium inaugurated by the conference at the Guildhall in February last, which received such cordial support from Belgian and British authorities.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

EASTERN DISTRICT MEETING AT WESTMINSTER.

Mr. H. T. Wakelam, the president-elect, occupied the chair at the Eastern District meeting of the Institution of Municipal and County Engineers held on Saturday afternoon last at the institution offices, the attendance including Messrs. J. S. Pickering (president), E. Willis (Chiswick), J. W. Cockrill (Great Yarmouth), E. J. Elford (Southend-on-Sea), A. E. Collins (Norwood), F. W. Pearce (Twickenham), R. R. Hogsden (Middlesex), H. F. Wilkinson (Tottenham), P. T. Hewitson (Cuckfield), E. Brown (Southall-Norwood), W. H. Prescott (Tottenham), W. Gornall (Hendon), J. Desborough (Willesden) and James A. Webb (Hendon, hon. secretary).

The minutes of the meeting at Tilbury were read, confirmed and signed by the chairman.

APPOINTMENT OF OFFICERS.

On the motion of Mr. Brown, and seconded by Mr. Willis, the whole of the retiring Executive Committee were reappointed with the substitution of the name of Mr. Pearce, of Twickenham, in place of Mr. C. Vawser (Hatfield), who had resigned on leaving the Eastern District.

Mr. Prescott moved and Mr. Willis seconded the re-election of Mr. Wakelam as chairman for the ensuing year, and this was carried unanimously.

On the motion of the chairman, seconded by Mr. Elford, the members resolved to support the nomination of Mr. J. A. Webb as one of the Eastern District representatives on the council for the ensuing year.

Mr. Elford proposed and Mr. Cockrill seconded the nomination of Mr. Willis as the other representative of the Eastern District on the council for the coming year. This was agreed to unanimously.

Mr. Webb moved and Mr. Brown seconded the resolution to invite Mr. H. Collins, of Colchester, to take over the position of hon. secretary of the Eastern District for the year 1915 to 1916. The motion was carried.

On the motion of Mr. Webb, seconded by Mr. Willis, it was decided to elect Mr. F. W. Smart, of Bedford, as sub-district secretary for the counties of Beds, Bucks and Northants.

MOTORS AND ROADS.

The appointment of a departmental committee to discuss the questions of loads, diameter and width of tyres on motor vehicles using roads, and the question of by-laws, was mentioned by several members, and the general opinion was expressed that these matters should be discussed and the opinion of each district obtained and forwarded to the council of the institution.

Arising out of the above discussion, it was proposed by Mr. Brown and seconded by Mr. Prescott "that, as a general principle, the attention of the council be drawn to the appointment of departmental committees selected to take evidence and discuss matters affecting the institution, and that the council be asked to obtain the opinion of each district on these matters."

The motion was carried unanimously.

Mr. Brown agreed to a meeting being held at Southall any Saturday afternoon convenient to the members. The arrangements were left in the hands of the secretary.

The customary vote of thanks to the chairman for presiding was passed on the motion of Mr. Brown, seconded by Mr. Willis.

MATLOCK MEETING.

At the last meeting of Matlock Urban District Council it was agreed to give facilities for the holding of a meeting of the Institution of Municipal and County Engineers in that town in May next.

Disposal of Domestic and Trade Refuse.

SPECIAL COMMITTEE'S REPORT TO BERMONDSEY BOROUGH COUNCIL.

In June of last year Mr. R. J. Angel, M.INST.C.E., M.R.I.B.A., the borough engineer and surveyor, drew the attention of the General Purposes Committee of Bermondsey Borough Council to the advantages of the Patent Lightning Crusher Company's well-known system of treating refuse—already in operation in Southwark, Hove, Halifax, Glasgow, Ruislip, and other towns.

The borough engineer's suggestion had for its object the abolition of the dust and smell which is produced during burning, and of the clinker residue, which approximates to about one-third of the refuse consumed, and is difficult to get rid of without heavy expense to the council. At present only such description and quality of refuse is accepted as is sufficiently combustible and useful for raising steam, and an increasingly large quantity is constantly rejected and being diverted to the council's contractor for shooting either into a barge or on to land. In their report at the time the committee pointed out that the suggestions embraced the disposal of the dry road sweepings, and would therefore reduce the cost of shooting.

The committee went on to explain that under the system in question no clinker or flue dust was produced; on the contrary, the refuse would bear a judicious amount of furnace clinker from factories, which was now refused by the dust destructor, particularly had to be paid for on disposal, being [illegible]. Under the present arrangements of the [illegible] naturally frequently happened that vans which [illegible]d at 4 or 5 o'clock p.m. were still loaded [illegible] the morning, and ten or twelve carmen had to wait until from 6 o'clock to 7 or 7.45 a.m. for the vans to be unloaded, as the cells had not consumed the quantity shot overnight, thus causing serious delay. Under the new arrangements this would not occur, as the plant would deal with the refuse as collected from 6 a.m. to 5 p.m., there being no delay in waiting for a cell to consume its charge. It was added that the resulting material from the plant possessed high fertilising properties, and was purchased by the farmers from the borough of Southwark, who were unable to meet all the demands made on them.

The operation of the plant was explained as follows:—

The refuse was taken to the plant in the covered vans as collected, when it was [illegible] from the hoppers. The large tins only were thrown on one side and disposed of as at present, the contractors paying the council £1 6s. per ton for bright tins, and 2s. per ton for rough metal. The whole of the dust was then shovelled into a perforated chamber in which four hammers revolved at a speed of 1,200 revolutions per minute, the result being that during the course of sixty seconds an article would receive 4,800 blows delivered with considerable force so that the dust, ashes, garbage, and even the smaller tins and paper were reduced to coarse powder, falling into a travelling conveyor and discharging direct into a van, wagon or barge as the case might be.

It was suggested that a plant of this type should be fixed in the old destructor house at Rotherhithe, and the crushed refuse material delivered into barge for shipment to farmers. In order to deal with the whole of the council's collection of dust and trade refuse, which amounted to a maximum of about 85 tons per day, three cells would be required, and one spare cell as a stand-by for repairs or accident. The old destructor building was complete and in working order, together with its inclined roadway, and was ready for the first two hoppers, but for the next two the tipping floor must be extended. It was suggested that the building and land now used for the dust destructor might be transferred to the electric light department for extensions of their plant, while capital charges of the dismantled cells and furnaces were charged to the new scheme.

The proposal being regarded as worthy of consideration, a special committee was, on the recommendation of the committee, appointed to report on the matter. This committee subsequently saw the Southwark plant in operation, and as a result gave instructions for the preparation of a report showing what the cost would be if the council decided to deal with the existing destructor and erect plant at Rotherhithe. They also directed that [illegible] should be issued inviting offers from farmers, dairymen and horticulturists for the resultant material; to these, however, there was no response. An offer had, however, been made to remove the whole material free on board, and keep the council clear.

The committee, in their report to the council on Tuesday, submitted the following tables:—

COST OF PLANT.

The total cost of the whole of the plant is as follows:—

	£	£
Conveyor	400	
Crushers (four)	1,600	
Shafting, pulleys, &c.	240	
Erection	100	
Four 40 b.h.p. motors at £100	400	
One 4 b.h.p. motor at £25	25	
		2,765
Foundations for motors &c., extension of tipping floor		295
General repairs to building		120
Total cost of plant and building operations		£3,180

CAPACITY OF PLANT AND PARTICULARS OF DUST COLLECTION.

The output of each cell is guaranteed at 4 tons, or 3 tons in actual working, or 90 tons for the three working cells per day of ten hours. The average daily collection of council's dust and trade refuse is as follows, in tons:—

	House refuse. Tons.	Trade refuse. Tons.
Monday	80	5
Tuesday	67	3½
Wednesday	56½	1½
Thursday	55	1½
Friday	54½	2
Saturday	46½	2

During the year 1913 the following amount of refuse was disposed of:—

	Tons. Cwt.	Equal to a weekly collection of Loads.	Tons.
House refuse			
To destructor, 11,143 loads	17,162 19	214	330
To barge or shoot, 185 ,,	284 19	3½	5
Trade refuse			
To destructor, 1,470 ,,	1,365 16	28	26
To barge or shoot, 626 ,,	581 12	12	11
An annual total of 19,395 tons on an average weekly total of say, 20,000 tons per annum		257	372

The dry road sweepings from the Rotherhithe area, which contain a good deal of manure, can be added to the crushed material, and so reduce the cost of shooting.

ANNUAL COST OF RUNNING PLANT.

The cost of running the plant will be as follows for three cells in operation:—

	£ s.	£ s.
Labour—		
2 men per cell feeding, 6 men at 35s. 6d.	553 16	
1 leading hand capable of attending to machinery at 40s.	104 0	
1 man running barge at 35s. 6d.	92 6	
1 man removing, attending on men at cells at 35s. 6d.	92 6	
		842 8
Electric current for motors to cells on an actual running of 8 hours per day (variable load) and current for conveyor taken on a constant running of 10 hours per day		650 0
Upkeep of plant		100 0
Repairs and upkeep of building		25 0
Add for additional cartage		150 0
Part wages of watchman		50 0
Depot charges		300 0
Capital charges on plant for 10 years		366 0
Average capital charges on disused cells and furnaces at destructor for next 6 years from April 1st, 1915		262 6
		3,045 14
Credit sale of old tins		160 0
Total cost per annum		£2,885 14

It would be noted that a sum [illegible] included for additional cartage which would be entailed in taking

the refuse to Bull Hurst Road, it would pay to be rid of the destructor.

DISPOSAL OF MUNICIPAL ASHES, REFUSE, &c.

The borough of Southwark covers 1,207 acres, and has a population of 231,000. It is under contract to deliver the ashes, refuse, &c., from the plant at the rate of 4s. per ton. Charges on the plant as it now stands are £1,500 per annum, and when the new plant is completed the annual charges will be £2,000. The following is a statement of the cost of crushing and disposal at Southwark:—

Month of June, 1913.

	s.	d.
Total cost of crushing	3	4 per ton.
Carriage to country [illegible] from London	4	8
	7	11
Receipts from owners for ashes, refuse, &c.	3	7
Cost to ratepayers	4	4 per ton.

(which covers all expenses of the Dust Destructor Department).

COST PER TON FOR CRUSHING.

The [illegible] amounted to £2,880 14s. 6d., which works out at 1 ton 2 cwts. per hour. The refuse is crushed. If the dust and garbage from Bermondsey is mixed with the crushed refuse it will save £100 per month, and reduce the cost of crushing to 2s. 9d. per ton.

The cost of disposing of the refuse and dust resulting from the destruction for the year ended 1913 was 4s. 7.8d. per ton, and for the year 1913-14 it was 4s. 10.5d. per ton, so that the difference between the two years would be £2,000 per annum on the last-mentioned figure, exclusive of the standing charges for the building, land, boilers, &c., amounting to £1,205 12s. 9d., thus reducing the income to £1,796.

The committee thought it was possible that alterations in the method of destruction and disposal might be made which would be more profitable still to the council, and that, even should the estimated saving not be realised, it would still be a very great advantage to have the ashes dealt with in the borough. They accordingly recommended that tenders should be invited for the erection of plant. On Tuesday the Finance Committee of the council recommended that a loan of £6,000 be granted, subject to the approval of the Treasury being given to the expenditure. The necessary steps would be taken to obtain a loan of £1,250 for the purpose of carrying out the scheme.

Middleton Sewage Works. The Middleton Town Council and the Manchester Corporation have agreed to pay to Mr. James Daggle the sum of £800 to be equally borne by the authorities for preparing a scheme of sewerage for Middleton which was eventually abandoned in favour of handing over the treatment and disposal of the sewage of Middleton to the Manchester Corporation. The Middleton Corporation have now decided to hand over the present sewage works to the Manchester Corporation. Manchester is giving £10,000 for the consideration. Middleton is also to be indemnified against any action by the Mersey and Irwell Joint Committee.

The Height of Buildings.—The Doncaster Corporation Bill was before the Local Legislation Committee last week, and was ordered to be reported to the House of Commons for third reading. Some discussion took place on Clause 77, dealing with the height of new buildings. The borough surveyor, Mr. F. O. Kirby, stated that the clause as to 30 ft. was not that height was asked for because it was found that with a height of 30 ft. it was possible to put on a third story, which was not deemed advisable. There were at the present time in Doncaster shops of over 30 ft. in height. Employees slept in these, and he was apprehensive that as the development of Doncaster shops might be built to a greater height which was not desirable. The chairman, Mr. Middlebrook, said the committee were with the promoters as the object it was desired to obtain, but they were a little in difficulty as to the provisions. They thought they would take the wise course if they passed the clause giving 35 ft. as the limit of height, not limiting anything in it as to the number of persons resident on the premises, but relying on the fact that the corporation was only to require such measures as were reasonably possible, with power to appeal in the impossible event of the clause not being interpreted in the required sense. The Bill authorises an expenditure of £50,000 for an isolation hospital, and £46,000 for works of street improvement.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Why [illegible] specially read the [illegible] of the Prime Minister to the Peace Conference with approbation after the appointment? Who was the politician who once stated that, in his opinion, "England worried through her wars [illegible] in spite of the Government"?

* * * *

Would not the excellent illustrated pamphlet by Mr. G. Bertram Hurst, surveyor to Alton Urban, entitled "The Surveyor on Military Service," be of [illegible] to surveyors who are at present in contact with military operations in this country, but [illegible] engineers, which has been incorporated with the City of London National Guard? Does it not show a patriotic spirit when a surveyor produces a work of this kind without receiving any *quid pro quo*?

* * * *

[illegible] that whether the present strikes are the fault of the men or the masters, the effect has been disastrous at this crisis, not only in preventing munitions of war reaching our troops and those of our Allies, but particularly in the moral [illegible] neutral nations, who naturally believe that this country is not [illegible] bring the war to a successful issue? Do those responsible for the strikes reflect that every hour's delay means a prolongation of the war and further deaths and disablements among our brave countrymen who are defending our hearths and homes?

* * * *

[illegible] that the small domestic charcoal filter of the past, which was never very satisfactory, is giving way to larger mechanical filters in which cleanliness, as well as a complete filtration [illegible] is secured. Is not the [illegible] mechanical filter illustrated and explained in the issue of THE SURVEYOR of the 5th inst., and designed and manufactured by Messrs. Mather & Platt, "just the thing" for large houses, institutions, and so forth, but, above all, for the Front, [illegible] of the utmost importance?

* * * *

[illegible] issued by the Local Government Board with regard to the sufficient [illegible] of sewage may have the desired effect, and that the day is not far distant when we may all eat that delicious succulent bivalve with impunity and without that secret fear of dire consequences? Would it not have rejoiced the heart of the late Dr. Bulstrode to see that his labours were at last likely to bear fruit?

* * * *

Will it not be necessary before town planning can be carried out properly in this country to persuade the owners of land, especially the smaller owners, to see that it is in their interest to lay out the land on some larger plan than that which they think will produce the best monetary result? Will not this be exceedingly difficult in some cases where owners are only too willing to sell land to speculative builders without any restrictions? Is not the sale of land for building purposes becoming daily more difficult in the country, even in progressive suburbs?

Tiverton Rural Council's Difficulties.—Tiverton Rural District Council, owing to the difficulties of getting road materials, find themselves with an unexpended balance of over £1,000, and were on Tuesday able to set a rate of 2d. lower than the one for the corresponding half of last year. The surveyor, Mr. A. J. Mildon, said he had found it impossible to obtain a horse required for the haulage of stone.

Tar-painting of Wheel Tracks.—The Brechin District Committee of Forfarshire County Council have passed an estimate of £6,491 for road maintenance during 1915-16, and it was explained that £300 was set aside for the purpose of experimenting by tar-painting wheel tracks to a width of 4 ft. The experiments would be carried out on the Brechin, Forfar, and Lacrecrookrik roads, where there was most motor traffic. The cost would be £30 per mile.

The Use of Bituminous Material in Road Construction.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS DISCUSSION.

At last Saturday's meeting of the Institution of Municipal and County Engineers at which Mr. H. T. Welsford presided, a discussion on the use of bituminous material in road construction was opened by the president, Mr. J. S. Pickering.

The President said he would all agree that the question of bituminous material was one of the greatest importance, affecting almost any other in the case of the roads. The expression had a very wide meaning, and he thought very few of them could define what was really meant by it. Most of them, he thought, purchased their materials for road construction direct from the manufacturers, and few of them knew actually what they were getting, and he thought their knowledge in that connection would be greatly increased as a result of meetings of that kind. He hoped there was present someone whose familiarity with this complicated material was such that he could tell them something of the process of mixing with the aggregate, and exactly what tests to apply to enable them to know whether the material used was likely to be a success or not. At one time they were confined practically to crude tar, which gave indifferent results—sometimes it was a success and sometimes, for no apparent reason, a failure. Undoubtedly the composition of the tar varied very considerably according to the particular method of manufacture at the gasworks from which it was procured, but in most cases now he thought the use of crude tar had been abandoned, and other composition had taken its place. Even with distilled tar they did not appear to get the success with tar-macadamised roads they would like. Then they had the proprietary articles, which came to them under different names, but the actual composition of which they knew little. There was no doubt some of these were very valuable, and much superior to the ordinary or distilled tar. Another interesting matter was the question of the aggregate to be used in bituminous road construction. His own experience had been that limestone was preferable to granite for a sub-crust. He had had almost unvaried success with the use of tarred limestone, and had more failures where granite had been used. [The chairman: For surfacing as well.] He was speaking of the sub-crust. The road he had adopted had a foundation or sub-crust of tarred limestone, with a topping of tarred granite for the wearing surface. The tarred limestone seemed to retain its character better than granite. When a [illegible] road was broken open after [illegible] years' wear the material appeared still to possess some life, whereas tarred granite gave one the impression of having perished. Having laid many roads with the limestone sub-crust, he had come to the conclusion, [illegible] that it would take a certain amount of heavy traffic [illegible] consolidated. The best method [illegible] was to roll the [illegible] with a heavy roller, and then apply a coating of tarred granite—over the limestone. What was equally important was the after-sealing of the road, and that was a point they could not insist upon too strongly. He had used a foundation of 2½-in. gauge mixed with finer material; on top of that was ½ in. to ¾ in. of granite. That, however, was not sufficient [illegible] if a road was to last that it should be painted with some bituminous substance. What he used for the purpose was distilled tar mixed with a certain proportion of bitumen, the essential basis known as Key Compound. He [illegible] of Westrumite. That seemed a useful material, and they had covered about 10,000 sq. yds. of one of their roads with it. Westrumite was a kind of liquid asphalt with very peculiar properties. The advantage of using it was that it could be put on the road cold, and that it solidified about twelve or twenty-four [illegible] to was constructed in the manner he had described, and then painted with Westrumite, which, mixed with [illegible] forming a strong asphalt veneer. The only objection [illegible] to be that it was somewhat more slippery than an ordinary tar-painted road, but it appeared to have good wearing qualities, and its application did not depend entirely on dry weather. He had tried this material with a ½-in. carpeting, and it seemed successful. The idea of using the Westrumite was to avoid the yearly tar-painting, an offensive process—particularly in a residential town which he would be glad to see the end of. It was the painting and rolling that sealed a road, and prevented its disintegration. The Westrumite had only been down a few months, and not long enough, therefore, for him to express any opinion as to its ultimate value. Replying to the chairman, Mr. Pickering stated that he used Tytherington limestone in the system of construction he had adopted, and that where, under the previous water-bound methods, they had to resurface a road every two or three years, they had some roads which had already been down four years without any appreciable wear. The cost of surfacing with Westrumite worked out, he thought, at about 5d. per yard super.

Mr. E. Willis (who spoke on a road on which tarred slag had been put down on three successive occasions prior to his appointment), said that in each of these cases the result had been a total failure. The road, the traffic on which was now [illegible] tons a day, was about to be wood paved. He had laid a short length of Guernsey granite about five years ago, well grouted with tar after dry rolling. He then covered it with dry granite chippings, and, after tar-spraying it, put down a second coat of granite chippings. That road had not been touched since. Then he tried a short section of pitch grout, and made an excellent road, with the exception that very hot weather affected the pitch grout. Immediately adjoining he had a section of tarred granite macadam, which had been twice surface-coated since the pitch grout was put down, so that the pitch-grouted Guernsey granite had worn twice as long as the other. One thing he had found very successful was tarred clinker roads for light traffic. After scarifying, his method was to put on 4 in. of material and roll it down to 2 in. On top of this he put a coating of dry granite chippings, which seemed to fill the interstices and take up the surplus tar. Subsequent rolling produced a really excellent surface, and if he could only get enough clinker he would extend the system. Of the three kinds of coating he had experimented with—sand, shingle, and granite—granite had proved by far the best. He had abandoned the use of fine tarred granite for road surfacing. He always steam rolled [illegible] surfacing or spraying.

Mr. J. A. Webb (Hendon): Do you find your pitch-grouted road move in the hot weather?

Mr. Willis: Yes, the pitch creeps slightly; but I then add [illegible] granite chips.

Mr. E. J. Elford (Southend): I see, and he had seen clinker tar-macadam at Leicester a year or two ago; could Mr. Willis say anything about the mixing with the tar?

Mr. Willis: It uses a fair amount of tar, but it leaves no tar on the top, as this is all taken up by the dry granite chippings.

The President: Yes, that is so; it takes about 20 [illegible] per yard cube.

Mr. Elford remarked that at Southend the effect of 16 gallons to the yard cube was not satisfactory and his people got rather frightened.

Mr. Willis said he bought his material from the destructor department, and paid 7s. 6d. per yard cube [illegible]. For [illegible] year he paid per gallon [illegible] for the coming year the Road Board specification was somewhat less.

Mr. E. J. Lemon (Southend-on-Sea) said he had been experimenting with clinker tar-macadam, and [illegible] clinker on this material at any rate for the foundation coat. He had some trouble last year with slag tar-macadam, and thought manufacturers had great difficulty in keeping up the standard towards the end of the season owing to the heavy demand. He used over 10,000 tons during the year, and the proportion of failures was small; but they were annoying, and he should like to know the reason. He specified that the materials should be mixed twice—that was to say, mixed, and allowed to mature, and then mixed again. He thought this was

a large-gauge material, and attempted to fill up the interstices afterwards. He had tried a number of proprietary articles, but he confessed he often got a

almost all stones fit for road making—granite, at any rate—were practically non-porous and dry immediately upon crushing. His experience had been that a very fine light powder gave the best results as a filler, and he had found hot coal tar Portland cement or grouting quicklime convenient. With regard to granite, iron slag and limestone, so far as he could see, he got equally good results from all three, but he had had more failures with tarred granite than the others. However, since he had adopted the system of grouting up the interstices between the stones with hot sand and cement or lime, he had had no trouble. As to tar, he thought all who had gasworks in their neighbourhood ought to try and encourage the gas companies to prepare the tar with a special view to its use for roads. They should insist on the distillation going on until the creosote was to some extent removed and the anthracene was just being reached; if they went beyond that point and got to the pitch they would have trouble. Everything depended on the anthracene, and once that was gone they were not going to get good tar. As to the grouting, he agreed with Mr. Elford that one of the troubles of the system was the possibility of a shower of rain coming on just as one was about to commence grouting operations. He had had failures for this reason. Apart from this he thought it was the best of all systems for making bituminous roads. Mr. Collins went on to speak in

heating of stone as of great importance. It was absolutely essential that the stone should be dry. Practically almost all stones fit for road making—granite, at any rate—were practically non-porous and dry immediately upon crushing. His experience had been that a very fine light powder gave the best results as a filler, and he had found hot coal tar Portland cement or grouting quicklime convenient. With regard to granite, iron slag and limestone, so far as he could see, he got equally good results from all three, but he had had more failures with tarred granite than the others. However, since he had adopted the system of grouting up the interstices between the stones with hot sand and cement or lime, he had had no trouble. As to tar, he thought all who had gasworks in their neighbourhood ought to try and encourage the gas companies to prepare the tar with a special view to its use for roads. They should insist on the distillation going on until the creosote was to some extent removed and the anthracene was just being reached; if they went beyond that point and got to the pitch they would have trouble. Everything depended on the anthracene, and once that was gone they were not going to get good tar. As to the grouting, he agreed with Mr. Elford that one of the troubles of the system was the possibility of a shower of rain coming on just as one was about to commence grouting operations. He had had failures for this reason. Apart from this he thought it was the best of all systems for making bituminous roads. Mr. Collins went on to speak in

painting of ordinary water-bound macadam. His best results in this connection had, he said, been obtained by employing water-gas tar poured on hot, an application of hot distilled tar. Tar-painting for the quality of tar was likely to mislead unless accompanied by other tests.

Mr. J. W. [illegible] heavy traffic, which had been down in his town for the past twenty years, and which was not yet worn 8-in. concrete foundation, and the blocks, which were 4 in. in depth, were laid with a narrow joint. Jarrah was then cheaper than was now the case, and he was able to buy the blocks at the price of 7s. 8d. per yard that a considerable quantity had been laid, and more than ten years ago he reported to his council that this adam. Afterwards he experimented with bituminous and in 1914 30,000 yds., and carried out the work entirely without outside assistance, at a cost of 4s. 2d. per yard. Guernsey granite was bought at 9s. 6d. to him 7l. per ton. Mr. Cockrill concluded his remarks with some particulars of bitumen grouting which he has carried out in Great Yarmouth.

The discussion was adjourned until April 10th.

THE SHORTAGE OF LABOUR.

LOCAL GOVERNMENT BOARD'S CIRCULAR TO LOCAL AUTHORITIES.

rities the Local Government Board state that they have received from the Committee of Imperial Defence a communication in regard to the organisation of the labour force of the country in the present circumstances. In view of the needs of recruiting, and of the demand for labour for the manufacture of war materials, and for the production and transport of the necessary supplies for the population, the Committee [illegible] of releasing male labour of high physical quality, so stituting, where necessary, men of more advanced years, or, where the conditions allow, women workers.

The board are aware that local authorities generally have done much to facilitate the enlistment of those of their employees who are eligible for military service and who can be spared, and they are far from suggesting that the normal staffs should be depleted to such a degree that the services for which the local authorities are responsible could no longer be carried on with efficiency; but at a time when the vital interests of the country imperatively require that as many fit men as possible should be added to the Army, pered by lack of labour, and when the same cause gives rise to difficulties in the supply and transport of food, fuel, and other necessaries—difficulties which have largely contributed to the recent increase in prices—the Government are compelled to remind the local authorities of the importance of making adequate arrangements for utilising to the best advantage the available supply of labour. They would urge that only men who are indispensable for the work of the local authority should be refused permission to enlist; that artisans who belong to trades needed in the wherever possible, be released and encouraged to find employment there; and that where there is a demand for labourers on the railways, in the docks, and on farms, the local authority should facilitate the transfer to those employments of any men who can be spared, and who can there find suitable occupation and remuneration. In pursuance of this policy it will, the board point out, be necessary to economise labour to the greatest extent possible, and, where substitutes are needed, to engage only men who are not eligible for the Army and not suited for the occupations to which labour should be transferred. There

are some posts in which the employment temporarily of women in place of men may be practicable.

"At the outset of the war," the board proceed, "there was reason to fear that unemployment might be widespread. The Government Committee on the Prevention and Relief of Distress suggested to local authorities that they should have in readiness schemes for new works and buildings which could be put into operation in case serious unemployment should arise. Local authorities have in general responded to this suggestion, and in most cases such schemes are ready or in an advanced stage of preparation. Happily, however, after the first few weeks, the trade of the country recovered from its dislocation, and the enlistment of large numbers of men and the execution of war contracts have, in most districts, converted the problem to be faced from one of unemployment to one of shortage of labour. In these circumstances an opposite policy is indicated, and it becomes necessary to avoid the inception of all new works, except such as are of pressing necessity either for reasons of public health or on account of war requirements.

"Moreover, it is essential to see that capital as well as labour is made available in the directions in which it can best further the national interests during the war, and, as you are no doubt aware, the Lords Commissioners of His Majesty's Treasury have decided to restrict capital issues by local authorities, as well as by public companies, within the narrowest limits. After the termination of the war, when the men return from the Army and when the war contracts cease, it is possible that the question of unemployment may again become acute. The schemes for new works and buildings, which have been or are being prepared, would then be of the greatest value, and undertakings which are now reluctantly postponed owing to the need of economising both capital and labour could then be carried into effect with double advantage."

The board enclose with their circular a copy of the memorandum entitled "Officers of Local Authorities on Naval or Military Service," which they issued on August 21st last. In that memorandum the board indicated their view that local authorities might properly keep open the places of officers in their employment who joined His Majesty's Forces with their permission, and the board think that a similar view might, if the local authority were willing, apply to those persons in their employment who, in the present emergency, enter other employments. The board are aware that the policy which, in accordance with the conclusions of the Committee of Imperial Defence, they recommend may involve the employment by local authorities of less efficient labour, the postponement of many desirable works, and some public inconvenience; but they have no doubt that the difficulties will be faced and the inconvenience cheerfully borne in view of the needs of the time and the gravity of the issues at stake.

LOCAL AUTHORITIES' DIFFICULTIES

Local authorities, states the *Times*, are undoing difficulties in the way of complying with the request of the Local Government Board that they should release from municipal work men suitable for enlistment and for work in arsenals, dockyards, and armament factories. The chief complaint is that no definite plan for the suggested transfer of labour is set out in the Government circular, and that, anxious as the authorities are to assist the Government, there is likely to be a considerable wastage unless some machinery is provided to ensure the right men being drafted to the right places.

Already many municipalities are working with reduced staffs, and the quinquennial valuation, which will begin next month, will put further pressure on them. There are many departments of municipal work in which skilled men are engaged which must be carried on, and for which only expert workers are fitted. Chief of these are the electrical power stations and drainage and water works. Many municipalities, besides producing electricity for their own requirements, are under contract to supply manufacturers. Some of the men now engaged in street cleaning and the removal of house refuse could be spared, but any reduction of this work on a large scale would seriously interfere with public health.

ROAD BOARD CIRCULARS.

Surveyors to all local authorities having Road Board works in hand have received the following circular from the board's manager and engineer, Mr. H. P. Maybury, M.Inst.C.E.:

"I beg to refer to the above-mentioned proposal, and to say that the Road Board would be glad to know whether it would be possible for your council to defer proceeding with the scheme until more normal conditions obtain.

"At present the demand for labour and materials for urgent national requirements is such that it is extremely undesirable for highway authorities to press forward any schemes which could well be postponed, even though such postponement causes some local inconvenience.

"The policy on which the board are acting at the present time is based on the need of economising public expenditure, and of deferring works of road improvement except in cases where the work is necessary to prevent serious deterioration.

"From the information before the board it would appear that the proposal referred to—or, at least, portions thereof—might conveniently be postponed, and I am directed to ask your council to consider the advisability of taking this course.

"Your council will readily appreciate the necessity for conserving the resources of capital and labour, both of which are urgently needed for national purposes, and I am directed to say that, in the event of your council now having men engaged upon works which could properly be deferred, the board would be glad to avail themselves of the services of such men upon important road works which are being carried out in and around new military camps, for which a supply of men is now rather urgently required.

"I shall be happy to send you terms and conditions of employment if your council are in a position to render assistance.—Yours faithfully,

"H. P. Maybury."

The subjoined circular has been addressed to county surveyors in England, and to certain of those officials in Wales; also to most of the county and metropolitan boroughs:

ROAD IMPROVEMENT WORK FOR MILITARY PURPOSES

"Sir,—I am directed by the Road Board to submit a request for some assistance towards providing men required for some rather urgent road work.

"The board are engaged in arranging with various highway authorities for road work required in connection with military traffic, and, owing to shortage of labour, progress is slower than it ought to be.

"It has occurred to them that there are many districts in which men are employed upon works which, although of some importance, are not so urgent as the other works to which I have referred.

"Accordingly I am directed to ask your council whether they would agree to assist the road work for the military authorities by placing at the board's disposal, for temporary service in the southern and eastern counties, good workmen who are now in their employment.

"Such men would be well paid for their services (about 6d. per hour), and [illegible] accommodation with blankets and rugs, would be provided free. Railway fares would be paid to the scene of operations, and also return fares to those who return to their present employment.

"It would be convenient if such men as you were able to send were accompanied by a foreman, under whose directions they would work, and, as far as practicable, arrangements would be made for gangs so formed to be employed and housed together.

"The board will be glad if you will kindly deal with this request immediately, and advise me, on or before the 20th inst., how many men your council can spare for the work mentioned. I am, Sir, your obedient servant,

"H. P. Maybury."

In answer to a question why the steam roller had been idle, the surveyor to the Eastbourne Rural District Council, Mr. C. M. Carter, stated that the driver had been ill and he had been unable to get another. He was open to pay 10s. a day. He could get one. He asked a tradesman if he could send a driver, and the tradesman replied that he had only got one man to two engines.

Waterproofing of Flat Roofs.—There [illegible] many [illegible] flat roofs [illegible] and many of these are made watertight with a rendering of Pudlo and cement. A large flat erected at Blackpool (Shaw's depository) was finished about [illegible] months ago, and we understand that both contractor and architect consider the Pudlo treatment a great success.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, A.M.I.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

460. Sewage Sea Outfall. [illegible] pipes better than [illegible] pipes? [illegible] sewage outfall into the sea which is covered at high water. Can [illegible] regard [illegible] expense and [illegible] (J. R. H. *Ipswich.*)

463. Bomb-proof Dug-out. [illegible] bomb-proof dug-out to hold five people. (E. [illegible])

465. Girder Design. What are the main points to be borne in mind when determining the [illegible] purpose of [illegible] type of girder, the proportions of girder (depth and width, &c.), (c) material to be employed (steel, wrought iron or [illegible]? (M. T. R. *Rhyl.*)

466. Road Making. [illegible] road will enable an engineer to [illegible] the builder and [illegible] a [illegible] macadam road. (*Essex.*)

467. Destructors Forced Draught.—Discuss the [illegible] forced blast in destructors. (*Essex.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

464. Masonry Arch. State [illegible] masonry arch may fail, and describe [illegible] (J. H. *Barbados.*)

A masonry arch may fail in [illegible] the [illegible] through the crushing of the [illegible] stress in any section of the arch ring exceeds the crushing strength of the material. The thrust in an arch is a maximum when the arch is fully loaded over the whole span, and the thrust is a minimum when the [illegible] the arch ring. The danger of failure through crushing can be obviated by adjusting the depth of the arch ring [illegible] that the sectional area of all portions of the latter is proportional to the thrust, and so [illegible] that the safe compressive stress of the masonry is not exceeded. Arches of small span are seldom designed from first principles, since they are repetitions of examples of well-established proportions, the arch thickness being determined from empirical rules. They often have a large margin of safety, and are of uniform depth throughout. Arches of larger span (80 ft. and upwards) are designed more in accordance with economic principles, the depth of the arch ring varying from a maximum at the springings to a minimum at the crown. A large factor of safety is necessary when determining the safe compression, in order to provide for variations in the strength of the material as well as for other contingencies. The factor of safety should not be less than eight, according to Rankine. The great weight of masonry required in comparison with the safe compressive stress employed in design, and the heavy centering that must be provided when dealing with arches of large dimensions, limits the useful span to 300 ft., or thereabouts. Examples: Pont Adolphe at Luxembourg, span 277 ft. 9 in. Rise 101 ft. 6 in. Thickness at crown: 4 ft. 8½ in., maximum thickness: 7 ft. 10 in. Grosvenor Bridge, Chester: Span 200 ft. Rise 42 ft. Thickness at crown: 4 ft.; thickness at springings, 6 ft. Second: By shearing of the masonry. As in beams and girders when the arch carries its full load, particularly if the arch be flat, the shear stress at the springings may exceed the shear strength of the masonry. The arch ring must [illegible] stress induced under full load is not greater than the safe shear for the masonry. Third: By rotation. [illegible] is carried out on the principle that no tension should occur in any part of the arch ring under any probable loads that the arch may be expected to take. This condition is fulfilled if the "curve [illegible] sometimes named, lies within the middle third of the arch thickness under any probable loading. When testing the liability of failure by rotation it is advisable to draw the "curve of least resistance" for the arch when the dead load is assumed to [illegible] carrying the live load in addition. Should the "linear arch" or "curve of least resistance" lie within the middle third under this loading, we know that no tension exists in any portion of the arch ring. Should the "curve of least resistance" deviate from the prescribed limits, then the thickness of the arch ring must be modified in such a way that the condition enunciated previously is fulfilled at all points. In discussing the above types of failure, we have assumed that the abutments are unyielding. Should this not be the case the arch cannot fulfil the function of an arch, but is in reality a curved beam; bending stresses would be induced, and failure might possibly occur under dead load only. (M. T. R., *Rhyl.*)

The three most important ways in which a masonry arch may fail are as follows: (1) By the crushing of the voussoirs; (2) by the sliding of the voussoirs one over the other; (3) by the rotation or tilting of the voussoirs. The first of the above is caused when the compressive stress due to the load exceeds the safe compressive stress for the material of which the arch is composed, and is avoided by making the sectional area or depth of the voussoirs [illegible] $= \frac{T}{f}$ [illegible] stress, where T is the thrust on any joint per unit width and d is the depth of the voussoir. The second method of failure is caused by the resultant line of thrust making too great an angle with the normal to the joint, and is obviated by so arranging the joints that the resultant line of thrust at any point does not make an angle with the normal to the joint greater than the friction angle.

The last-mentioned method of failure can only occur when the resultant line of thrust passes outside the section altogether. If this is the case, tilting of the voussoirs will ensue until the resultant line of thrust passes through the pivoting points. Arches cannot fail from this cause if designed in such a manner that their resultant line of thrust lies within the limits of the middle third throughout [illegible] (E. K. *Newport, M.*)

The successful design of a masonry arch is based [illegible] By Crushing: If the arch is too flat for the load and size of ring stones, the thrust in the arch may be too great for the material; thus the pressure intensity must at no point exceed that which is safe for the material. [illegible] By Sliding or Shearing. The [illegible] must be within the limiting angle of resistance to [illegible] By Overturning. At any point of section the resultant thrust from left to right, or *vice versâ*, can be represented in magnitude, direction and position by some line. If we join up by a curve all points in the various sections from abutment to abutment, where such lines intersect the sections, we obtain the "line of resistance." If this line passes through the middle of the section [illegible] passes too near the top we get excessive compression at the top of the joint and a tendency to open at

the bottom. Failure in this manner [illegible] overturning. In rectangular sections, if the resultant zero is one-sixth the width of section from the centre then there [illegible] and double the mean stress at the other edge of section; if we can be sure of only that the resultant is in the middle third [illegible] the edge at that section. It follows that, if we cannot rely on the material standing tension, we should be able to draw the line of resistance entirely within the middle third. [illegible] E. M. *Framlingham.*

NOTES.

The following printer's errors occur in the reply to Question 461 published in the issue of March 6th:—

Example No. 1, p. 359, line 5, should read

(Moment of inertia about axis XX of strip parallel to XX passing through A. Product of area of strip and the centre of gravity of strip from axis XX.

Example No. 1, p. 359, line 12, should read

∴ Moment of inertia of [illegible]

BUSINESS ANNOUNCEMENTS.

At the request of Messrs. F. Hill and G. Hodge, the partnership lately existing between themselves and W. Manders, trading as W. Manders & Co., of Leyton, has been dissolved by mutual consent, and in future the business will be carried on by the contracting world, Messrs. Hill and Hodge are commencing business as public works contractors under the style of The Municipal Contracting and Engineering Company. Since the early part of 1912 they have tendered for and carried out the whole of the contracts obtained by Manders & Co., Mr. Manders having been absent in Canada.

We are informed that the (U.K.) Winget Concrete Machine Company, Limited, have decided to shorten the name of the company to Winget, Limited, and that they have taken new [illegible] London offices at 25 Victoria-street, Westminster, S.W. The head office [illegible] Newcastle-on-Tyne.

Tanks, Cylinders and Cisterns.—W. P. Butterfield, Limited, Shipley, Yorks, announce that, owing to the cost of raw material and labour, all their lists and discounts are withdrawn.

THE WAR AND THE ROADS.

LORD KITCHENER'S REPLY TO RURAL COUNCIL.

The Faversham Rural District Council have been making representations to the War Office in respect of damage caused to roads in the district owing to the consignment on the extraordinary traffic for military purposes.

An engineering expert [illegible] to inspect the roads affected, and it appears that the War Secretary does not appear [illegible] damage caused by such traffic. [illegible] the Council [illegible] the local authorities should [illegible] from patriotic motives and [illegible] fact that a district council [illegible]

Sidmouth Town Planning.—It is understood that the Local Government Board have approved for the preparation of a town planning scheme under the Housing and Town Planning Act, 1909, by the Urban District Council. [illegible] the area affected [illegible]

Maldens and Coombe Sewage Works Extensions.—At the last meeting of the Maldens and Coombe Urban District Council, Mr. E. Lovell, the surveyor, reported that the extensions to the sewage disposal works had been completed, the total cost, after allowing for clinker, cartage of clinker, and sprinklers, being £364 below the contract sum of £1,124. Deducting £364 from £1,151 had left a balance in the hands of the contractors of £787, which had been paid to them, leaving a net saving of £23. The committee considered that was very satisfactory, and congratulated the surveyor on having the work completed [illegible] was agreed that arrangements should be made for a formal opening of the extension works at an early date.

CORRESPONDENCE.

WIND PRESSURE.

To the Editor of THE SURVEYOR.

Sir,—The article [illegible] "Some Notes on Wind Pressure," by Mr. Graham Keevil, which you publish in your issue of the 12th inst., reminds me of an experience of mine when borough engineer of Penzance [illegible] A section of the [illegible] force, but only about 100 yds. in width, swept down [illegible] amount of damage, especially in one of the public parks. A solid monolith granite obelisk was turned over on its base, and fell to the ground uninjured. It was an easy calculation to make as to what force had been applied to effect this reversal, and if my [illegible] to effect this amounted to the very large amount of 90 lb. on the square foot. This, of course, is, fortunately, very exceptional in this country, but I give it as an instance of how the wind can sometimes not [illegible] Yours &c.,

H. [illegible]

7, [illegible] S.W.

Road Improvement in Armagh.—The county surveyor of Armagh, Mr. R. H. Dobbs, in his report after alluding to the condition of the roads in the Armagh and Lurgan rural districts proceeded to point out that there are three ways by which additional material might be [illegible] any increase in local taxation, namely, by obtaining grants from the Road Board, by borrowing money, or by taking a percentage of the [illegible] and by increasing the efficiency of the [illegible] Road Board were prepared to approve of any well-considered proposals for the improvement of the leading roads (not necessarily trunk roads) of the county, and when it was so evident that, owing to the [illegible] these roads could not be maintained in a satisfactory condition at present cost he did not understand why the district councils did not [illegible] the largest possible grants from the Board. He suggested the appointment of a committee to meet at works to be [illegible] Road Board works which they were in progress during the summer.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Colwyn Bay U.D.C. (March 4th. Mr. F. G. Stanford).—£25,000 for the erection of a destructor and an electric generating station. The engineer, Mr. William Jones, explained the object of the application with respect to the destructor, and as regards the proposed loan for generating plant it was explained that [illegible] being run with absolutely no [illegible] plant.

Doncaster R.D.C. (March 4th. Mr. P. M. Crawthorn).—£2,000 for the purpose of [illegible] the construction of Victoria Dock. Mr. F. W. Marshall explained that the [illegible] and £50 was [illegible] 3,140. It was estimated that the ultimate population of the parish would be [illegible] and 20 gallons per head a daily supply [illegible] required. It was proposed [illegible] hall [illegible] (Limited).

Dungannon U.D.C. and R.D.C. (March 2nd. Mr. P. C. Cowan). [illegible] by the urban and rural [illegible] Order empowering [illegible] for the purpose of improving the water supply to the Dungannon and [illegible] works. The [illegible] to be £19,000, [illegible] passed and [illegible] supply and £2,000 [illegible]

Plymouth T.C. [illegible] by the Devonport [illegible] meeting. It was explained that the [illegible] corporation asked that the applications should not be refused, but that [illegible] to the Local Government Board, [illegible] deprived of the [illegible] which they [illegible] troops, guns, and munitions of war, it was extremely important that the Devonport roads should be wide and sound. The majority of the applications relating to thoroughfares in Devonport [illegible] of the road leading to Naval [illegible] The borough surveyor, Mr. J. Paton, said that buildings were in course of erection and would probably be completed within nine months' time.

Rotherham R.D.C. (March 5th. Mr. P. M. Crawthorn).—£492 for water [illegible] Wickersley. Evidence was given by Mr. B. Hey, the clerk, Mr. J. H. Pickford, and others. The council were [illegible] felt it imperative to construct the sewer before receiving the sanction of the Local Government Board, because the health of the children attending the school was likely to be endangered, and the conditions were becoming so bad that it was absolutely necessary to proceed with the work.

Settle R.D.C. (March 4th. Mr. A. W. Brightmore).—£3,000 for a [illegible] water supply to [illegible] cost, of £2,150. [illegible] constructed, and there have been several extensions of mains recently [illegible] ment of the new Ingleton Colliery and the erection of a model village [illegible] increased supply, and [illegible] make provision for Chapel-le-Dale.

APPLICATIONS FOR LOANS.

Ashton-under-Lyne T.C. £293 for [illegible] improvement.

Bexley U.D.C. £[illegible] for the East Wickham sewerage scheme.

Billericay R.D.C.—£800 for sewerage works at Hutton.

Cannock U.D.C.—£10,675 for the erection of forty-four houses.

Chesterton R.D.C. £[illegible] for road purposes.

Dorset C.C. £900 for the erection of two cottages at Buckland Newton.

Haywards Heath U.D.C. £250 for [illegible] road.

Kingston-on-Thames T.C. £[illegible] [illegible] roller-skating.

Reading T.C.—£2,415 for street widenings.

Richmond (Surrey) T.C.—£977 for widening and [illegible]

St. Germans R.D.C.—£200, additional loan for the St. Germans Village water supply.

Seaford U.D.C.—£800 for the drainage of the Northern camp.

Widnes T.C. [illegible] purposes of a [illegible] torium.

LOANS SANCTIONED.

Barnes U.D.C.—£2,900 for the High-street improvement.

Hexham R.D.C. £500 for works of water supply.

Heywood R.D.C. [illegible] for waterworks [illegible]

Penzance T.C. £600 for converting part of the [illegible]

Sheffield T.C. £21,680 for the erection of baths at Hillsbrough and Wincobank, washhouses at Danielhall, and a central laundry near Penistone-road.

Torquay T.C. [illegible]

FORTHCOMING INQUIRIES.

APRIL

13. **Southend** (Mr. George L. Pepler) ... —

Strike of Dundee Street Cleaners. The outdoor staff of the Dundee cleansing department have struck for higher wages, and the streets are beginning to have a neglected and untidy appearance. On Monday four of the foremen, escorted by a strong force of police, [illegible] thoroughfares of the latter which had accumulated for several days. Meanwhile the domestic refuse remains uncollected.

Ballymena Rural Council and their Engineer.—[illegible] to the engineer of the [illegible] respectable instance of [illegible] The road council are [illegible] It [illegible] Mr. Getty, [illegible] reasonably as [illegible] the performance of the [illegible] and in the event of the [illegible] entered into him by the contract. A [illegible] expected the pipe along the pipe line, and made a report "that they were unanimously [illegible] which was at a deadlock, [illegible] amazing report was adopted [illegible] to the contractor [illegible] at once." The [illegible] proceed not merely to [illegible] but to [illegible] and pass [illegible] and severely condemned.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Ilford £6,000, Ossett £10,000; housing and town planning—Walsall; roads and materials—Fraserburgh, Islington, Lichfield; sewerage and sewage disposal Bexley, Redruth; water, gas and electricity—Fifeshire, Poole, Windsor; miscellaneous—Bolsover. Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Aberdeenshire C.C. Failing a grant from the Road Board for the purpose, the County Road Board recommend the county council to give consent to the Alford District Committee to proceed with the erection of a bridge at Drumallochie, at an estimated cost of £1,675.

Gravesend T.C.—The question is under consideration of building an additional isolation hospital.

Grimsby T.C.—An estimate of £300 has been passed for a five-stall extension of the municipal stables and the provision of a harness-room.

Hants C.C.—The Public Health Committee have been authorised to prepare plans for the provision of a combined sanatorium and hospital.

Ilford U.D.C.—A central library is to be built in Oakfield-road, at an estimated cost of £6,000.

Leyburn R.D.C.—The council are considering the question of building an isolation hospital.

Long Eaton U.D.C.—The council have approved plans for an open-air swimming bath to be constructed in West Park, at an estimated cost of £1,750.

Lowestoft T.C.—In accordance with the amended scheme of sea defence prepared by the borough surveyor, Mr. G. W. Hamby, the council have decided to carry out the following works—viz.: North Beach—A Groyne (sixteen bays), £1,540; B Groyne (ten bays), £912; total £2,452. South Beach—A Groyne (eleven bays), £951; Spur Groyne to do (twelve bays), £675; E Groyne (four bays), £242; G Groyne (three bays), £187; J Groyne (three bays), £214; M Groyne (ten bays), £573; South Pier Spur Groyne (twenty-nine bays), £2,063; total £4,905.

Ossett T.C.—A scheme has been approved for the erection of a new school at Gawthorpe, at an estimated cost of £10,000.

Sheffield T.C.—The Local Government Board have given consent to the corporation proposal to erect shops in connection with the new offices of the Electric Light Department in Bow-street, and the committee recommend the council to make application to the Local Government Board for their formal approval to the land being used for the purpose named.

Shropshire C.C. Sites are to be purchased at Hadley and Shrewsbury for an isolation hospital.

Wimbledon T.C.—The borough engineer, Mr. C. H. Cooper, has received instructions to prepare an estimate for the provision of accommodation for the hospital staff.

HOUSING AND TOWN PLANNING.

Altrincham U.D.C.—Negotiations are proceeding for the purchase of 10 acres for the purposes of a housing scheme.

Barry U.D.C.—The Housing and Town Planning Committee have been instructed to consider the question of building more working-class houses.

Lichfield T.C.—Plans for twenty working-class houses have been forwarded to the Local Government Board for approval.

Walsall T.C.—The Health Committee have been asked to submit a report upon the provision of working-class dwellings.

REFUSE COLLECTION AND DISPOSAL.

Bettws-y-Coed U.D.C.—The surveyor, Mr. W. O. Hughes, has received instructions to prepare an estimate of a direct system of house refuse removal.

Isle of Thanet R.D.C.—The sanitary inspector, Mr. Connor, has prepared a new scheme for the scavenging of Birchington and Westgate-on-Sea.

Sheffield T.C.—The efficiency of the cleansing department is threatened owing to the enlistment of employees, 131 having joined to date. Hence the decision that no allowance shall be granted in respect of men engaged in the work of refuse disposal who enlist in future without the consent of the Cleansing Sub-Committee.

ROADS AND MATERIALS.

Aldershot U.D.C.—The Highways Committee, in presenting their estimate for the half-year, reported that they considered it advisable to use granite on the roads instead of gravel. Included in the requisitions was an estimate by the surveyor, Mr. F. C. Uren, for a machine for drying roads before the application of Tarmac.—It was decided to effect an improvement in Newport-road at an estimated cost of £700.

Carlisle T.C.—The Health Committee last week considered the Road Board's reply to their application in connection with the scheme for the improvement of practically all the main roads in the city, at an estimated cost of £15,000. The board stated that they were not prepared to consider the proposals, except in the event of urgent need arising owing to unemployment. It was stated by the mayor, Mr. F. P. Dixon, that there was practically no unemployment in the city, and the scheme was remitted to the Works Committee.

Colchester T.C. The council have resolved to comply with the request of the military authorities, conveyed through the Road Board, to carry out improvement works on the track leading from Layer-road to Reed Hall, and on a portion of the occupation road on Severalls Asylum ground, and the borough surveyor, Mr. H. Collins, has received instructions to invite tenders for the work subject to the Road Board approving the estimate.

Epsom U.D.C.—Draft estimates for road repairs at an estimated cost of £1,837 have been approved by the council.

Farnborough U.D.C.—Tar-spraying is to be carried out on a number of roads during the summer at an estimated cost of £350.

Finsbury T.C.—In connection with the proposal to repave portions of the carriageway of Northampton-square, a letter has been received from the Roadamant Company, Limited, by whom the paving with roadamant of certain sections of the carriageway, of an area of 592 sup. yds., was completed in May, 1912, and is still being maintained free of charge, suggesting that the necessity for their frequent repair arises from water getting under the material, and that the consequent inconvenience both to the council and themselves would be obviated if the area of the paving were extended. They offered to take up and relay, free of charge, the whole of the existing roadamant paving, and at 5s. 2d. per yard super. to pave with roadamant on the foundation to be prepared by the council the area (approximately 708 super. yds.). The council have agreed that the area should be repaved, the old portion as relaid to be maintained by the company free of cost until May, 1917, and the new work likewise maintained for five years from the date of its completion.

Fraserburgh T.C.—Negotiations are proceeding for the construction of an esplanade at the beach at an estimated cost of £10,355.

Harrogate T.C.—Akonia is again to be used for dust prevention this season at Harrogate.

Ilfracombe U.D.C.—The Local Government Board, in reference to the application for a loan of £630 for the High-street improvement, has written that the present time is not opportune for granting additional loans, and they did not think they could properly sanction a loan now.

Ipswich T.C.—Repairs are to be carried out in Carr-street at an estimated cost of £200.

Islington B.C.—An estimate of £26,942 has been agreed to for repaving the whole of Liverpool-road with granite setts and application is to be made to the London County Council for sanction to borrow that amount, less the amount of their contribution.

Lichfield T.C.—Strengthening and resurfacing works are to be carried out in Tamworth-road at an estimated cost of £1,516.

Marylebone B.C. It has been agreed that wood paving, in substitution for granite pitching, should be laid in the portions of the carriageways of Richmond street and Salisbury street in front of Richmond street school's, at a cost of £290. The tender of the Trinidad Lake Asphalt Paving Company, Limited, has been accepted for laying bituminous paving in the carriageway of Grove-road (from railway bridge to St. John's Wood-road) at the price of 11s. 10d. per square yard to include free maintenance for a period of eight years, and the maintenance for a further two years at the rate of 9d. per square yard per annum.

Reading T.C.—The tender of Messrs. Frank Hare & Brothers, at £1,531, has been accepted for private street improvement in Warren-road, and the borough surveyor, Mr. J. Bowen, has received instructions to submit plans, sections, and estimate of the cost of making up Allcroft road a private street.—A number of sites in Basingstoke-road, Lower Thorn-street, and Butter Market are to be purchased for the purpose of street widenings.

Richmond (Surrey) T.C.—The tenders of Messrs. E. Parry & Co., of Putney, at £305 and £182 respectively, have been accepted for making up Nightingale road and part of Chilton road.

Rugby R.D.C. The council have adopted a recommendation of the Highway Committee that in view of the increased price of stone instead of purchasing 3,000 tons of stone of a superior quality for use on the roads having the heaviest traffic, 1,000 tons only of best stone be purchased from the Mountsorrel Granite Company, leaving a balance, as estimated by the surveyor, of 6,000 tons of stone of a cheaper quality and 1,200 tons of chippings and binding, for which the council have accepted the tender of Messrs. Judkins. This was an increase on previous years, but the surveyor was unable to recommend any reduction.—For carting the stone the committee recommended the acceptance of tenders, which, in a number of instances, varied from 1d. to 2d. per ton increase on last year's prices.

Salford T.C.—The Improvements Committee, accompanied by the borough engineer, Mr. Ernest B. Martin, has been engaged recently in visiting sites in Regent-road, Charles-street, and Whit-lane, with a view to effecting prospective road widenings and improvement.

Salisbury T.C.—The city surveyor, Mr. W. J. Goodwin, has received instructions to prepare a scheme for widening Castle-road to 50 ft.

Sheffield T.C.—Official sanction has been given for the corporation to amend the Act of 1890 so as to allow them to contribute towards private street works.

Wandsworth B.C. An arrangement has been reached between the borough council and the county council with regard to the widening of High-street, Wandsworth. The road is to be widened to 60 ft., and a strip of the town hall site, varying from 15 ft. 5 in. to 5 ft. 1 in., will be required.

Whitby R.D.C.—The surveyor, Mr. J. Emerson, has prepared a scheme for the better organisation of labour, and the working of the quarries under his control, involving a considerable saving annually.

SEWERAGE AND SEWAGE DISPOSAL.

Bexley U.D.C.—Messrs. Strachan & Weekes' estimate of £1,685 for the sewerage of that portion of the low-lying area of the East Wickham Ward to the north-east of Edison-road included 15 per cent for engineering and contingencies, and £180 for the extension of the sewer to take in property at Hills Grove. The council have decided to accept Messrs. Strachan & Weekes' terms for supervision of the work, and to make application to the Local Government Board for sanction for a loan.

Birstall U.D.C.—It was reported to the council recently that good progress was being made in the conversion of old privies to the water-carriage system.

Farnborough U.D.C.—The surveyor, Mr. J. E. Hargreaves, has received instructions to carry out sewerage works in Fimgrove-road and a portion of Hillfield-road.

Redruth R.D.C.—The council have adopted a resolution expressing willingness to join the Redruth Urban Council in the construction of a tunnel for the carriage of the sewerage of Illogan and Redruth to the sea, the cost of the tunnel to be apportioned between the respective councils.

WATER, GAS, AND ELECTRICITY.

Atcham R.D.C. The surveyor, Mr. H. Asbee, has [illegible] to prepare a scheme for the [illegible] to supply the parish of Cressage with water from the Local Government Board reservoir.

Fifeshire C.C.—With regard to schemes under consideration for improving the water supply of Upper and Lower Largo, the St. Andrews District Committee have resolved not to carry out any of these in the meantime, but it was agreed to raise the sill of the present reservoir 1 ft., which will provide nearly 1,000,000 gallons extra at the cost of a few pounds.

Holywell R.D.C.—With reference to the proposed water supply for Llanasa the Local Government Board have written requiring the substitution of larger pipes, the provision of certain standpipes, and a supply by gravitation for Ffynnongroew.

King's Lynn T.C.—A Weir pump is to be obtained for boiler-feed purposes at the pumping station, and the provision of superheaters in connection with the boilers at the electricity works is under consideration.

Poole T.C.—A committee has been appointed to inspect typical installations of water-softening systems with a view to the adoption of a scheme by the council.

Portrush U.D.C.—The council have adopted the plans of the surveyor, Mr. Albert J. Clarke, for the provision of water mains in the extended urban area, at an estimated cost of £496.

Windsor T.C.—Tenders are invited for a scheme for [illegible] filters.

MISCELLANEOUS.

Bolsover U.D.C. It has been decided to purchase new appliances and equipment for the fire brigade, and to erect a building in which to store them.

Cockermouth U.D.C.—A burial ground is to be laid out at an estimated cost of £1,000.

Swansea T.C.—With regard to the question of the reorganisation of his staff, in view of the extension of the borough, the borough surveyor, Mr. J. R. Heath, recently submitted to the Highways Committee a report in which he paid a warm tribute to the seniors and juniors for the way they had worked in the preparatory work for the extension inquiry. They worked every day, Saturdays and Sundays included, and very often till 11 p.m., and sometimes later. The typists particularly worked, very frequently, from 9.30 till after midnight. On the chairman's suggestion, applications for increases of salary were referred to the surveyor for report.

FOR OTHER ADVERTISEMENTS
See End of Paper.

CHERTSEY RURAL DISTRICT COUNCIL.

BYFLEET AND PYRFORD SEWERAGE.

ADDITIONAL PUMPING MACHINERY AND ENGINE-HOUSE.

The above Council invite Tenders for the Erection of an additional Engine-house, Gas Generating-house, new Workshop and Coal Store adjoining the present pumping station, Byfleet Village, together with Engine Beds, and other building works in connection with the above.

Plans, specifications, and full particulars may be seen by appointment at the office of Mr. Charles Muggleton, Byfleet Corner, West Byfleet, on or after the 29th inst. Sealed Tenders, endorsed "Additional Engine-house, &c., Byfleet Tender," to be delivered to H. E. Paine, Esq., clerk to the Council, 80 Guildford-street, Chertsey, before 6 p.m. on Monday, April 22nd.

The Council do not bind themselves to accept the lowest or any Tender.

HERBERT BEENEY,
Engineer and Surveyor to the Council.

West Byfleet,
March 16, 1915. (2,493)

COUNTY BOROUGH OF HUDDERSFIELD
TO TIMBER MERCHANTS AND OTHERS.

The Corporation of Huddersfield invite Tenders for the Supply and Delivery of (approximately) 490,000 Creosoted Baltic Redwood Blocks, size 9 in. by 3 in. by 5 in. deep.

The successful tenderer will be required to execute a Contract, the draft of which may be inspected at the Town Clerk's Office, Town Hall, between 10 and 4 o'clock.

Specifications and Forms of Tender may be obtained on application at the Offices of Mr. K. F. Campbell, M.INST.C.E., Borough Engineer and Surveyor, 1 Peel-street.

Sealed Tenders, endorsed "Tender for Redwood Blocks," signed in the handwriting of the Tenderer, or his Agent, and addressed "Town Clerk, Town Hall, Huddersfield," must reach him not later than 10 a.m. on Wednesday, the 7th day of April, 1915.

The Corporation do not bind themselves to accept the lowest or any Tender.

J. HENRY FIELD,
Town Clerk.

Town Hall, Huddersfield.
March 18, 1915. (2,490)

THAME URBAN DISTRICT COUNCIL.
TENDERS FOR MATERIALS.

The Council of the above District invite Tenders for the Supply of Broken Granite and Iron Slag for the year ending March, 1916.

Particulars and Forms of Tender may be obtained on application to Mr. James T. Robinson, Surveyor, at his Office, Town Hall, Thame, to whom Samples of the Materials tendered for must be sent not later than Monday, March 29th, 1915.

Sealed Tenders must be sent to me not later than Monday, March 29th, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

CHARLES SIMMONS,
Clerk to the Council.

2 High-street,
Thame.
March 15, 1915. (2,491)

CHERTSEY RURAL DISTRICT COUNCIL, SURREY.
APPOINTMENT OF TEMPORARY SURVEYOR.

The above-named Council invite applications for the post of Temporary Surveyor, their permanent Surveyor having joined H.M. Forces for the period of the War.

Candidates must have a good practical knowledge of road making, and be competent to keep the necessary wages books and accounts, and prepare plans and estimates; must be efficient in duties appertaining to the carrying into effect of Building By-laws in reference to buildings in the District; must understand making up of Streets under the Private Street Works Act, and the making of apportionments thereunder; must understand the laying of Sewers and connections therewith; must undertake such other work or other employment as may be given at the Council. Preference will be given to candidates able to take up duties at an early date.

An Office will be provided at Byfleet, and candidates must be prepared to reside in that parish. The candidate appointed must have a cycle and must provide and maintain his own cycle.

Salary £2 per week. Engagement subject to one month's notice to determine on either side.

Area of District (including large area of Common), 16,020 acres; population 1911, 9,383.

Applications, in candidate's own handwriting, stating when the applicant will be at liberty, and giving [illegible] must be accompanied by two recent testimonials, and must reach me not later than [illegible] the 24th day of March, 1915.

Canvassing, either directly or indirectly, will disqualify.

Selected candidates will be notified when and where to attend.

L. PORTER,
Assistant Clerk to the Council.

80 Guildford-road,
Chertsey.
March 17, 1915. (2,492)

PERSONAL.

Mr. F. R. Phipps, borough surveyor of Basingstoke, has received an increase of salary.

Mr. R. Cluer, surveyor to the Launceston Rural District council, died recently, we regret to state, aged sixty-eight.

Mr. A. P. Piggott, of the Stoke Newington surveyor's department, has been raised to the rank of staff sergeant.

Mr. Arnold Rudd, of the engineer and surveyor's department, Sunderland Corporation, has joined the Royal Engineers.

Mr. Robert Walton, of the engineer and surveyor's department, Sunderland Corporation, has joined the Royal Engineers.

Mr. J. H. Chubb, surveyor to the East Kerrier Urban District Council, has resigned owing to continued ill-health.

Mr. George S. Barry, a member of the Dundee city surveyor's staff, has been appointed road surveyor to the Deer District Committee, Aberdeenshire.

Mr. A. K. Hawkins, of the Stoke Newington surveyor's department, who has joined the Army, has been promoted to the rank of company sergeant-major.

Mr. Alfred J. Westaway, of the borough surveyor's department, Totnes, has been appointed assistant engineer and surveyor to the Bridgwater Rural District Council.

Mr. A. J. Marshall, borough engineer of Merthyr, has been presented with a clock and vases by the members of the corporation staff on the occasion of his marriage.

Mr. Osborn C. Hills, F.R.I.B.A., district surveyor for the Strand, read a paper, entitled "The London Building Acts, with some Suggested Amendments," at a meeting of the Concrete Institute last night.

Mr. J. L. Peacock, engineer and surveyor of Newtownards, Ireland, has received a Lieutenancy in the Royal Engineers, and has been posted to the 150th Field Company, stationed at Antrim (Ulster Division).

Mr. Thomas Small, burgh surveyor of Cumnock, has been presented by the members of the town council with a barometer and a purse of sovereigns on leaving to take up his duties as burgh surveyor of Dunbar.

Mr. William Dyack, burgh surveyor of Aberdeen, died last week, we deeply regret to state, after a prolonged illness, in the 68th year of his age. Mr. Dyack was born in Ireland and educated partly there and partly in Aberdeen. He entered the office of the late Mr. John Willet, M.INST.C.E., Aberdeen, as an articled pupil in 1873. He served his pupilage there, and afterwards acted as resident engineer for Mr. Willet on the Cruden Bay, Rosehearty, Gardenstown, and Portsoy Harbour works, and on the Nairn and Banff drainage works. He was for two years on the staff of the contractors for the Tay Bridge railway works, and was also for two years on the staff of the engineer-in-chief of the Great North of Scotland Railway, and acted as resident engineer in their Buckie extension railway. Going to Aberdeen in 1884 as assistant burgh surveyor under the late Mr. William Bolton, he was appointed burgh surveyor in 1892. He was a past-president of the Aberdeen Association of Civil Engineers, and a member of the Institution of Civil Engineers and the Institution of Municipal and County Engineers.

In the list of successful candidates at the recent examinations of the Institution of Civil Engineers, out of forty-eight candidates the names are understood the name of only one Indian appears, that of Sayed Ghulam Mustafa, who is an articled pupil with Messrs. Henry Adams & Son, the well-known civil engineers of Queen Victoria-street, London.

Incorporated Sanitary Association of Scotland.—This body will hold its forty-first annual congress at Glasgow from September 1st to 3rd.

Porthcawl Gasworks Purchase.—It was announced at a meeting of the Porthcawl Urban District Council on Tuesday that the award of the engineer, the Hon. John Donaghmore Fitzgerald, K.C., in the matter of the proposed purchase by the council of the Porthcawl Gas Company's undertaking was £30,850. It was stated that this was practically the figure contemplated by the council at the outset of the negotiations.

Some of the Larger Problems of Town Planning.*

By THOMAS H. MAWSON, M.S.A., F.L.I.A.

In undertaking the remodelling or improvement of an existing city, and especially an ancient city, or in the creation of a new one, we have two problems which, in one way at least, are fundamentally different. In the first case we have before us not only so many streets, so many buildings, and so much space with which to deal, but, what is far more important, the individual communal and civic spirit which has, perhaps, been creating and adapting for centuries, and which has made the city what it is socially, politically, morally, educationally and commercially.

In the new city, on the other hand, we are faced with the task of estimating, so far as we can, what form the city's individuality will take, and how far its course of development may be influenced for good, and to what extent the development is beyond our control, and must be met and allowed for in all our operations.

It will thus be seen that, whether the sphere of operations be an old city or a new one, the first essential of the city planner is a thorough study of the origin and growth of cities coupled with that knowledge of men and things and that reverence for the antique which always accompanies it, so that he may be able to read on the face of things as they exist not only the city's history, but the inspiration of the civic spirit and the individuality resulting therefrom.

From the very earliest days—from the days, in fact, in which men first joined forces for defence against mutual foes, whether they be rival tribesmen or the elemental forces—the paramount motive in city building has been strategic, and nothing is written so largely and so plain to see on the fabric of present this strategic element. At every point in their history it has had its influence, and nothing could be more mistaken than to suppose that it is not visible in the new towns which are growing at the present time in our own country, but more particularly in our colonies. The strategic factor is present to-day, for each city seeks a site which will give it strategic advantages in the field of commerce, just as the old city did for the field of battle. The scene has shifted, but it is the same stage and the same drama, shall we say, "localised."

The reason for the earlier inquiry into the origin of the city we are to plan in particular, and of that of all cities in general, hardly needs elaboration or even explanation, for this is obviously the first step in the study in the growth of cities, and, unless our training in this subject is deep and thorough we cannot rightly estimate the lines on which the city we are planning will develop in the future.

Having thus solved the first point in our study through the city's past, and having determined what factors contributed to its planning, we now have to determine how far those conditions still operate and to what extent, and also what other factors have grown up in the city's life, and are likely to grow up in the future, which will modify or change the direction of these influences.

First of all, throughout our investigations we shall find the evolutionary principle at work, and the more we look into the matter the more we shall become convinced that nothing happens in the whole history of a city which has its influence on its growth or decay, which does not partake of the nature of an influence working through evolutionary processes.

If the town planner is to realise the highest and the best that each opportunity affords he must cultivate the broad outlook, and must carry his survey in beyond the confines of the place itself. Wherever the town is placed the designer will always find it necessary to take into consideration many factors which take him far afield beyond the actual scope of his operations.

I think in the few words I have so far said I have clearly indicated the three great rock-bed principles on which all good work by the town planner must rest, and which apply with equal force to every problem he is called upon to solve.

While, however, it would be disastrous for the town planner to approach his task with preconceived ideas as to the direction his improvements should [illegible] preliminary work in first viewing the sphere of his labours and making an itinerary to get the geographical factors fixed in his mind will revolve round these first principles.

I do not mean that the [illegible] planning of a town should fall upon the shoulders of one man. That is [illegible] individual, and no man could possibly be omniscient enough to [illegible] While admitting many notable exceptions, I would [illegible] and as to the cause of the [illegible] villages and [illegible] far has been that it has been placed in the hands of men who have usually been chosen for the task because they have shown considerable ability in one side of the work—such as architecture or administration—and who have been expected to evolve out of their inner consciousness a scheme which shall fulfil the social, practical, or artistic requirements of which his special training has given him no expert knowledge.

How suicidal such a policy is! You will hardly [illegible] I hope that a town plan ought to be the result of the joint efforts of the surveyor, the architect, the sanitary engineer, and the landscape architect, the sociologist, and, in the case of an old town, the antiquarian, never forgetting, of course, the necessity for legal guidance at every stage of progress.

First will come the antiquarian, who will schedule all that through its connection with the history of the town or its intrinsic beauty must be preserved, and who will prepare archæological records, aided by photographs and plans, of all that is old, but which is not important enough to be allowed to stand in the way of that which is modern and hygienic; then will come the surveyor, who will prepare those contour plans on which all subsequent operations will be based; and after him the sanitary and hygienic engineer, who will determine on the source of the water supply, the pressure at which it can be delivered, and consequently the maximum height up the hillsides to which we may build, the position of his sewerage disposal scheme, and consequently the lowest points at which sewers can be connected to it by gravitation, and will also suggest to the sociologist sites which [illegible] public services, such as power stations, gasworks, and the like. With these materials before him, the sociologist will decide the density of the population and the number of houses to the acre which can be allowed over different parts of the site, the educational and recreative facilities to be provided, the location of varying classes of property with a view to [illegible] between the artisan and his work, and, within the limits specified by the engineer, the location of the factory area. Thus is the material produced for the work of the town planner, and it is his province to take all these results of the labours of his confrères in city building and weld them into one co-ordinate and self-contained whole, a whole which shall express efficiency and beauty from every point of view and from every standpoint, whether that of the architect, garden lover, or sociologist, without sacrificing for one moment any of the solid qualities demanded by the practical citizen. This he will do not by the superposition of merely [illegible] but by balancing mass against open space, height against breadth, the open vista against the enclosed colonnade, level masses of subdued and restrained architectural façades against the telling note of the tower with its strongly marked vertical lines, nobly spreading trees against the open glade, bright colours reflected in still water, and so on, all in mass, and with the broad outlook, leaving to the architect and the horticulturist the filling in of details in a manner consonant with his vision of the city to be.

I do not mean you to infer that each of these specialists will take up the work in turn and do his own special task independently of the others. Their spheres will interlock at every point, and if the city planner adequately fills his office he will be in direct communication with them all during the whole pe-

* From a paper read at the last meeting of the Town Planning Institute

cess. He [illegible] calling for infinite patience and unlimited tact, but above and beyond this his training must fit him to be sympathetic with the aim and the point of view of all the others. He must have a knowledge of, or be found in each and will be necessary to him to work, not only that he may the better understand and appreciate the point of view of each specialist, and so by an diligent sympathetic encouragement, but also that he may adequately estimate the [illegible] which each in turn is the contribute which each specialist will make to the whole and practical outcome, the material of attendance, collective material which the various workers will place in his hand. Nor would the group of specialists [illegible] the same for each fresh feature which would call for fresh expert advice.

Thus we have a brief sketch of our task which though necessarily sketchy and imperfect, cannot fail to raise in the mind of any man who is possessed of sufficient practical imagination to put himself in place in the profession, a great and lasting enthusiasm for the practice of city planning.

Let us take the main principles which stand out as what are a few of the most obvious lessons to be drawn from them. The principles are as follows:

That each part of the city plan and each separate feature should be designed with direct regard to its connection with every other part.

That all efforts of town improvement demand that broad outlook which, by co-operation with other arts and sciences, will embrace and correlate factors concerning to all sides of the problem — aesthetic, ethical, economical, commercial, and recreational.

That the principle of the [illegible], with the several concentrated and the [illegible] should receive due recognition.

That only by the broad outlook which comprehends the past and the present and, as far as is necessary possible, the future, and which will grasp and control all the factors which make for the voluntary advance or decay of cities can success be achieved.

From these ethical principles, which ought to be the dominating influence [illegible] our conception of the art and science of town planning, let us now turn to the economic factors which in this materialistic age are not only to be observed, but which, in the vast majority of cases, are primarily operative to the exclusion of all other factors. Our schemes today have to be something more than academic proposals — we have, in short, to prove that what we plan will also pay, either in the shape of interest (in terms of money) on the capital expenditure, as in waterworks, gas and electric and tram undertakings, or in terms of increased mental power, [illegible] adequate educational facilities, or physical efficiency such as we expect to reap from better housing and the provision of park and playground for the community directly affected.

We must never forget, therefore, that the practical man has always at the back of his mind an adequate return on the expenditure and [illegible] right to expect it. I would urge upon every town planner that the only reasonable position we can assume is that an adequate return on municipal expenditure can only be attained by the adoption of town planning methods, and this further fact that, when we have attained perfect efficiency, which is always economic, in any department of our enterprise, we have at least laid the foundation of true beauty, for utility itself is potentially beautiful. On [illegible] park, is only economic in proportion to the number [illegible]

[illegible] compact with its many activities, commercial and [illegible] ducing the wear and tear over main arteries by the reduction of heavy traffic by placing factories and power stations and warehouses in direct connection with railway system, river and sea ports.

[illegible] workpeople in the most perfect manner, and from this a reflex action is now taking place, and the additional profits derived from an economic position, [illegible] model town, [illegible] on its part [illegible] dends under [illegible] to be disposed of [illegible] and [illegible] efficiency.

The circulatory system of arteries and main roads should form the first [illegible] plan and [illegible], to my mind, be first solved diagrammatically, our first care being to secure a scientific and economic [illegible] with [illegible] and avoid [illegible] on [illegible] for every [illegible] in the [illegible] community.

ARTERIAL ROADS IN MIDDLESEX.

PROPOSALS FOR NEW HIGHWAYS.

At the [illegible] meeting of the County Council of Middlesex the principle of the construction of new arterial roads in the county, in accordance with suggestions [illegible] on the map prepared by the county engineer, Mr. H. T. Wakelam, was approved.

Route No. 1 was shown to commence at Hampton Road, at a point on with the main St. Albans road, and the main Great North Road; thence following a route through the northern part of the county, crossing the main Edgware road, and passing between Wembley and Harrow, and on through Perivale, Ealing, Hounslow, Hanworth, and Sunbury to Chertsey Bridge. At the last-mentioned point the road would link up with the proposal of the Traffic Branch of the Board of Trade.

Route No. 2 was shown on the map to cross the county near east to west from a junction with the main Oxford road at a point near Denham, proceeding thence past Harefield-place, Ruislip, Pinner Wood, the Red Hill, Mill Hill, Finchley, Friern Barnet, Southgate, and Edmonton, to link up with the main Colchester road.

Route No. 3 was shown to link up with Route No. 1 at a point near Ruislip, passing thence by way of Ickenham, Greenford, Ealing, and Acton to North Kensington.

The whole scheme [illegible] of a comprehensive character, the length of the three routes being about 55 miles. It was estimated that the total cost of the scheme, so far as Middlesex was affected, would be about £5,000,000 sterling.

The value of the scheme, both from a traffic and [illegible] point of view, would be considerable.

QUERIES AND REPLIES.

[illegible] undertake to reply to any [illegible] communicated by the readers, and address [illegible] required [illegible] [illegible] [illegible]

Vol. XLVII. MARCH 26, 1915. No. 1,210.

Minutes of Proceedings.

River Pollution by Trade Effluents.

The result of the appeal in *West Riding Rivers Board* v. *Loutheon Urban District Council* is hardly calculated to smooth the path of local authorities who have to deal with manufacturers' effluents. It will be remembered that the decision of the Divisional Court now reversed by the Court of Appeal was that proceedings cannot be taken against a local authority under sec. 4 of the Act for causing or permitting polluting liquid proceeding from a factory or manufacturing process to fall into or be carried into a stream, but that any such proceedings must be against the manufacturers. We commented upon that decision in our issue of May 8th last, when we stated that the conclusion of the Court seemed to us not only to be amply warranted by the language of sec. 6, but also to be in accordance with the equities of the matter, especially bearing in mind the obligation put upon the sanitary authority by sec. 7 to afford facilities for the discharge of trade effluents into their sewers. Our readers are of course familiar with the Act, but we may remind them that it is divided into four "Parts," dealing respectively with "Law as to Solid Matters," "Law as to Sewage Pollutions," "Law as to Manufacturing and Mining Pollutions," and "Administration of Law." The Third of these Parts (with which we are more immediately concerned) consists of sections 4, 5 and 6. Sec. 4 is directed against pollution from manufactories, and sec. 5 against pollution from mines. Sec. 6 (which is the important one in this case) provides that proceedings shall not be taken "under this Part of this Act," except by a sanitary authority, nor without the consent of the Local Government Board. In giving or withholding their consent, the Board are to have regard to the industrial interests involved and the circumstances of the locality, and they are not to consent to proceedings by the authority of any district which is the seat of a manufacturing industry, unless satisfied that means for rendering the effluents harmless are reasonably practicable, and that no material injury will be inflicted on such industry. Moreover, the alleged offender is to have an opportunity of being heard before the authority against proceedings being taken, "so far as the same relate to his works or manufacturing processes."

Now, as pointed out by Mr. Justice Bankes in the Divisional Court, this section deals with two classes of persons—viz., the persons *by* whom proceedings are to be taken, and the persons *against* whom proceedings are to be taken. "Person," it is to be remembered, by the definition clause includes any body of persons, whether corporate or unincorporate. The "person" to take proceedings is the "sanitary authority"—*i.e.* (outside the Metropolis), the urban or rural sanitary authority acting in the execution of the Public Health Act, 1875. Obviously they could not take proceedings against themselves, and hence the section is evidently framed upon the assumption that the persons to be proceeded against are the manufacturers. This appears in the principles laid down for the guidance of the board in giving or withholding their consent, in the restriction placed upon their consent, and still more emphatically in the power given to any person to object to proceedings being taken "so far as the same relate to his works or manufacturing processes." But under sec. 14, subsec. (3) of the Local Government Act, 1888, that board were authorised to constitute bodies representing the counties through which a river flows, and to confer upon [illegible] the powers of a sanitary authority under the Act of 1876. The West Riding Rivers Board is a body so constituted, and that board have power to take proceedings under the Act, thus giving rise to a situation which could not have been contemplated at the time when it was passed, and revealing the difficulties in its interpretation which have appeared in the present case.

The Court of Appeal, in differing from the Divisional Court, and holding that a sanitary authority can be proceeded against under sec. 4, based their decision upon sec. 8, which provides that every sanitary authority shall (subject to the restrictions contained in the Act) have power to take proceedings in respect of the pollution of a stream within their district against any other sanitary authority or person, whether the offence is committed within or without the plaintiff authority's district. The words of this section are no doubt wide enough to include proceedings under sec. 4, and the Court thought that no inference to the contrary could be drawn from sec. 6. This decision, it will be noted, merely disposes of the preliminary objection raised by the council that no proceedings could be taken against them. It still remains to be decided whether the alleged offence was in fact committed by them. Presumably it also leaves open the question whether, when trade effluents flow into a stream after passing through a sewer vested in a sanitary authority, that authority can be deemed to "knowingly permit" the effluents to flow, within the meaning of that section. Prior to the passing of the Rivers Pollution Prevention Act, 1893, it was held that no offence was committed by a sanitary authority under sec. 3 merely because sewage was discharged into a stream through a sewer not constructed by but vested in them. It was in consequence of this decision that the Act of 1893 was passed, providing that in such circumstances the

sanitary authority shall for the purposes of sec. 3 be deemed knowingly to permit the sewage to flow. It is significant that there is no similar provision with respect to offences under sec. 4.

* * *

Proposed Civic Surveys.

In November last we called attention to the then newly constituted Professional Classes War Relief Council, which was created for the purpose of attempting to meet the pressing needs of the large numbers of professional men and women whose means of livelihood had been taken from them owing to the outbreak of the war. The council has since its inception done much practical work, and many deserving cases have received assistance; and now in conjunction with other societies a scheme has been produced with a view to meeting the unemployment which is rife in the architectural and surveying professions. Starting with the principle that the best of all ways to assist those who are in need of help is to employ them in work which will be of real service to the community, but which would not in ordinary circumstances be undertaken at the present time, the committee have evolved a scheme for the organisation of a series of civic surveys. These would consist in collecting and recording in an easily accessible manner such data, in respect of the area concerned, as are required in order to attain a complete and comprehensive knowledge of the whole of those interests, upon the preservation or enhancement of which, in their corporate or civic aspect, depend the welfare, in the broadest sense of the word, of the inhabitants. The committee have formulated definite proposals which are embodied in a memorial to the Professional Classes sub-committee of the Government Committee on the Prevention and Relief of Distress, and they ask for a substantial grant from the Prince of Wales's Fund to enable them to initiate the work. It is proposed that those engaged on the work should receive a payment by way of remuneration rather than relief, the average rate suggested being £2 a week, and it is estimated that a sum of about £10,000 would be sufficient to provide employment for about 170 men for a period of six months.

As regards the scope of the proposed surveys, it is suggested that for each area a series of graphic diagrams should be prepared showing for the whole area and for separate districts: (1) Physical characteristics of the area; (2) vital statistics as to death and disease for, say, fifty years; (3) density and growth of population; (4) provision of playing fields, recreation grounds and parks, and centres of recreation; (5) character and growth of industries; (6) extent to which present traffic needs are met, and forecast of probable future requirements; (7) conditions under which housing areas have been developed in the past, and a comparison with newer views in the laying out of building estates. The letter points out that, broadly speaking, there may be said to be two reasons why it is desirable for the inhabitants of any town to have access to an ordered record of their corporate interests: Such a record stimulates the individual citizen to take a wider interest in his city as a whole: and, by directing his attention to those assets in the life of the community, the value of which he may not, owing to his concentration in his own occupation, have had an opportunity in the past of fully appreciating, places him in a better position to form a reasoned and balanced judgment on those occasions when, owing to development in any direction, a readjustment is proposed in any of the existing arrangements of his town. Further, such a record not only enlightens the judgment of the main body of citizens, but also enables their technical advisers who may be charged with the task of elaborating and carrying out improvements in town planning to provide for a just compromise between the various elements, intellectual and material, which may be affected by new arrangements. Having regard both to the undoubted utility of the proposed work, and also to the need for some relief to those who would be employed in it, we cordially hope that the necessary financial assistance will be forthcoming either from the Prince of Wales's Fund or some other source.

* * *

The Remuneration of Architects.

The broad lesson to be drawn from a very able paper on "The Law as to the Remuneration of the Architect," read by Mr. A. Montefiore Brice at the last meeting of the Society of Architects, is that, whenever it is possible to do so, the matter should be the subject of an express contract with the client. This is at once the simplest and surest way to avoid future trouble, and in the absence of such an agreement the right of the architect is limited to the receipt of such remuneration as is reasonable in all the circumstances of the case. The question then generally arises as to whether the scale of charges laid down by the Royal Institute of British Architects is either in itself reasonable, or so well known and recognised as to amount to a custom upon the footing of which the contract must be taken to have been entered into by both parties. To neither of these questions can there be given any definitely affirmative answer applicable to all cases. The safest course for the architect is therefore, as stated by Mr. Brice, expressly to agree with his employer that his payment shall be made upon the basis of the schedule of charges as drawn up by the Royal Institute of British Architects, supplemented, where necessary, by Ryde's scale. Dealing with those charges of an architect which arise directly out of the building contract, Mr. Brice clearly indicated the legal principle underlying the absence of any liability on the part of the building owner to pay for unaccepted competition designs. Such drawings are regarded as mere estimates, and are on the same footing as drawings submitted for approval for which no remuneration is due in the absence of any agreement to the contrary. If, however, such plans are used at all, even if the architect is not engaged to superintend the work, he is entitled to be paid a fair fee for them. In regard to matters outside the building contract—such as the making of surveys, the measurement of completed work, or the preparation of bills of quantities—the architect is, in the absence of an express or implied agreement for a fixed or ascertainable sum, only entitled to charge what is reasonable. It must always be borne in mind, however, that if the architect's work is unskilful, or useless for the purpose for which he was employed, he is not only not entitled to any remuneration, but he may also be liable in an action for negligence.

* * *

Langport Council and their Surveyors.

"Another surveyor resigns" was the heading that caught our eye in a *Somerset County Herald* report of a recent meeting of the Langport Rural District Council. It appeared from the discussion that the assistant surveyor for the Eastern District had resigned, and that it was not so very long since a prior vacancy had occurred from a similar cause. Some of the rural councillors were beginning to be a little concerned about these resignations, and one of their number proposed that the council should go into committee at the close of the meeting and discuss the whole matter, but this was lost. The chairman, Mr. W. Rowe, thereupon told the members he was certain they would never get a surveyor who would stay with them [illegible]

amount they offered. This amount was not stated, but on referring to THE SURVEYOR of January 22nd last we find the Langport Rural District Council were then seeking an assistant surveyor at a salary of £75 per annum. This advertisement had reference doubtless to the other resignation which the reporter had in mind when writing his headline. The Langport Rural District Council, in fact, did not hesitate to offer to a professional man some duties responsible and multifarious enough which a portion of two or three years' experience would consider barely an adequate salary. It is little wonder in such circumstances that, as one councillor put it, "they might as well be without an assistant surveyor, for no sooner had they got a man there and he knew the roads than he was off again." This view seemed to appeal so strongly to the meeting that they passed their present difficulty, and resolved to discuss the matter in committee. What their decision was does not appear. What it ought to have been is too obvious to any fair men who are without bias to need to say.

* *

"The Surveyor" and Exhibitions.

By way of preface to the following paragraph it is desirable to recall here certain data with regard to this journal's successful promotion of exhibitions of road-engineering materials and appliances. We claim to have originated the idea of these specialised shows when in 1897 we filled a single bay at the Agricultural Hall with loan samples of road-making stones. Since this modest attempt we have organised these exhibitions biennially on a gradually growing scale of completeness which of late has necessitated the use of the whole of the extensive gallery of "Olympia." And in connection with these exhibitions we have arranged conferences at which have been discussed by experts the latest phases of roads improvement and administration questions. At the particular conference held under the presidency of Sir James Wolfe Barry, the first effort of the kind was made, with gratifying results, to substitute union for antagonism in the relations of road engineers and road users, a course which was certainly an important factor in paving the way to the creation of the Road Board. THE SURVEYOR, with the invaluable aid of Mr. E. J. Lovegrove and H.M. Geological Museum, was privileged to place for the first time on a scientific, combined with a practical, basis, the classification of road stones; and it was the pioneer of the movement which led to the standardisation of road materials under the auspices of the Institution of Civil Engineers. It might be tedious to amplify a recital of its other activities in connection with "road roads," but those already mentioned may be accepted as proving that we have at least a prescriptive right to form and to express an opinion as to further road making exhibitions now that one is projected.

* *

The C.C.A.'s Exhibition.

Following this preface, therefore, we refer specially to the "National Road Exhibition" which, as will have been gathered from the particulars given in our last issue, the County Councils Association of England and Wales propose to arrange for the end of June next. We cannot help thinking that the most important of the reasons which influenced our 1915 year's decision to defer our own exhibition, in spite of preliminary announcements as to its being held, bear with equal force on the holding at the present time of any other such exhibition. For the conference to be associated with it we have nothing but welcome. Mr. Montague Harris, the secretary of the association, is a born organiser, and in the capable hands of himself and the efficient helpers he has gathered round him it may be taken for granted that such conference will be of the highest interest and utility, and will be admirably arranged and carried through. There are undoubtedly many questions which it can ventilate to national advantage—to wit, as examples, the engineering and financial conditions which have arisen out of the commandeering of motor vehicles by the military authorities; the possible provision of work on roads for the unemployed directly after the war, on the discharges from military service; the possible openings for machines and material for road rebuilding in the France (we hope) and Belgium, France and elsewhere on the Continent, as well as at home. But an exhibition held simultaneously with the conference obviously cannot reflect in practical shape anything new or desirable which manufacturers may be inspired to devise through suggestions evolved at the conference. These must be contrived and shown later. Meanwhile, we opine that an exhibition during this horrid year of carnage is untimely and unnecessary, and we have good reasons for holding that it will not be welcomed by potential exhibitors. Even if the County Councils Association share with Mr. Horatio Bottomley the view that the war will be practically over in June, it must be remembered that exhibitors will be called upon to make up their minds now, and there will be few (if any) among those who are in agreement with such supremely sporting optimism.

* *

The War and Appointments.

In these days of national crisis it is generally admitted that those who are serving their country should not be prejudiced to a greater extent than is absolutely necessary in regard to their professional advancement. In this connection our attention has been called to a possible injustice in the case of those holding appointments on the staffs of local authorities. In almost every instance the question of salary while on service has been dealt with satisfactorily, but a point as to promotion is in serious danger of being overlooked. Obviously, those on active service are precluded from making application for any new appointment while they are so occupied, and to that extent their position will be prejudiced. A suggestion has been made that during the war all such appointments should be filled temporarily, a well-meaning proposal which, however, evidently bristles with difficulties. We observe that at the last meeting of the council of the Institution of Municipal and County Engineers it was resolved to approach the Local Government Board and to ask them if they can see their way to advise all authorities to deal with vacant appointments in this manner as far as possible. We assume that this decision was taken after careful discussion and consideration, and we confess at once that we are at present unable to make any better alternative suggestion. We feel, however, that it may not be possible in the case of some of the more important posts to deal with the matter in this way, and, even if it were, that there would be considerable difficulty in dislodging the temporary occupant of the position. The principle of considering those on service, however, is undoubtedly a sound one, and we hope that in this or some other way it will be applied wherever practicable.

EASTER HOLIDAYS.

Owing to the necessity for going to press earlier than usual, news and advertisement matter intended for insertion in next week's issue of "The Surveyor" must reach us not later than Wednesday morning, March 31st.

School Building in Mining Districts.

GROUND MOVEMENT PROBLEMS.

Special articles in the current issue of *Kahncrete Engineering*, the excellent bi-monthly devoted to reinforced concrete as exemplified by the Kahn system, treat of the problems which present themselves to the architect and the engineer in coal mining districts of the county of Durham. In certain quarters of the county, it would seem, it has become almost impossible to erect brick buildings, subsidences having very frequently broken the back of the walls before the buildings could be occupied.

The first of the accompanying illustrations illustrates some of the effects of earth movement on the Tanfield Lea higher elementary school, where it will be observed that very serious ruptures in the masonry have taken place, indicating a movement which quite conceivably might have had serious consequences. These faults in the building developed before the school was used, and, of course, were very costly to repair.

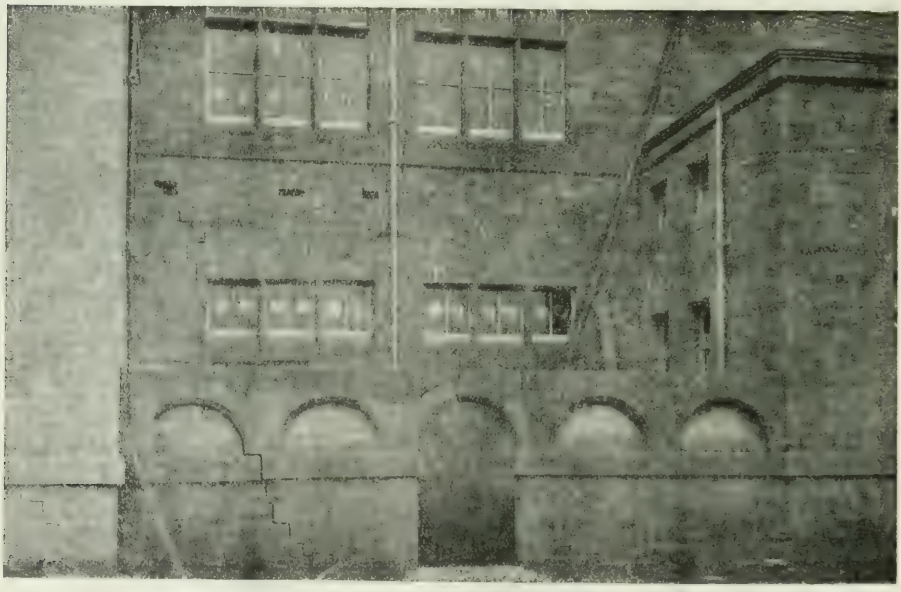
A striking instance of the difficulty of counteracting earth movement was exemplified in the new school constructed for the Education Committee at Sheldon, which was built on a very expensive concrete raft designed to form a basement to the school, and presenting an indeformable box underneath the superstructure. The school had not been open for more than six months when the raft failed, and the brick superstructure became dangerous.

The difficulty in this case was finally overcome by the erection of what is known as the Greencroft school.

It was originally intended to erect this school with bricks on concrete foundations reinforced with steel rails, and plans were prepared and estimates invited. Some doubt was entertained, however, as to the advisability of this method of construction, owing to the fact that the weight might cause surface settlements to occur. An expert mining engineer was consulted, and he recommended some form of construction which should consist of strong framing and a light method of filling in between.

Instructions were given to the architects to prepare a scheme on the lines recommended by the expert. The school was to accommodate 900 scholars in three departments—boys', girls', and infants'—with the usual central halls, cloak-rooms and teachers' rooms, while cookery and manual rooms were to be included in the scheme. The buildings are planned to form a square; the centre of the square forms a sheltered drill yard, and the classrooms are grouped round this quadrangle. Classrooms, &c., are also placed on the outside of the square, being divided from the inner classrooms by a wide top-lighted corridor. The teachers' rooms are on the first floor. The illustration gives a good idea of the general grouping of the building.

Exhaustive inquiries were made into the various forms of construction on the market, such as hollow bricks, slabs, thin bricks with wire reinforcement, various metal lathings, &c., and after going into the merits of each the architects recommended that Hy-Rib form of construction would meet the requirements, owing to its strength, lightness and rigidity. The plans were submitted to the Board of Education, who approved the entire scheme without any amendments, and signified that the school would be considered as a permanent structure, and not of a temporary character.



Detail of Tanfield Lea School, showing Cracks in Masonry.

The vegetable earth was removed, and excavations were made to the stiff clay subsoil for a level foundation. At each point below a stanchion a small block of concrete was placed, and a similar block was placed midway between, so that a deal level was obtained for the foundations of steel girders. Each girder was designed to carry the full weight from stanchion to stanchion, without the intermediate support. Stanchions were then erected at the corners of each classroom, or wherever required; on these stanchions channel-irons were bolted from corner to corner, thus forming a strong framed skeleton structure upon which the usual wood and slated roof was constructed. Intermediate rails were erected to carry flat roofs and corridors.

The filling in to partitions and outside walls was all of the scantlings—viz., 6-in. by 2-in.—these being securely fixed to the foundations, and roof girders were placed about 4 ft. centres, to suit the door and window openings, which are of the usual type. Great care and forethought were exercised to insert grounds for dado and picture rails, cloak rails, bearers for lavatory basins, vents, &c. The economy resulting from these provisions is quite apparent.

The whole outside and inside surfaces were then covered with Hy-Rib, which was easily fixed by the plasterers. The exterior was then coated with cement ½ in. thick, and finished with Derbyshire spar dashed on.

The interior was coated with plaster, and finished smooth, afterwards receiving two coats of washable distemper. Wood dados were placed round all the rooms, particular attention being given to deaden the space between the wood dados. But this precaution would not have been necessary had the walls been plastered to the floor on Hy-Rib.

Owing to the slope of the site it was necessary to form three floor levels. No difficulty was experienced in having the whole of the work erected and finished, including the fixing of Hy-Rib, by local workmen, and the final result was exceedingly satisfactory, and has called forth commendation from many quarters.

STREET CLEANSING IN CANADA.

CALGARY'S MOTOR VEHICLE EQUIPMENT.

The city of Calgary has about 1,300,000 sq. yds. of street pavements covering in the neighbourhood of 54 miles of streets. The equipment for street sprinkling and flushing (states the *Canadian Engineer*) consists of four horse flushers, four rotary brooms, two squeegees, five horse sprinkling tanks, and two 5-ton electric motor trucks.

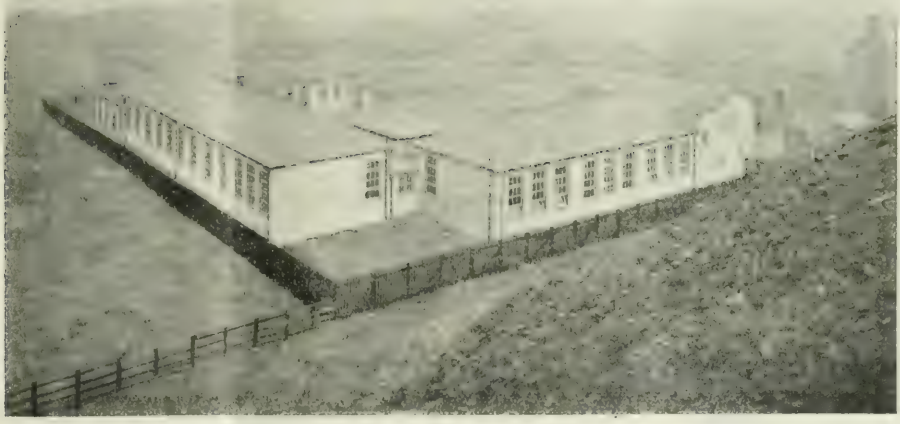
The total motor vehicle equipment consists of eight electric trucks. Besides the two just mentioned, there are two 3-ton trucks for the waterworks and stores department, one 5-ton truck for the sanitary department, and three 1-ton trucks for the electric light and street railway department.

With respect to the electric sprinklers and flushers, it is stated that during the season of 1914 they saved the city nearly £5 a day in the cost of watering streets. They were operated nine hours in the daytime for sprinkling and eight hours at night for flushing. They averaged 38 miles each per day and 17 miles each per night. They used 5s. 6d. worth of electric power per truck during the seventeen hours. In addition to this saving, the other six motor vehicles showed similar economy, and it is the intention of the city to replace horse-drawn equipment with motor trucks for all municipal work.

REFUSE REMOVAL IN THE METROPOLIS.

DIFFICULTIES OF TRANSPORT.

At Wednesday's meeting of Camberwell Borough Council the Works Committee reported the receipt from the town clerk of Bermondsey of a letter stating that, as a result of the Government commandeering barges and railway trucks for the purposes of the war, large accumulations of street refuse 12 ft. in height had been allowed to remain on the contractors' premises. The contractors had failed to succeed to remove the material. Some of the accumulation dates back to November, and possibly earlier, and it was intimated that a similar condition of things existed at the council's wharf, where two barge loads had been lying for months. The letter pointed out danger of this from the public health point of view, especially with the approach of warmer weather, and asked the Camberwell Council to concur with the action taken by the Bermondsey Council in making representations to the Government and to the railway companies requesting, in the interests of the public health, that greater facilities should be afforded for a prompt and effective mean of getting rid of the street and house refuse by releasing sufficient barges and railway trucks for this purpose.



School at Greenroff Built Entirely of Hy-Rib Cement Walls.

The Works Committee also reported that a letter had been received from the town clerk of Islington making a similar complaint of the shortage of trucks and consequent accumulation of large quantities of refuse at the council's depots. Every effort had been made to dispose of the refuse, but without success. While it was recognised that the Government should have a sufficient supply of trucks to enable the war to be successfully prosecuted, it was considered to be vital to the health of the community that the necessary facilities should be given for the prompt removal of the refuse, and representations had been made to the Government accordingly.

A Glossary of Road Terms (By H. Percy Boulnois, M.INST.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

C*

MALDENS AND COOMBE SEWAGE WORKS EXTENSIONS.

For some considerable time, owing to the rapid growth of the population of the district, and to the undertaking generally being out of date, the effluent at the sewage works of the Maldens and Coombe Urban District Council had been unsatisfactory. The council called for a report on the matter, which the engineer and surveyor, Mr. R. H. Jeffes, Assoc.M. Inst.C.E., presented in January, 1909. The proposals made were from various causes not immediately acted upon. Nothing further was done until July, 1910, when, in consequence of complaints from the Thames Conservancy, the council decided to carry out some partial measures to improve the effluent from the works. On the recommendation of the engineer and surveyor, one of the sedimentation tanks was increased in depth to 8 ft., and a new percolating filter, 80 ft. diameter, installed. The new work to the tank was carried out in reinforced concrete, and new channels adjoining the engine-house were constructed, a recording apparatus being also installed. The clinker in three contact beds was washed and renewed, and other improvements made. The whole of the work was carried out departmentally, and cost £1,230, the details being: Sedimentation tank, £191; percolating filter, £585; improvements to contact beds, £454. The works were opened in February, 1911. The beneficial effect of these works was at once apparent, but still further works were felt to be necessary to put the council in an entirely satisfactory position. Accordingly, in February, 1912, a further report was presented to the council by Mr. Jeffes, who recommended additional percolating filters, humus tanks, sedimentation tanks, detritus tanks, and sludge beds. These proposals were, with slight modifications, finally adopted, and the sanction of the Local Government Board was given in due course. The tender of Messrs. J. May & Sons, of Ashtead, was accepted for the sum of £6,124, and a start was made in March, 1914. The works have been well carried out, and a saving of £314 on the above sum has been made. Simplicity has been aimed at throughout, so as to obtain the greatest amount of purification with as small an outlet as possible, and generally the scheme is one which reflects the highest credit on the council's engineer and surveyor, who throughout has been unremitting in his attention to the details of the work.

Sedimentation tanks Nos. 2 and 3 have been completed in a similar manner to Tank No. 1, the walls being raised an additional height of about 4 ft. 2 in. The inlet carrier has been raised, and a new high-level outlet formed. The external walls and the division wall between the two tanks has been strengthened by reinforced concrete, the reinforcement being by means of expanded metal embedded in the concrete. The capacities of the tanks as altered are about 500,000 gallons—equal, approximately, to the present dry-weather flow.

Two detritus tanks of a combined capacity of 29,815 gallons, or about $\frac{1}{17}$th of the dry-weather flow, have also been constructed at the inlet end of tank No. 3, the interception and handling of the sludge having previously been a somewhat difficult and far from economical process.

The division walls between the tanks are of reinforced concrete, 1 ft. 6 in. thick, reinforced by expanded metal on each side. The bottoms of the tanks are formed in the shape of an inverted pyramid, with a small sump. The sludge will be emptied at frequent intervals by means of the hydraulic head of water in the tanks through two 4-in. cast-iron pipes, and pass, by gravitation, to the sludge beds, which comprise an area of about 2,100 sq. yds. The sludge beds are constructed with a layer of coarse clinker, 6 in. deep, followed by a layer of medium clinkers, 3 in. deep, and a top layer of fine clinker or sifted house refuse 3 in. deep. They are under-drained by 4-in. and 6-in. earthenware pipes, and the means is made the supernatant water which gathers over the sludge can be removed.

For additional filtration of the percolating [illegible] revolving sprinklers have been installed [illegible] 80-ft. diameter and of about 4·7 ft. average depth, and a cubic capacity of about 875 yds. The filtering medium consists of well-burnt hard, vitreous clinker of a gauge varying from 3 in. to 1 in., arranged in layers. The new high-level humus tanks, with [illegible] a capacity of 42,806 gallons, or about two hours' dry-weather flow, will afterwards arrest suspended matters in the effluent, which will then be dealt with by the four existing contact filters. Thence the effluent will pass through two low-level humus tanks for the final elimination of suspended matters. The construction of these tanks is identical with that of the high-level humus tanks.

The final effluent now obtained proves the success of the scheme. Messrs. Adams Hydraulics supplied the sprinklers and valves, penstocks and ejectors; the cast-iron pipes were supplied by the Thames Bank Iron Company; the metal for reinforced concrete by the Expanded Metal Company; clinker by the South Metropolitan Gas Company; and the floor tiles by Messrs. Stiff, of Birmingham. Mr. W. B. Buxton acted as clerk of the works, and carried out his duties in a very efficient manner.

The formal opening of the extensions is fixed for to-morrow (Saturday) afternoon.

THE LONDON BUILDING ACTS, WITH SOME SUGGESTED AMENDMENTS.*

By Osborn C. Hills, F.R.I.B.A., M.C.I.,
District Surveyor for the Strand.

This paper is submitted with the view and the hope that a new Act will shortly be prepared embodying the existing laws, by-laws, and regulations. In 1894 our present London Building Act was passed, and thereby cancelled some thirteen existing Acts which had to be read together. Twenty-one years have elapsed since then; many decisions have been given in the High Courts, some of which completely annul the intention of the Act; many amendments have been framed, some of which have become law; and it will soon be necessary to repeat the process of 1894 and pass a new Act embodying all the existing laws and regulations, with certain desired modifications and improvements. Such improvements should be the carefully considered results of the various authorities—the Royal Institute of British Architects, the London Society, the Town Planning Institute, architects, surveyors, structural engineers, builders, and property owners should now unite in preparing such improvements in the Acts as they consider essential in readiness for submission to the proper authority. The London County Council "fathered" the Act of 1894 through Parliament, and the writer believes they have already collected much material for a proposed new Act.

It is not suggested that the Concrete Institute should take the initiative in the matter, but, having already been recognised by Parliament in the 1909 Amendment Act, it should be prepared at the right time to suggest such amendments as will conduce towards sound construction on economical lines.

The Act should be clearly understood by all who read with average intelligence. It has to be administered by the London County Council and district surveyors. There are two important ways in which the Act needs amendment—(1) By making clear certain ambiguous and faulty wording, or wording that has been the subject of ambiguous or unsatisfactory decisions, and (2) by adding to or deducting from the existing provisions and requirements.

The chief [illegible] the Act are [illegible] (1) safety of [illegible] and protection of streets; (2) sound construction of buildings; (3) the diminution of danger arising from fire; and (4) more light, air and space round buildings.

The author then summarised the existing Acts, and made detailed suggestions for their improvement. In conclusion, he again emphasised the position which he submitted the Concrete Institute should adopt. It had already been recognised as an authority by the Legislature in the Amendment Act of 1909, and it would be ready to render able assistance when a new Act or another Amendment Act was in contemplation.

A London County Council Appointment.—It is proposed by the London County Council to invite by public advertisement applicants for the position of valuer rendered vacant by the retirement of Mr. Andrew Young. The salary offered is £1,500 a year rising to £1,800.

D

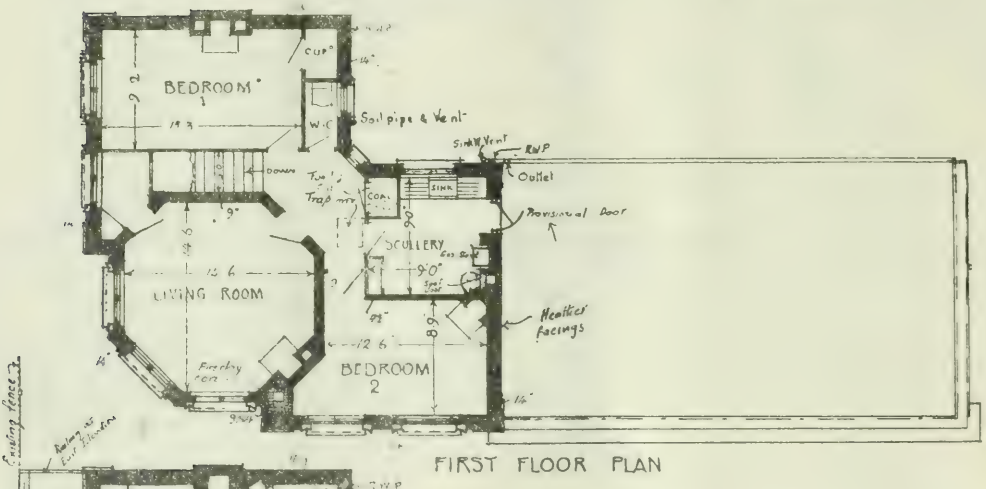
DEPTFORD SLIPPER BATHS SCHEME.

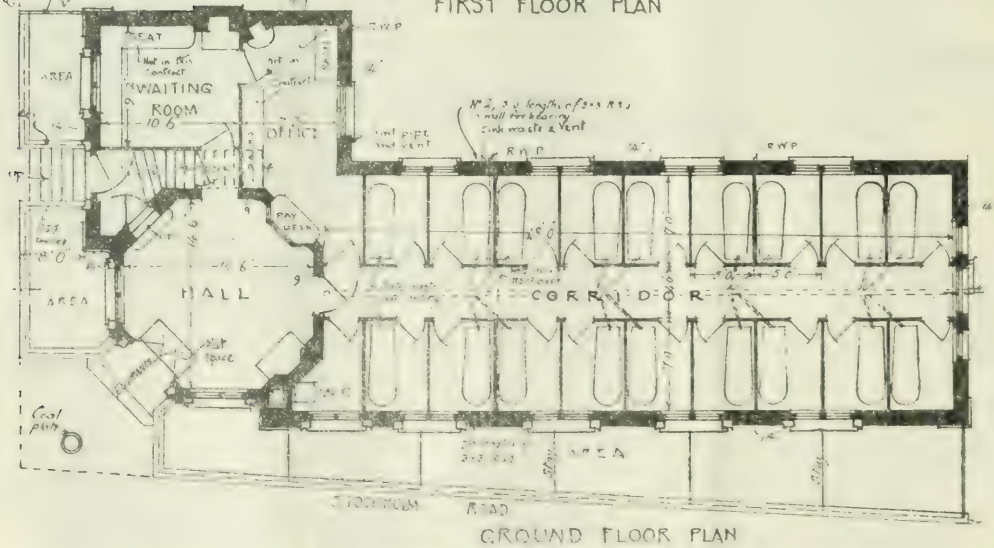
These new buildings, the foundation-stone of which was laid by the Mayor of Deptford on Saturday last, will provide for eighteen baths, for which a charge of 2d. per bath will probably be made.

The entrance to the baths will be at the corner of two thoroughfares—Ilderton-road and Stockholm-road—and will give access to a large octagonal-shaped hall. Leading from the hall there will be a waiting-room and the office, with pay desk, where the bather will obtain his towels and ticket. The bathrooms will be tiled from floor to ceiling.

On the first floor, on a portion of the site, the superintendent will live, and he will be provided with a spacious flat, containing a living-room, two bedrooms, and a kitchen-scullery.

The site itself is situated at a depth of about 10 ft. below the road level, and it has therefore been neces-





Deptford Slipper Baths.

[illegible] to [illegible] The building on piers [illegible] to bring the level of the ground floor up to that of the street.

The excavation is of red brick relieved by artificial stone dressings, and the building is constructed throughout of fireproof materials.

The baths will be of the best fireclay, supplied by Messrs. Shanks & Co., Limited. The buildings, it was stated at Saturday's ceremony, are expected to cost £2,400, a sum owing to the rise in the cost of materials 20 per cent in excess of the estimate.

The architects are Messrs. Joseph & Smith, 83 Queen Street, Cheapside, E.C., and the contractors are Messrs. W. S. Barton & Co., of Clarence Gate, W.C.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it not to be hoped that the commission appointed by the President of the Local Government Board to inquire into the sufficiency or otherwise of the existing requirements with respect to the construction, &c., of heavy motor vehicles, will take a broad view of the matter? While it is to be hoped, on the one hand, that the leaders of the country will not succumb to too rigid and restrictive regulations, on the other hand, any alterations in the present law which may be considered necessary should not only be rigidly enforced, but should be such that any vehicle using a road could not do unnecessary and excessive damage.

* * * *

Is it not rather to be regretted that the experimental lengths of reinforced-concrete road which have been constructed by the county surveyor of Kent near Gravesend have not proved satisfactory? Would it not have been rather a good thing if road engineers could have had "another string to their bow," so that if there was a "corner" in bituminous mixtures they could have fallen back on concrete. But was it not rather to have been expected that an unprotected concrete surface would fall a victim to the hammering and grinding actions of the traffic, which is considerable on the sections of road referred to?

* * * *

Is it not to be hoped that the working men of this country, who are now "having the time of their lives" as regards high wages, will not neglect to make provision for the future? Do they realise that the cost of this great war will have to be met, and that for many years to come economies will have to be practised, that there will be less capital invested in commercial undertakings, and that there will certainly have to be a reduction in employment and in the scale of wages?

* * * *

Who is responsible for the removal of temporary obstructions in the streets of the Metropolis? Is it not almost inconceivable that last Thursday a partially broken-down motor van was allowed to remain half across the footpath in Victoria-street for nearly the whole day? Is not one tempted to raise the time-worn cry of "Where are the police?"

* * * *

Should not Bermuda be an ideal place to live in when we hear, on the authority of Mr. Bertram Kershaw, in the paper he gave recently at the Institute of Sanitary Engineers, that motor cars are not allowed there? Would it not gladden the heart of some road engineers if the same restriction were in force in the United Kingdom?

* * * *

Why is it that, in the opinion of the State, a laundry-maid is of more importance than a municipal surveyor? Have we not lately seen an official advertisement asking for laundry-maids for Red Cross military hospitals, an inducement held out to applicants being that they will become "permanent civil servants of the State, and will be entitled to superannuation privileges under the Superannuation Acts"? For how many years past have municipal surveyors been agitating for superannuation privileges, which have been denied them? Is the work of a laundry-maid more important or more strenuous than that of a surveyor?

* * * *

Has not the question as to what is the proper definition of a "sanitary engineer" often exercised our minds? Shall we be much helped in a solution of this problem by a statement recently made in a paper as to the offers for the position of Government [illegible] the applicant being [illegible] a 'sanitary engineer who adds paperhanging as an additional qualification'"? Do we not know that plumbers delight to call themselves sanitary engineers? But is not this the first time that paperhangers have appeared in the lists to claim this title?

WILTSHIRE SURVEYORS' ASSOCIATION.

MEETING AT CHIPPENHAM.

The [illegible] meeting of the [illegible] Council Association was held at the Angel Hotel, Chippenham, on Saturday afternoon. Before proceeding to business the members were entertained to luncheon by the president, Mr. J. George Powell (county surveyor of Wilts), who presided, his guests including the Mayor (Alderman J. C. Coles), Mons. P. D[illegible] (Chippenham), Messrs. E. P[illegible] Dr[illegible], A. E. Adams (Chippenham), A. H. Lapham (Chippenham Rural), H. G. Nicholson Lailey (Trowbridge Urban), W. H. Stanley (Westbury Rural), C. G. M. Cross (Wootton Bassett Urban), H. [illegible] (Chippenham Rural), T. J. Huxham (Amesbury), G. Drewett (Calne), E. B. Lees (Bradford), [illegible] (Chippenham Main Roads), W. J. Godfrey (Cricklade), J. Godfrey (Calne Rural), G. Parker Pearson (Marlborough), E. P. Pearse (Melksham), [illegible] (Warminster), W. H. Long (Wilton), Mr. [illegible] (Melksham).

MAINTENANCE AND COST OF ROADS.

At the subsequent business meeting, Mr. J. G. Powell, the county surveyor of Wilts, delivered an address on the effect of modern traffic and the maintenance and cost of roads. In the course of his remarks Mr. Powell said:

Since, say, 1903 the number of mechanically propelled vehicles has increased to an alarming extent. Before that date, so far as I am able to ascertain, only some 1,100 to 1,300 motor cars were in use, whereas the number using the roads of England and Wales now (exclusive of military) is certainly not less than 250,000, and included in this large number are some 12,000 to 15,000 heavy motor cars; to the use of these I attribute the greatest injury to roads. We [illegible] enormous amount of wear and tear now compared with, say, 1903.

I am aware that a great number of motorists, including owners of heavy motor cars, also owners of traction engines, are of opinion that the main roads of the present day should be capable of carrying without injury the weights of all mechanical traffic, and assuming damage ensues—and invariably it does—the cause is attributable to defective road making or maintenance. I am not egotistical enough to say there are not some defects in road making and maintenance, but, speaking broadly and generally, the roads are judiciously and scientifically made and maintained. The [illegible] cause of damage to roads is not due to defective management, or the parsimony which is sometimes alleged to local authorities, but an omission [illegible] on the part of the Legislature.

In order to show this I must take you back a few years. In 1835 an Act, known as the Highway Act, 1835, was passed, and a number of Acts have been passed in respect of road administration. From a perusal of these several Acts, and more particularly the dates on which they were passed, it will be seen that nearly in every instance an Act in respect of the use of locomotives and other mechanically propelled vehicles on roads has preceded the Highway Act. In other words, the Legislature has legalised a traffic on the roads before they were made capable of carrying such traffic. It is inconceivable that measures so drastic should have been taken without inquiry having first been made as to whether the roads were capable of carrying the greatly increased weight of traffic. A very great injustice to the ratepayers was undoubtedly done by legalising such traffic. The roads should have been made capable of carrying it by a grant from Imperial funds before such traffic was allowed on them. This great injustice has been felt for a considerable time, resulting in a number of resolutions having been passed by various highway authorities and sent to the County Councils Association and other bodies. The outcome is that at last the County Councils Association have been instrumental in getting the Local Government Board to appoint a committee to consider the matter.

[illegible]

Auckland, New Zealand, Main Drainage.

£365,000 SCHEME INAUGURATED.

The citizens of Auckland, New Zealand, like those of all other cities in the Dominion, have given much consideration to the question of main drainage; but, owing to the city's situation on the shores of the Waitemata Harbour, no great urgency manifested itself in dealing with the problem until the development of the city and the extension of its suburbs brought the matter into prominence.

As far back as the year 1879 Mr. W. Clark, M.INST.C.E., of London, submitted to the city council a comprehensive report on the drainage of Auckland and its suburbs, after a visit paid by him to Auckland in June, 1878; the population of Auckland City was then 13,731 persons, and of the whole district dealt with by Mr. Clark in his report—viz., the City, Parnell, Ponsonby, Arch Hill, Karangahape, Newmarket, Grafton, Remuera, Eden Terrace, Newton and Richmond—26,600 persons, while the population of the provincial district was 82,490 persons.

Mr. Clark recommended the construction of upper and lower intercepting sewers, and of a pumping station, settling tanks and filters, and an outfall sewer at St. George's Bay, with provision for extension to Hobson Bay should the occasion require. No result came of Mr. Clark's visit and report, but the city council from time to time extended the existing sewers and constructed new ones in the various gullies discharging into the harbour, the sewers being in no case, however, taken below low-water mark.

In 1902 Mr. A. A. Wrigg, the then city engineer, furnished a report on the drainage of the city, expressing the opinion that the extension of the existing sewer outlets to low-water mark would render the combined system then existing in the city efficient, economical and sanitary.

In October, 1903, the council invited Mr. R. L. Mestayer, M.INST.C.E., of Wellington, to visit and report on the best scheme of sewage disposal for Auckland City, and about the same time the Auckland Harbour Board decided to prohibit the discharge of raw sewage into the harbour. Mr. Mestayer duly furnished his report in May, 1904, in which, after having dealt with the various systems of sewage disposal for cities, he made the following recommendations: (1) The re-sewering of the city on the separate system; (2) the lifting of the sewage, where necessary, by Shone ejectors, into a main intercepting sewer to be carried along the foreshore; (3) the treatment of the sewage in septic tanks, and subsequent discharge in the harbour at Cox's Creek.

Eventually it was decided to refer Mr. Mestayer's report to Mr. G. Midgley Taylor, M.INST.C.E., F.C.S. As a result of this Mr. Taylor's firm, Messrs. John Taylor, Sons & Santo Crimp, furnished a report to the city council, dated September 25, 1905, containing the following recommendations: (1) The abandonment of Mr. Mestayer's scheme; (2) the adoption of an outfall in the neighbourhood of Okahu Point; (3) the utilisation of existing sewers as far as possible; (4) the construction of a main intercepting sewer from the outfall to Cox's Creek on the combined system, or six times the dry-weather flow principle.

In March, 1906, Mr. Walter E. Bush, ASSOC.M. INST.C.E., was appointed city engineer, and prior to leaving England, he consulted with Mr. G. Midgley Taylor with reference to the latter's report, and immediately on arrival in Auckland was instructed to report upon the schemes submitted by Messrs. Mestayer and G. Midgley Taylor respectively, the report being furnished on March 26, 1907. Generally, Mr. Bush concurred with Mr. Taylor's views of the scheme prepared by Mr. Mestayer, and concluded by recommending (1) the adoption of a comprehensive scheme to embrace not only the city but also those suburban districts whose natural drainage was towards the Waitemata Harbour between Okahu Point and Motion's Creek; (2) the adoption of the broad lines of Mr. Taylor's scheme; (3) the obtaining of the consent of the Auckland Harbour Board to the direct discharge of the sewage into the sea at Okahu Point; (4) the opening up of negotiations for the acquisition of the native reserve at Orakei as a drainage reserve.

Subsequently a conference of representatives of the city council and the various suburban boroughs and road boards agreed to instruct Mr. Bush to prepare a comprehensive scheme for the drainage of Auckland and its suburbs, and further, to apply to the Harbour Board for permission to discharge the sewage into the harbour at Okahu Point. On receipt of the application the Harbour Board instructed their engineer, Mr. W. H. Hamer, M.INST.C.E., to conduct an exhaustive series of float tests, and to furnish them with a report on the advisability, from the Harbour Board's point of view, of the adoption of the scheme, especially of that portion relating to the direct discharge of sewage into the harbour at Okahu Point. At a later date the Harbour Board decided to call in the services of an independent engineer from Australia to report on this phase of the question. In view of this latter decision, and the possibility that further conflicting opinion might have been given by the engineer so engaged, it was decided, on the advice of the city engineer, to invite Mr. G. Midgley Taylor to visit Auckland so that an authoritative opinion might be obtained on the very much discussed question of the desirability of discharging raw sewage directly into the harbour.

Mr. Taylor visited Auckland in January, 1908, and, after making a careful inspection of the whole district and examining the draft scheme prepared by the city engineer, and the results of the float tests prepared by the Harbour Board engineer, he furnished a comprehensive report on the whole question, in which he expressed his approval (1) of the adoption of a joint scheme to serve Auckland City and suburbs; (2) of drainage on the combined system; (3) of direct discharge of the sewage, after screening, into the sea at Okahu Point; (4) of the line of the main intercepting sewer suggested by the city engineer. Mr. Taylor also expressed his strong opinion that the city should seek to extend its boundaries before commencing the work of main drainage, so as to embrace within its government all those districts included in the area covered by his report.

The Drainage Board, consisting of the mayor and members of the city council, which was later on set up to carry out the main lines of the scheme, appointed Mr. Bush as drainage engineer, and in September, 1909, the contract for the construction of the first section of the main sewer was let.

OUTLINE OF SCHEME.

Broadly, the scheme as carried out embodies the following main features: (1) Direct discharge of the sewage, after screening, into the sea at stated periods of the tide; (2) the intercepting of the various gully sewers discharging into the Waitemata Harbour by means of a gravitation sewer about 8¼ miles long; (3) the connection of the districts situated off the line of the main sewer by branch sewers; (4) provision for the carriage of combined sewage and storm water not exceeding six times the maximum dry-weather flow; (5) provision of pumping stations for such areas of the board's district as cannot be drained by gravitation into the board's main sewer, conditional on such districts being sewered on the separate system. The area of the board's district is 13,086 acres, in addition to which the main sewer is capable of serving the Orakei-road district and portions of the Mt. Roskill and Avondale road districts—an additional area of about 5,700 acres. The scheme is designed to serve an ultimate total population of 280,000, on the basis of six times the dry-weather flow of 35 gallons per head, or a total capacity of 98 million gallons per day.

The configuration of the district is irregular, both as regards its boundaries and general levels. Roughly speaking, the geological formation of the northern portion of the district is of yellow clay on Waitemata marl, while the southern portion of the district consists principally of volcanic scoria and lava rock. The whole district is more or less deeply indented, rendering tunnelling operations necessary on nearly every portion of the main sewer and branches, while the numerous projections to the north of the main gravitation sewer have rendered the construction of small intercepting sewers necessary.

The main outfall sewer is 1,213 ft. long, with its point of discharge situated 875 ft. north-east of the Orakei cattle jetty. For a length of 732 ft. from the point of discharge it consists of two 48-in. diameter cast-iron pipes, with turned and bored ends, fixed on cast-iron cradles at 12-ft. centres, to which the pipes are held by cast-iron straps; the cradles, surrounded with concrete, rest on a good foundation of White

[illegible] is 27 ft. below high-water mark (the board's datum), [illegible] below high-water mark.

[illegible] Bay, and have been [illegible] any future esplanade which may be made along the foreshore of the harbour; the over-all length is 1,296 ft. 6 in., and the width 106 ft., the average depth of contained liquid being 9 ft. 1 in., and the total storage capacity 7,[illegible],000 gallons. For [illegible] reasons, and in order to permit of cleansing or repairs being effected with the least curtailment of capacity, the tanks have been formed in three separate compartments by longitudinal walls running from end to end. The tanks have been constructed of concrete throughout, the outer walls on the western side and two ends being of mass concrete, 3 ft. wide, on a foundation 4 ft. wide, and on the eastern side 2 ft. 6 in. wide at the bottom, tapering to 20 in. at the top. The rest of the work is of reinforced concrete. The division walls are 12 in. wide, and the columns, of which there is a row in the centre of each tank, are 14 in. square, the total number of columns being 195. The floors vary from 7½ in. to 9 in. in thickness. The whole of the tanks have been covered by a reinforced-concrete roof, with sections set apart for roadway, carriageway and tramway tracks, should these be required in connection with any scheme for an esplanade, and a conduit has been formed in the outer wall to receive mains for gas, water or electricity.

At the south-eastern corner of the tanks are placed the screening and detritus and valve chambers, the whole being covered by a handsome brick building on a stone base, in which is installed the machinery required in connection with the screening of the sewage and the removal of inorganic detritus. A valve chamber has also been placed at the north-western corner of the tanks for controlling the discharge of sewage at the proper stated periods of tide.

MAIN INTERCEPTING SEWER.

The main intercepting sewer, when finished, will be 8¼ miles in length, of which 6¼ miles are now completed. The ruling gradient is 1 in 3,000, and the sewer has been designed on the combined or six times dry-weather flow principle. It is of standard egg-shape, or oviform section, throughout.

The first section of the main sewer commences at the storage tanks, where the sewer is at its largest cross-section, its internal dimensions being 8 ft. 6 in. by 5 ft. 8 in., with a discharging capacity of over 2,500,000 gallons per hour, or sufficient for a future estimated population of 280,000 persons at 210 gallons per head per day. It follows the curve on the beach, so as to form, if necessary, the retaining wall for the future esplanade, and is constructed of concrete, with steel reinforcement in the arch portion; from the beach it is carried in tunnel through to the eastern side of Hobson Bay, the invert and sides being of concrete and the arch of brick. The total length is 3,824 ft.

The second section of the main sewer has a total length of 6,580 ft., and is wholly constructed of reinforced concrete on reinforced-concrete piles or concrete piers, at 20-ft. centres, the sewer forming a continuous box girder. It is of similar internal cross-section to the first section—namely, 8 ft. 6 in. by 5 ft. 8 in. for a certain distance, after which the dimensions are 8 ft. 3 in. by 5 ft. 6 in. to the end of the section.

The third section of the main sewer is principally in tunnel, and is 7 ft. 9 in. by 5 ft. 2 in. internal diameters, the total length being 6,840 ft. It is of concrete throughout, concrete blocks being moulded and placed to form the arch.

The fourth section of the main sewer, principally in tunnel, is 7 ft. 6 in. by 5 ft. up to a certain point, the remainder being 7 ft. 3 in. by 4 ft. 10 in. The total length is 6,659 ft. The sewer is of concrete throughout.

The fifth section of the main sewer, principally in tunnel, has an internal diameter of 7 ft. 3 in. by 4 ft. 10 in. for a distance of 667 ft., the remainder being 6 ft. 9 in. by 4 ft. 6 in.; the total length of the section is 6,765 ft. This section contains the longest tunnel on the line of sewer—some 3,630 ft. between shafts. Its construction generally is similar to that of No. 4 section.

The sixth section of the main sewer, principally in tunnel, has a total length of 6,025 ft., the internal [illegible] 5 ft. by 3 ft. 4 in. to the end of the section.

[illegible] partially in open cut-and-cover and partially in tunnel, will have internal dimensions of 5 ft. by 3 ft. 4 in. for a distance of about 1,000 ft., thence 4 ft. 9 in. by 3 ft. 2 in., and finally 3 ft. 6 in. by 2 ft. 4 in. to the [illegible]

Overflow chambers have been provided at five points [illegible]

The scheme comprises, in addition to the main sewer, fourteen branch sewers of a total length of 79,015 ft., or, say, 15 miles, making, with the main sewer, a grand total of 23¾ miles of sewer.

In order to deal with those portions of the board's district where the general level is such that it is impossible to drain them by gravitation into the main intercepting sewer, the board will provide electrically operated pumping stations, to which sewers on the separate system will be laid by the local authorities. It is the present intention of the board to proceed with the construction of four pumping stations within the city area.

This concludes the description of the board's scheme; but, as stated, each local authority is responsible for the reticulation of its district and the connection of each with the board's main and branch sewers. The carrying out of this latter work will complete the scheme in its entirety.

The capital expenditure up to the date of the inauguration of the works—which was performed a short time ago by the Mayor of Auckland (Mr. C. J. Parr)—was, in round figures, £365,000, which includes cost of construction, engineering, inspection and administration, payment of compensation claims and legal expenses incurred therewith, and allotment for payment of interest and sinking fund, with preliminary expenses refunded to the city council and the cost of raising [illegible]

ROAD WORK IN ST. AUSTELL URBAN DISTRICT.*

By E. D. Groves,
Surveyor.

During the year the roads have been repaired and [illegible] the usual process of water-bound macadam, with stone obtained from the council's quarry at Chipponds.

Tar-spraying was carried out on several portions of the main roads, and also on the light traffic secondary roads. The cost, inclusive of all labour and materials, worked out at 1·03d. per square yard treated. Tar-spraying has a great advantage on well-constructed macadam roads. It has proved of immense benefit in the prevention of dust and mud on roads subject to heavy and rapid traffic, and adds considerably to the life of those roads, while it is a distinct advantage from a health point of view where the roads are made a playground by children.

Where tar-spraying has been done on gradients it has been found to be slippery for horse traffic at certain periods. Surface gritting is done, but this increases the production of slippery mud, as the material is crushed by the traffic.

Notwithstanding the change that has taken place in the class of vehicle on the roads at the present time, the percentage of self-propelled vehicles to the total volume of traffic in our district is comparatively small, and the difficulty has still to be faced of constructing roads that will serve equally well for the horse traffic and the self-propelled vehicles; at the same time a different method needs to be adopted in the construction of the roads so that the surface can be kept waterproof and as free from mud and dust as possible on account of the increasing self-propelled traffic.

I went fully into the question in my report of last year, and I would strongly recommend that trial lengths of road be laid down with the patent Rocmac binder. The initial cost would be slightly above water-bound macadam, but this would be more than met by the convenience and comfort of the public having clean roads during the wet season. Roads laid with Rocmac in other districts have been found to give a more lasting surface, and one which affords at the same time a most excellent foothold for horses. The great advantage of the material is that it can be laid in wet weather even better than in fine weather, and consequently the work is not interrupted as in the case of tar roads.

* Extract from Annual Report for 1914.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

Mr F. J. Manning, of Luton, has selected the following books in respect of the February premium, and they have been duly forwarded to him:—

Prof. Jamieson's "Applied Mechanics," vols. 2 and 3 (Griffin).

"Sewerage Systems," by Hugh S. Watson (Lockwood).

QUESTIONS.

This week answers are invited to the following questions:—

463. Bomb-proof Dug-out. Give sketches of a bomb-proof dug-out to hold five people. (Tico.)

466. Road Making.—Describe a few simple tests that will enable an engineer to ascertain the quality of the bitumen and filler to be used in a bituminous macadam road. (Eneer.)

467. Destructors—Forced Draught.—Discuss the relative advantages of steam jet blowers and fans for producing forced blast in destructors. (Eneer.)

468. Girder Design.—Explain a method for determining the position of the web stiffeners in a plate girder. (J. F., *Padiham.*)

469. Sewage Sprinklers. Give a good practical method of marking off the holes in the distributing arms of revolving sprinklers. The diameter of holes to be constant. (C. A. B., *Catford.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

465. Girder Design. What are the main points to be borne in mind when determining the [illegible] girder for any particular situation, local conditions, such as cost to be carried upon, and [illegible] appearance are the chief factors to be considered and [illegible] therefore impossible to lay down any definite rules on the subject. For instance, for most road bridges subject to heavy live load a suitable type is the solid bowstring girder. The panels to be comparatively small where a great deal of steel is to be expended. Owing to the advantage of being relatively light, and offers less resistance to wind [illegible] plate girder is sometimes used; however, as, for instance, when a lattice girder railway [illegible] by a passing train, the total wind pressure on the bridge is the same as if a [illegible] had been used. Warren or N-girders are [illegible] for bridges subject to light loads only, such as footbridges, &c. For very large [illegible] stiffening lattice girder, or a succession of cantilevers [illegible] forced concrete is sometimes given the preference [illegible] of girders in bridge work, the following are useful rules to obtain a starting-point for more exact calculations. The I section is most common for plate girders of uniform section, and the depth in feet [illegible] where S span in feet. [illegible] varies from $\frac{S}{30}$ to $\frac{S}{40}$. The [illegible] is approximately $\frac{W}{400}$ [illegible] W is the total load in tons. From these rules we can begin our calculations for obtaining more exact dimensions. The cross-sectional area of flange can be found from the formula

$$B.M. = f a d$$

where B.M. = maximum bending moment

f = safe working stress for material

d = depth of girder

a = cross-sectional area of one flange.

This formula neglects the resistance of the web to bending, but as this is only a very small quantity, as may be seen from the modulus figure of an I section, the formula is quite legitimate, and, in fact, gives an additional margin of safety. It can only be used for a girder of symmetrical section. Should it be desired to take into account the resistance of the web to bending, the formula

$$B.M. = f \frac{I}{y}$$ can be used, where

I = moment of inertia of section,

y = distance of outer fibres from neutral axis.

This formula may be used for any section of girder. Allowance must be made for rivet-holes when calculating the tension flange. Care must be taken to see that total thickness of flange (and cover-plates at joints, if any) does not exceed $4d$, where d = diameter of rivets in flange. An approximate calculation to test the web for resistance to shear is:—

Intensity of shear stress = $\frac{S}{A}$ where

S = [illegible]

A = [illegible] of web.

The above rule assumes the intensity of shear stress to be constant over the cross-section of the web, which is not the case. Should a more exact [illegible] be desired, use the rule:

Maximum [illegible] = $\frac{3}{2}$ [illegible] intensity.

In large plate girders the [illegible] happens, it [illegible] at the point of [illegible] i.e., at the ends of the cross-girders—and L or T stiffeners are riveted to the web at such points. The calculation of the exact positions at which [illegible] should be placed is somewhat a [illegible] point, but they should undoubtedly be more numerous near the abutments, where the shear stress is greatest. Bowstring plate girders are useful for large spans, but as they come under the heading of girders of uniform strength the above formulæ, &c., do not apply. They are designed so that the intensity of stress in the flanges is uniform throughout the span, the cross-sectional area of flange at any point being proportional to the bending moment at that point.

To find the [illegible] from it a stress diagram may be obtained. Should the stresses in the members prove to be inconveniently large, the depth or the number of bays may be increased, and a fresh diagram drawn. The dimensions of lattice girders when used as stiffeners in suspension bridges can be obtained [illegible] the formula:

Maximum bending moment = $\frac{W}{L \cdot S}$

.. [illegible] = $\frac{W}{10}$

where W = [illegible]

L = [illegible]

The dimensions of reinforced concrete beams vary a great deal, according to the system of reinforcement adopted: and here, again, empirical rules are

impossible. The bending moment for instance, is affected by the method of end-fastening, and in some cases is difficult of determination to any degree of accuracy.

The dimensions of a simple case can be obtained from the formulæ

$$B.M. = f_c \frac{bx}{6}(3d - x) = \frac{f_t a}{d}(3d - x)$$

where f_c = safe intensity of compressive stress in concrete,

f_t = " " " tensile stress in steel,

b = breadth of beam,

a = cross-sectional area of tensional reinforcement,

x = distance of neutral axis from top of beam,

d = effective depth of beam,

the effective depth being measured from the top of the beam to the bottom of the horizontal reinforcement.

$$\text{Also } f_c \frac{bx}{2} = a f_t$$

and for shear we have $a = \frac{W}{4d}$

where a = total area of shear reinforcement,

f_s = safe stress as ditto,

W = load on beam,

L = span,

d = effective depth of beam.

All dimensions must, of course, be modified to suit local requirements as to local traffic, etc. Of the three materials mentioned, wrought-iron and steel have for many years been recognised as reinforced concrete constructors of the highest order, developed at late largely owing to the enterprise of time making a specialty of this form of construction. Wrought-iron is given preference by some most manufacturers, basic standard specifications in the latter material only. While there is little difference as regards cost, steel can be safely stressed to 6 tons per square inch, both in tension and compression, thus giving symmetrical sections. The safe stress of wrought-iron being 4 tons per square inch in tension and 4 in compression. In a plate girder of I section, if we use wrought-iron, it is therefore necessary to make the compression flange of greater cross-sectional area than the tension flange. From the point of view of economy, reinforced concrete has much to recommend it, and in many cases it is greatly adopted for bridge structure in appropriate cases, but, since it is a comparatively new form of construction, it is safe still as yet to form an opinion as to its lasting qualities. The theories extant as to the design are not so straightforward as those with reference to structural iron and steel, to say nothing of the superior homogeneity of the latter. The material employed will depend in the main upon the type of girder decided upon, and the conditions of loading and span. (E. K., *Newport*.)

In designing a girder the first consideration is stresses and strains. Strain may be defined as the change of form of a body by the application of external forces: stress may be defined as the internal forces or resistance set up in the fibres of a body in opposing the strain. Stresses in materials are proportional to the strains, so long as there is no permanent alteration in the form of the body acted upon. The three kinds of stresses and strains are: (1) Compressive or positive stresses and strains; (2) tensile or negative stresses and strains; (3) shearing stresses and strains. (a) For spans up to 15 ft. or 20 ft., it may be assumed that beams of plain rolled section are most suitable; for spans of 15 ft. to 90 ft. plate or box girders, while beyond this limit lattice girders will generally be most suitable. Rolled beams are not suitable for long spans because from their mode of manufacture they are necessarily of uniform section throughout their entire length, and consequently much heavier at the ends than is required. A rolled beam is not of uniform strength in the same sense as a built-up girder can be made, and for this reason necessitates considerable waste of material. In practice beams are usually made I section, because the most economical section is that in which as much as possible of the metal is placed in the flanges. In girders of this form the following is an approximate formula for the modulus of the section:—

$$Z = D A + \frac{a D}{6}$$

$$= D\left(A + \frac{a}{6}\right)$$

Where B = [illegible]
A [illegible]
D [illegible]
[illegible]

(a) The following [illegible] for obtaining the allowance for the weight of girders themselves:

[illegible] $= \frac{W}{}$

Where W [illegible]
span in [illegible]
[illegible] depth.
[illegible] per square inch
[illegible] may be taken 1,200 to 1,400 for small plate girders and 1,700 to 1,900 for truss bridges.

Depth of Girder.—For plate girders the economic depth may be taken as from one-tenth to one-fifteenth of the span, and for box girders one-twentieth is often taken.

Breadth of Flange.—After fixing upon the depth of the girder, the next step is to fix the breadth of the flange, which is taken as about one-third of the depth.

Approximate Area of Flange.—Find the maximum bending moment, and decide the working stress; then

$$\text{[illegible]} = Z = \frac{M}{}$$

Using [illegible] $I = Z = D\left(A + \frac{a}{6}\right)$

Where D = depth between centres of flanges, generally taken as [illegible] centres of flanges,
A = [illegible] of the flange excluding the area of rivets [illegible] area of web,

Uniform loading $M = \frac{W L}{8}$

$\therefore$ Formulæ become

$$A = \frac{W L}{8 D} - \frac{a}{6}$$

$$A = \frac{M}{D} - \frac{W L}{8 D}$$

[illegible] deduct twice [illegible] of rivets [illegible] that in zig-zag riveting.

[illegible] has advantages over wrought iron, its strength is from 40 per cent to 50 per cent greater, and it has a proportional superiority in elasticity and ductility, though opinions upon this latter vary, some authorities holding that at present in the manufacture of steel the high-grade strength has not been accompanied with a corresponding high grade of ductility. The advantages of superior strength are great, especially in bridges of large span, as the dead load of the structure will be very much diminished. A reinforced-concrete beam is a beam in which the concrete and the reinforcing material, which we will assume to be steel, are so combined as acting together as one material, the two materials being so arranged relatively to each other as to produce a more economical material than either acting alone. Concrete is a material which is weak in resistance to tensile stresses. In designing structural work, the best material, of equal strength, to be used will be the cheapest—the artistic appearance being considered, and safety and strength being the objects in the design. Steel, volume for volume costs about fifty times concrete, and is about thirty times as strong as concrete in compression, and 300 times as strong in tension; consequently, to carry a given load in compression, concrete will cost about three-fifths steel, while for tension concrete will cost about six times that of steel. In structures, therefore, in which some portions are subjected to compression and some to tension, it is possible to obtain, by a scientific combination of steel and concrete, a more economical result than would be possible with either material separately. (E. W. P., *Southampton*.)

DIRECTION POSTS.

To the Editor of The Surveyor.

Sir,—The article under the above heading by "Observer," which appeared in your issue of the 5th inst., was written without any consideration of those who have done original work in connection with this subject, except the one individual whose name is mentioned.

The motor papers, and many others, in December, 1913, described the system of semaphore signs designed by me in conjunction with one of my assistants, Mr. J. Bowen.

When discussing these signs with Mr Rees Jeffreys early in 1914 he said that no system as to what should appear on a direction arm had ever been formulated. Subsequent to this conversation, I devised the system given in the paper I read before the meeting of the Lower Thames Valley surveyors last December, that, as a rule, a direction arm should carry only two lines, the upper line that of the principal town to which the road leads and the distance thereto, while the bottom line gave the name and distance of the nearest town or village.

At this meeting, at which your representative was present, I exhibited slides showing my signs applying to Hounslow, and which I trust you may, in justice, now reproduce.

Fig. 2 in "Observer's" article is a facsimile of the sign I showed in the Bath road, except that "Observer" has substituted names, which destroys the value of the sign as—(1) indicating the angles of intersection of the roads to be met, and (2) either the name of the principal town or nearest town or village to which each road leads.

Dickens records the name of a Mr. Pecksniff who, I understand, made a somewhat similar mistake.—Yours, &c.,

C. H. Cooper, M.Inst.C.E., F.R.S.I., &c.,
Borough Surveyor, Wimbledon.

March 16, 1915.

THE MUNICIPAL PRACTICE OF CIVIC ART.

To the Editor of The Surveyor.

Sir,—The recent appointment of a parks superintendent for the city of Manchester is evidently about to cause a general shuffle in appointments of this nature among the larger cities of the country. This would therefore seem to be an opportune time at which to bring forward recommendations for that change of policy with regard to these appointments which must result from the broader view we are gradually adopting in this country with regard to matters of civic art. The time has gone when it was taken for granted that the dotting about in a miscellaneous manner of a few trees and shrubs and statues was all that could be expected in the way of attempts at artistic presentment within urban areas, and more extended and more universal travel has shown us not only that we are a long way behind Continental cities in this respect, but also that beauty in the city has a practical money-making value which can be reckoned in solid pounds, shillings and pence, besides contributing to the health and pleasure of the inhabitants.

It is therefore time also that we should cease to consider that the only qualifications necessary in the head of the city's public parks and gardens and open spaces is a knowledge of horticulture, or, at least, horticulture plus administrative ability, however necessary these may be. No city, not even the smallest, would think for a moment of appointing for its city architect a man whose only claim to fitness for the post was a thorough-going knowledge of the builder's trade, and yet our present policy with regard to the city's open spaces is exactly parallel to this, and, as we can all see, produces the same results. What I desire to advocate is that the position and duties of the parks superintendent in each city should merge in the larger appointment of city landscape architect, and that he, together with the city architect and city engineer, or other officer charged with the administration of the Town Planning Act, should form a triumvirate of experts, who would work together in harmony and community of aim for the æsthetic betterment of their city, chiefly, of course, by making sure that, when changes take place, control is exercised, and that they are so carried out as to add to its beauty and desirability, instead of detracting from them, as more usually happens at the present time.

It would be easy to prove that in nearly every case this æsthetic presentment can be given to necessary utilities without any increase of cost, if the matter is approached in the right way, but to do so would be to trespass unreasonably upon your space. I trust, however, that what I have said may lead to a careful reconsideration of our policy and some improvements upon current practice.—Yours, &c.,

Thomas H. Mawson, Hon.A.R.I.B.A.,
Lecturer in Landscape Design
to the University of Liverpool.

The University,
Liverpool.

RECRUITING FOR THE FORCES.

To the Editor of The Surveyor.

Sir,—I hope you will again allow me space in your columns to communicate with your readers on the subject of service in the Forces of the Crown.

Now that we are approaching the commencement of the great struggle in Europe, it behoves every man, whatever his age, seriously to consider whether he himself is doing all in his power to support Lord

The Surveyor
And Municipal and County Engineer.

Kitchener and the Government in their appeal to the country to organise resources. Every man who is able to join the Army should do so at once and those really unable to enlist should prepare themselves for the future, when they may be [illegible], so that the whole reserve of the nation may be called on for a great united effort.

The new Expeditionary Force and its reserve battalions are, of course, the first thought of the Government and the nation. But provided a man is keen and has grasped in true perspective the meaning of military training and service, he can find a place in the present military organisation of the country, whatever his age and whatever his capacity.

The Volunteers are being organised for those who cannot join the Regulars and Territorials, and although they occupy the last place in the military scheme, they can give real support to the Government. Every man who accepts the War Office conditions with regard to these corps thereby expresses his entire trust in Lord Kitchener, and shows that he appreciates the relative value of part-time training and full-time service.

The headquarters of the Architects' Volunteer Training Corps has now become the recruiting and equipment office for the Army, and is continuing its work of recruiting for the Royal Engineers and Sanitary Companies, both of which services are still in need of recruits. In addition to all kinds of skilled workmen, draughtsmen and surveyors can be accepted for the former, and men of sanitary experience are in demand for the latter.

The corps, which has now become the 4th Battalion (Architects) Central London Regiment of Volunteers, can offer excellent facilities for the men who are above military age, or who cannot at present join the Army.

The training centres are at St. John's Wood, Westminster and Holborn, in addition to Dulwich College, Loughton and Boreham Wood, where there are splendid areas for field exercises and manœuvring.

A school of arms has been started at Erasmus-street, Millbank, and this is open to all members who have become efficient in drill and musketry.

As a result of the War Office regulations, and some months of uncertainty, the corps is now composed of really keen men, difficulties are being met in the right spirit, and the prospects of service are most encouraging. [illegible] the [illegible] is of [illegible] to be attached to the [illegible] as possible.

All keen recruits will be most welcome, whether they come singly or as an organised body. Any corps wishing to amalgamate with and come into the 4th Battalion C.L.R. Volunteers will obtain every facility attached to the regiment, and will be able to retain its identity as far as is compatible with efficient organisation and discipline.

Join the Army at once if you can; if not, join the Volunteers. —Yours, &c.,

ALAN POTTER,
Chief Recruiter, 4th Battalion C.L.R.V.
18 Tufton-street, S.W.

ROAD TERMS.

To the Editor of THE SURVEYOR.

SIR,—I have read with considerable interest [illegible] in your last issue the definitions given by American road engineers to various materials, &c., used in road construction, and to observe that they call them "definitions," which is, of course, somewhat different to a "glossary." Most of their terms appear to agree with those used by me in my recently published "Glossary of Road Terms," but they are elaborated in some instances to greater length. Some new words are introduced, but, on the other hand, a very large number of useful words which I incorporated in my Glossary do not appear. Their definitions of asphalt and bitumen are not such as could be accepted by English road engineers without much more research and, if need be, argument. They give no fewer than eight different definitions of bituminous compounds, some of which are probably only temporary mixtures, more or less under trial. Of course, such "definitions" might be extended to any degree. The word "crown" is used to designate "camber," which, of course, could not be accepted in this country; they also use the word "grade" in the same sense. The definition of "gravel" is excellent, and much better than mine. The attempt to define "pitch" is distinctly good, and this may, or may not, be accepted in this country. On the whole, the American engineers are to be highly complimented on the excellent definitions at which they have arrived.

I can speak with some authority, as I know the difficulties I encountered in preparing my "Glossary." They may, or may not, have had the advantage of my Glossary to refer to, but I conclude that they had not seen it, as no acknowledgment to that effect is made. They give definitions of only 142 words, whereas in my Glossary I give very nearly 1,000 words. I still take credit for having started the idea of the necessity for some sort of glossary, and, having read the American definitions, I am glad to find that I was not very far wrong in my definitions, though I must confess that in some particulars they have greatly improved on them. No doubt some day, with the help of my Glossary and these American definitions, a useful technical dictionary of road terms may be produced.—Yours, &c.,

H. PERCY BOULNOIS.
7 Victoria-street, S.W.

ELECTROLYSIS OF PIPES.

To the Editor of THE SURVEYOR.

SIR,—Your recent editorial on the above subject is very much to the point, for it condenses the theory and existing safeguards into one short paragraph.

It is true that no paint, pitch, asphalt, or paper wrappings can possibly protect pipes or iron rods when subject to electric currents.

The disintegration of concrete when electricity comes into contact with water not only results in the loss of electric current, but certainly allows more ingress of dampness, and may result in severe structural defects. Indeed, it must appeal to any thoughtful person that when concrete becomes the consistency of mud—which it does when electrolysis occurs—it ceases to serve its purpose.

In condemning insulating joints you confirm the tests made by the American Bureau of Standards by saying that insulating joints are not to be relied upon as the sole means of protection, and, further, that the problem of preventing electrolysis has not yet been solved. In urging engineers to co-operate in order that everything may be done to study the subject with an open mind, you certainly appeal to them in the right direction.

My object in writing this letter is to state definitely that the subject is solved economically and definitely

by the use of waterproof concrete. The only point to watch is that the waterproofer will not affect either the tensile or compression strength of the concrete, even after prolonged periods.

It will appeal to all engineers that if concrete can be made waterproof easily and safely the danger from electrolysis is removed. In some cases it may not be necessary to waterproof the concrete, because a waterproof cement rendering would take its place, and in this way the cost will be even less.

It is not as if waterproofed cement were a new thing, because flat roofs have been waterproofed since 1908 with Pudlocd cement, and it is not as if waterproofed cement and concrete had not been tested by the highest authorities, because every Government Department is now using Pudlo in its cement. I mean by speaking of Government Departments the Office of Works, War Office, Admiralty, General Post Office, India Office, and the Crown Agents for the Colonies. All these departments are known to be extremely strict in their tests before general adoption of any material, and especially a new material. This fact alone should remove any fear or prejudice from the minds of engineers towards the use of waterproofed cement and concrete. Yours, &c.,

J. H. Kennie Gellenwood

King's Lynn.
March 24, 1915.

THE LONDON COUNTY COUNCIL AND THEIR STAFF.

To the Editor of The Surveyor.

Sir,—I noticed in your issue of the 12th inst. your article under the heading of the "London County Council and their Staff." At the conclusion of this you state that you consider the recognition of the General Purposes Committee, that we should not be allowed to represent any of the staff with regard to any grievances they might have, had some justification.

I am sure your readers will be interested to know that, as the result of our action, the original report was not only taken back by the chairman of the committee, but brought up in an amended form, by which we will be able to represent, at any rate, the clerks on the minor establishment, which at present form the bulk of our membership.—Yours, &c.,

Herbert H. Elim,
General Secretary, National Union of Clerks.

186-188 Bishopsgate,
London, E.C.
March 23, 1915.

A CANADIAN REINFORCED CONCRETE BRIDGE.

The accompanying illustration, reproduced by the courtesy of *Kahncrete Engineering*, shows a reinforced concrete bridge of the arch type, built at Port Arthur, to carry an electric railway, as well as ordinary vehicular traffic. It is of a large span, being 130 ft. between the abutments. The bridge was designed on the Kahn system by the Trussed Concrete Steel Co.

Reinforced Concrete Bridge at Port Arthur, Ontario.

MAIN ROAD PAVINGS IN THE METROPOLIS.

CAMBERWELL ENGINEER'S REPORT.

In his report for the year ended March 31st, 1914, Mr. Wm. Oxtoby, M.Inst.C.E., the borough engineer, mentions that large areas of wood-paved roads in Camberwell have survived the repayment of the original loans without any extraordinary expenditure on maintenance; but in several instances the defective condition of the paving has necessitated the relaying of the whole of the surface of certain roads, and provision is now being made each year in the estimates to deal on the same lines with some portions of the remaining areas.

In the case of the main roads, however, that the wood paving has run its life Mr. Oxtoby considers beyond question, and having regard to the marked changes in traffic occasioned by the rapid development of the motor vehicle, he regards it as essential that these highways should be entirely reconstructed at no distant date. During the past, as in previous years, large areas of the wood paving in Old Kent-road have been relaid; but, whereas in this and other thoroughfares the process of taking up, reversing and relaying the blocks on concrete has hitherto served to prolong the life of the paving, it has recently been found in this important main road that the more numerous and frequent services of motor 'buses and the ever-increasing volume, weight and speed of other mechanically propelled and heavy-horsed vehicles subjected the wood paving to such severe wear and disintegration that entire reconstruction with special dressed granite sett paving is being resorted to.

Glasgow Tramways Extension.—The Roads Committee of Upper Renfrewshire have sanctioned the proposed extension of the Glasgow Corporation tramway system from Netherlea to Clarkston on condition that the necessary road widenings are carried out.

Law Notes.

EDITED BY J. B. REGINIER CONDER, 57 Moorgate-street, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction, i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

RIVER POLLUTION—MANUFACTURERS—EFFECT OF LIABILITY OF LOCAL AUTHORITY.—The decision of the Divisional Court in *Ettrick Paper Board v. Lothburn Urban District Council* (noted ante, p. 389) has been reversed by the Court of Appeal. It will be remembered that the Judge of the Hawick County Court held that the council had not committed an offence under sec. 4 of the River Pollution Prevention Act, 1876, in permitting the flow of liquid polluted by sewage proceeding from a factory of paper manufacture. From this decision an appeal to the Divisional Court was decided that, as there was no application for an injunction, and that no sanction was required, they could not be sued under the section, but that any proceedings therein could be taken against the persons whose factory or manufacturing process was producing the noxious liquid. The Divisional Court accepted this view and reversed the decision of the County Court Judge without going into the merits of the case. The Court of Appeal overruled the Divisional Court on this point. Lord Justice Buckley said that by a Provisional Order in 1895 the Rivers Board were given all the powers and duties of a sanitary authority under the Act. The County Court Judge was of opinion that the council had been guilty of the offence charged, and gave judgment for the board. The case, appealed to the Divisional Court, and in the Divisional Court it was held that there was a defence that the water deteriorated so much that it could not be prevented, against under Part III., sec. 4, by reason of the restrictions contained in sec. 8. For himself he was not entertained the idea that the defence was raised in the Court below in the Divisional Court. The parties agreed that it was properly raised, and he thought that this Court could review the decision given upon it, because it appeared that the county court could not [illegible] clear that the judgment in the county court could not stand. They were in a position to give that court. The Divisional Court had not considered the case on its merits, and this court had nothing before them on which they could decide anything. In his view the liability of the council was not [illegible] by sec. 8 of the Act of 1876, which clearly authorised the board to bring the action against them. Therefore for the purpose of this action the council could not be made defendants unless there was an inference to be drawn from sec. 4, coupled with the restrictions contained in sec. 8, that the council [illegible] body to [illegible] to the Act. He thought he was entitled to the view that it was better that the [illegible] than that the business of a trader should be [illegible] interfered with. For that reason proceedings against a trader must be with the sanction of the Local Government Board. The result was that this appeal would be allowed with costs, and the cross-appeal against the judgment of the county court must be heard on its merits. The case was therefore sent back to the Divisional Court for this purpose.

CONTRACT—ARBITRATION CLAUSE—ALLEGED FRAUD—ACTION TO RESCIND.—An important question as to that to the effect of an arbitration clause in a contract was decided in *M[illegible] v. Bognor Urban District Council* (Court of Appeal). The plaintiff entered into a contract with the council to execute certain sewerage works for them, and one of the clauses of the contract provided that if at any time any question, dispute, or difference should arise between the council and the contractor on or in relation to or in connection with the contract, the same should be referred to arbitration, and that such submission to arbitration should be deemed to be a submission to arbitration within the meaning of the Arbitration Act 1889. While the work was in course of being carried out the plaintiff alleged that he had been induced to enter into the contract by false and fraudulent repre[illegible] plaintiff then brought this action, claiming—(1) A [illegible] for the loss he had sustained, and (3) an injunction to restrain the [illegible] dealing with his plant and material on the council's premises. The council applied to a Master for an Order staying the action on the ground that the dispute must be decided by arbitration, in accordance with the clause in the contract. The Master made the Order, and his decision was affirmed by Mr. Justice Coleridge. The Court of Appeal have now overruled this decision, and rescinded the Order to stay, on the ground that the plaintiff claimed a declaration that the contract was void, which, if proved, would render the submission to arbitration void also. The action will therefore proceed.

QUERIES AND REPLIES.

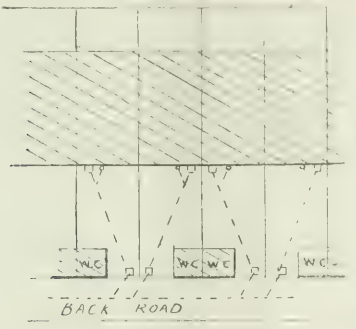
[illegible] "nom de plume." The letter X., [illegible] A Y Z [illegible] to engineer [illegible] surveyor.

[illegible] BANK.—H. V. S. writes: In an urban district a highway is situated on the side of a steep hill, and has on the lower side a wooded bank running down to a small stream at the bottom thereof. Owing to the exceptional wet weather and high winds several of the trees on the bank by the road became displaced, and the bank commenced to give way. The trees were cut down at the expense of the owner, but this has not stopped the trouble, as the roots, which are of very considerable size, are still slipping down the bank. I should be glad if you would inform me (*a*) whether the owner of the bank is liable for the support of the highway, and whether he could be called upon to provide such support where the withdrawal of it has arisen from natural causes, and through no act of his own other than, perhaps, neglect to have the heads of the trees cut down; also if, as a precautionary measure, although no evidences of trouble are showing at the present time, the council could call upon him to remove other trees which are liable to damage the road in the same way; and (*b*) should the council be liable for the new works necessary for the support of the road, which will probably be very costly, and comprise the construction of a concrete retaining wall near the stream and the making up of the bank with chalk and rubble, what powers of entry have they for this work, and what powers of user has the owner of the soil over the rubble and chalk embankment so formed? I may mention that the land, owing to the [illegible] cannot possibly be put to any use whatever by a private owner, except, perhaps, for growing timber, and it appears to me, although I have no evidence on the point, that this bank really forms a portion of the highway, and should never have passed out of the hands of the highway authority. My council is faced with a very large expense in this matter, which is one presenting many practical difficulties, and I shall be glad if you can clearly define for me the legal position before any work is done. I may add that the stream at the foot of the bank is an artificial one supplying the owner's water-mill.

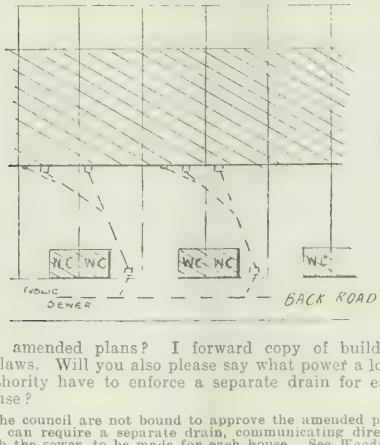
(*a*) If sec. 30 of the Public Health Acts Amendment Act, 1907, is in force in the district, and if the bank is dangerous to passengers, the council can require the owner to repair it. If the owner makes default, the council can do the repairs and recover the cost from him. But unless this section is in force the council cannot, in my opinion, call upon him to repair the bank unless they can show a prescriptive liability on his part; see *Stockport Highway Board v. Grant*, 40 J.P. 437. Under sec. 64 of the Highway Act, 1835, the owner can be compelled to cut down any tree, planted after August 31, 1835, within 15 ft. of the centre of the carriageway, and under sec. 65 he can be compelled to lop trees (with certain exceptions) which exclude sun and wind from the highway, or cause an obstruction to the carriageway. But he cannot be compelled to remove or lop trees to which these sections respectively do not apply. (*b*) Whether the bank forms

part of the highway is, I think, a question of fact, similar to the question whether a retaining wall forms part of the highway. The absence or existence of a fence separating the bank from the road, the exercise or lack of exercise by the landowner of acts of ownership, and user or non-user by the public, would be circumstances to be considered in deciding the question. Unless the bank forms part of the highway the council have no power of entry thereon without the consent of the owner.

House Drainage: Combined Drains.—"H. C. W." writes: My council have approved of plans of twelve cottages having separate back-yards, the drains of each house being connected separately with the public



sewer, as per plan A. The owner is desirous, on the ground of economy, to combine the drains of two houses, and make one connection to the sewer, as per plan B. Would my council be in order in approving



the amended plans? I forward copy of building by-laws. Will you also please say what power a local authority have to enforce a separate drain for each house?

The council are not bound to approve the amended plan, but can require a separate drain, communicating directly with the sewer, to be made for each house. See *Woodford Urban District Council* v. *Stark* (66 J.P., 536). Apparently, however, they have power to approve the amended plan if they see fit to do so. If the drains are constructed in the way therein indicated the portions from the points of junction of the separate drains will be "sewers." An agreement might be entered into with the owner that, as between him and the council they shall be considered as "drains," but such an agreement would not be binding on future owners of the houses. See *Butt* v. *Snow* (89 L.T., 302).

Sewer Repair: Damage to Gas Main.—"Drainage" writes: My council opened out an existing sewer for a length of about 200 yds. and 12 ft. deep, pulled out the existing pipes, and laid new ones in their places. While carrying out this work we came across the gas company's main, which was laid on the same line as the sewer only 3 ft. deep. We slung the pipes up with chains, and as we filled the trench up we built piers every 7 ft. or 8 ft.; also I informed the gas company what I was doing, and asked them to inspect the supporting of the pipes. This they did, and the operation was carried out to their satisfaction. After the work had been completed the gas main broke in three places through the settlement of the trench with the traffic passing over. The company have sent in an account for repairs of the same, and I shall be glad if you will say whether my council are liable for these repairs or not.

If the breaking of the gas main was due to negligence on the part of the council's workmen in not properly filling up the trench, the council would be liable for the damage. See *Cox* v. *Paddington Vestry* (64 L.T., 366; *Jacob* v. *Southend Corporation* (*Times*, December 16, 1902).

Building Line.—"Dairy" writes: This is a rural district, one parish has a population of 3,094. In this parish we wish to have a building line, as it is growing very rapidly. Will you kindly inform me how to proceed in the matter?

The powers of local authorities to prescribe a building line are very limited, and apply only to urban authorities, and to such rural authorities as have had urban powers conferred upon them by the Local Government Board under sec. 276 of the Public Health Act, 1875. Under sec. 155 of that Act, when a house has been taken down in order to be rebuilt or altered, the urban authority (or the rural authority, if this power has been conferred upon them) may prescribe the line in which it is to be rebuilt, but they must compensate the owner for any damage. And under sec. 3 of the Public Health (Buildings in Streets) Act, 1888, no building may be erected, without the consent of the authority, beyond the building on either side thereof in the same street. Sec. 155 of the 1875 Act, it will be seen, does not apply to new buildings erected on a site not previously built on. And the Act of 1888 is defective to this extent—that there is no control over the first building in the street, which may thus fix the line for the other buildings. And no by-law can be made giving the authority power to fix a building line (*Robinson* v. *Barton Eccles Local Board*, 48 J.P., 276). I presume that a scheme under the Housing and Town Planning Act, 1909, might contain provisions as to a building line, although, curiously enough, this is not one of the matters specifically mentioned in the fourth schedule to the Act, unless it can be deemed to be included in the item "buildings, structures, and erections." But this schedule is not exhaustive.

Water Supply: Supply by Meter.—"S. and E." write: We shall be glad if you will kindly let us know whether consumers of water in the Metropolitan area have the right to demand that they shall be charged for their water on the basis of measurements by meter or whether they are bound to pay on the basis of the rateable value of the premises. The particular place we have in mind is a large drapery store, and any information you can give us will be much appreciated.

The rights of consumers of water in the Metropolitan area depend upon the provisions of the special Act applicable to the particular district. In every district the charges for a supply for "domestic purposes" are based upon rateable value, and in none can a supply by meter for "domestic purposes" be insisted on. As regards water for other than domestic purposes, in some districts a consumer can require a supply for other than "domestic purposes" by meter; in others such supply can only be required upon such terms and conditions as may be agreed upon between the consumer and the Water Board. Where the use of water is in its nature domestic, the supply is for "domestic purposes," notwithstanding that its use may be ancillary to the carrying on of a business, or that the existence of a business may necessitate an increased supply for domestic purposes. See *Metropolitan Water Board* v. *Avery* (29 T.L.R., 713).

Kesteven County Council's New Offices.—It was stated at a meeting of the Kesteven County Council on Wednesday that a site for the council's new offices in Sleaford market place had been purchased for £1,925.

Refuse Disposal at Maldens and Coombe.—Tomorrow (Saturday) is fixed for the digging of the first sod in connection with a refuse destructor which is to be erected on a site adjoining the Maldens and Coombe sewage pumping station. The contractors are Messrs. Heenan & Froude, Limited.

Road Improvement for Military Traffic. It was announced at the meeting of the Kesteven County Council on Wednesday that the War Office desired that 2½ miles of the Bridge End-road should be placed in a condition to carry heavy guns on their way to and from the coast. The cost—£1,200 per mile—would not fall on the county council, and after the road was passed as satisfactory, the owners of the adjoining estates would have to pay £30 per mile per annum in perpetuity for the upkeep and maintenance of the road. It was resolved that the necessary authority be given to the sub-committee to complete the negotiations.

Water Divining in East Suffolk.—The Health Committee of the Bosmere and Claydon [illegible] Rural District Council recently had before them specifications for the construction of wells in connection with proposed supplies of water to Barking Tye and Creeting Bottoms, and it was resolved to recommend the employment at a fee of two guineas per day, of a water diviner to inspect the areas with a view to ascertaining the points at which water was most easily obtainable by sinking. It was further recommended that the gentleman to be engaged should be directed to make tests for water at Mockbeggar Green and Earl Stonham. After discussion of the recommendations the council has deferred the matter to allow the clerk to have an interview with the diviner.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Bollington U.D.C. (March 8th. Mr. R. H. Bickerton.)—£8,650 for works of paving in Henbank-road, Grimshawlane, Water-street and Palmerston-street. After considering the proposals the inspector said: I have heard [illegible] I propose to recommend sanction for the loan, and I think you will get it as soon as the Treasury will allow the Local Government Board to let you have the money. When that is [illegible] you must write to me at once, as after that I cannot tell what I may [illegible] the proposed [illegible] are not really done now, but necessary to bring [illegible] insanitary, the county council might do something to [illegible] I will personally write to the county surveyor and ask him to do what he can for you."

Hendon U.D.C. (March 10th. Mr. A. G. Drury).—£1,400 for works of [illegible] and £175 for the erection of a public convenience.—The engineer, Mr. S. S. Grimley, stated that the proposed convenience would be near a rifle range now under construction. No loan was sought for the range. The inspector: Why did you not pay for this convenience out of revenue? The surveyor: This building is of rather different construction to the rifle range. With respect to the proposed reconstruction of a portion of the outfall sewer, the clerk, Mr. H. Humphries, said that by arrangement with the Ecclesiastical Commissioners a new road leading out of Cricklewood-lane would be constructed, but before the works were commenced the council were advised that, having regard to the condition of the old sewer under the site of the new road, it would be wise to [illegible] a portion. The existing sewer was laid nearly forty years ago. There was a great urgency for the work, as the road it was proposed to construct formed the approach road to the artizans' dwellings, which were nearing completion. The surveyor: The sewer has practically done its bit. I should not be surprised [illegible] one or two places.

Hucknall U.D.C. (March 16th. Mr. M. K. North). £3,427 for laying out Titchfield Park, and [illegible] a caretaker's house, pavilion, and bandstand.—The park, it was stated, was a gift to the council by the Duke of Portland. Evidence with respect to the scheme was given by Mr. Parr, architect, and Mr. Bardell, florist.

Seaford U.D.C. (March 23rd. Mr. W. M. Cross).—£1,601 for works of sewerage and sewage disposal.—The War Office, it was explained, would make a contribution of £650 towards the cost of the scheme. The tender of Messrs. Godfrey Bros., Seaford, at £1,296, has been accepted for the work.

Southampton T.C. (March 11th. Mr. W. O. E. Meade-King). £1,700 for widening and improving Welbeck-avenue.—The borough surveyor, Mr. J. A. Crowther, stated that the road was an exceedingly dangerous one, and one not safe for anyone to drive over. He was of the opinion that it should be made up at once or at least as soon as possible.

Waterloo U.D.C. (March 18th. Mr. Edgar Dudley). £598 for the purchase of property for the widening of Crosby-road North, Waterloo, and £7,344 for street improvement in Seaforth-road, Seaforth.—With regard to Seaforth-road, it was stated the loan was required for street works, building sites being now cleared. It was only a matter of time before the council asked that it should be taken over as a main road.

Wincanton R.D.C. (March 11th. Mr. W. O. E. Meade-King). £1,900 for works of water supply for the parish of Shepton Montague.—Mr. E. J. H. Padfield, surveyor and inspector, testified that there was great need for an improved water supply. It was stated that it was proposed to provide for a daily allowance for each person of 15 gallons.

APPLICATIONS FOR LOANS.

Aldershot U.D.C. £736 for the erection of four cottages.

Chorley R.D.C.—£250 for laying water mains.

Congleton T.C.—£250 for sewer extension.

Darlington T.C.—£1,300 for electricity mains and services.

East Barnet U.D.C. £2,355 for making up a street.

Evesham Joint Hospital Board.—£1,000 for additions to the sanatorium.

Hayes U.D.C.—£350 for sewerage works.

Horsham R.D.C.—£3,500 for a joint hospital scheme.

Hull T.C.—£20,000 for the electricity works.

Mansfield T.C.—£1,100 for the purchase of property for street improvement.

Mirfield U.D.C.—£2,226 for street improvement.

Norwich T.C.—£400 for works at the tuberculosis dispensary.

Paignton U.D.C.—£820 for the purchase of land and the erection of unclimbable fencing.

Sherborne U.D.C.—£5,000 for the purchase of land for the erection of working-class houses.

Southend T.C.—£6,002 for making up certain roads.

Tettenhall U.D.C.—£660 for the purchase of property for road improvement.

Wrexham T.C.—£6,056 for the erection of cottages, and £4,500 for slaughterhouses.

LOANS SANCTIONED.

Bentley-with-Arksey U.D.C.—£2,640 for a housing scheme.

Blackrock U.D.C.—£1,550 for asphalt paving work, and £[illegible] for sewerage work.

Colwyn Bay U.D.C.—£250 for cemetery extension.

Hoddesdon U.D.C.—£990 for cemetery extension.

Hull T.C. £2,275 for completed [illegible] extension.

Skibbereen U.D.C.—£350 for labourers' cottages.

Southend T.C.—£2,675 for a recreation ground, an electricity sub-station, and street improvement.

The Treasury and Public Loans.—Recently the Lords Commissioners of the Treasury declined to sanction a loan for street widenings at Coventry. On Wednesday they intimated to the Education Committee that they were unable to approve the raising of loans for the enlargement of two schools. Another scheme on hand is the building of a technical institute. The City Council Committee decided to ask the Treasury to receive a deputation on the subject to hear reasons why sanctions to loans for these works should not be withheld.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below:—Buildings—Barnsley, Devon, Dundee, Horsham, Manchester, Swansea; housing and town planning—Liverpool; roads and materials—Devon, Hexham; sewerage and sewage disposal—Knaresborough, Stoke-on-Trent; water, gas and electricity—Darlington.—Particulars of other projected works will be found in our "Local Government Board Inquiries" price.

BUILDINGS.

Barnsley T.C.—Tenders aggregating £22,465 have been accepted for the erection of a new town hall and municipal offices on a site in Church-street.

Bournemouth T.C.—Negotiations are in progress for the purchase of a site for a secondary school for girls.

Bradford T.C.—Subject to the approval of the Local Government Board, a scheme has been passed by the Health Committee for the erection of a small-pox hospital.

Chelmsford T.C.—The Education Committee proposes to build a school at South Primrose Hill.

Devon C.C.—It is proposed to spend £10,000 on a proposed technical school for Barnstaple, £10,000 for a similar purpose at Torquay, £2,200 for a small-pox hospital (in substitution for the £1,000 approved in December), and £17,500 on the proposed institution for the care of the mentally defective.

Dundee T.C.—The central improvement scheme, embracing the erection of a city hall, came before the council last week, when a resolution was passed in favour of the promotion of a Provisional Order for a loan of £100,000 to build wings of business premises on the ground now being cleared under the Improvement Act. To objections raised in regard to incurring capital expenditure at the present time, the town clerk said they would be safeguarded by the Treasury arrangement providing that there should be no fresh capital expenditure during the war and for a year afterwards, and his opinion was that they would only get the powers needed if the scheme was prosecuted as a whole.

Horsham R.D.C.—It has been agreed to join the urban district council in the provision of an isolation hospital, at an estimated cost to the rural council of £3,500.

Isle of Wight C.C.—An agreement has been reached to purchase the premises and site of the Swan Hotel, Newport, for £1,400, for the purpose of county offices.

Manchester T.C.—The Baths Committee have again discussed the proposed scheme for public wash-houses referred back by the city council at its last meeting. In view of the fact that the Treasury will not sanction loans for increased capital expenditure, the committee was unable to take any further action for the time being.—It is proposed to build industrial schools at Cheadle Hulme, at an estimated cost of £38,000.

Rowley Regis U.D.C.—A tender, at £1,459, has been accepted for the erection of a technical school at Old Hill.

Saxmundham U.D.C.—The Local Government Board having refused to sanction a loan for the purchase and adaptation of premises for fire brigade purposes, the council have decided to purchase the property and carry out the necessary work at the cost of the general rate.

Sedgley U.D.C.—The surveyor, Mr. F. W. Farton, has been instructed to proceed with the scheme for the erection of a mortuary.

Stirling T.C.—The burgh surveyor, Mr. A. H. Goudie, has prepared plans for a public convenience in Torbrex-lane.

Surrey C.C.—Tenders have been accepted for the erection of dispensaries at Richmond, Horley and Epsom.

Swansea T.C.—Extensions are to be carried out at the technical college at an estimated cost of £22,000.

Wilts C.C.—The Public Health Committee have approved of plans for the extension of the Calne isolation hospital, at an estimated cost of £200.

Woking U.D.C.—It has been agreed to subscribe one-sixth part of the estimated cost (£3,100) for the reconstruction of Hermitage Bridge, on the direct road between Woking and Aldershot. The plans of the structure have been prepared by the surveyor, Mr. G. J. Wooldridge.

HOUSING AND TOWN PLANNING.

Camborne U.D.C.—The proposed housing scheme has been abandoned until after the war.

Congleton T.C.—The borough surveyor, Mr. J. H. Walters, has received instructions to prepare a scheme for the erection of twenty working-class houses.

Foleshill R.D.C.—It is proposed to build working-class dwellings at Foleshill and Bedworth.

Liverpool T.C.—The Housing Committee have received from Mr. Henry Hartley, the assessor, his awards on the competitive designs sent in anonymously for the workmen's dwellings proposed to be erected by the corporation in the Rathbone-street area. The second competitor out of a very long list proves to be an official in the service of the town council: First prize (£100), Messrs. Biram & Fletcher, architects, St. Helens; second prize (£50), Mr. F. E. D. Badger, Carlton-lane, Stoneycroft (Mr. Badger is the deputy building surveyor to the corporation); third prize (£25), Messrs. Halliday & Paterson and Mr. C. Gustav Agate, joint architects, Manchester. The assessor stated that his task was difficult, owing to the high standard of merit of many of the designs.

Saffron Walden R.D.C.—Application is to be made for compulsory powers for the purchase of land for the erection of working-class houses.

Neath T.C.—The council have received sanction from the Local Government Board for the preparation of town planning schemes.

Northwood-Ruislip U.D.C.—A site is to be purchased at Ruislip Common for the erection of cottages.

ROADS AND MATERIALS.

Ayrshire C.C.—After considering a report on the matter by Mr. McDonald, road surveyor, the Northern District Committee have sanctioned a grant for a road improvement on Bankhead-road, Dalry. The part of the road involved is near East Middlebank, which is very steep, and it is proposed to improve the gradient by cutting and embanking.

Brentford U.D.C.—The council have adopted a report of the Works Committee upon a conference with the Middlesex County Council with respect to the sewers under the new Great West-road. The committee stated that, after considering all the arguments raised, they could not advise the council to depart from its resolution of January last. They thought that the council should not be called upon to contribute towards the cost of making the new road, because the county council could raise loans much easier and cheaper than the council could. They pointed out that there would be a loss to the rates from the loss of the assessments of property that would be pulled down on the line of the new road, and they further recommended that the county council be asked to postpone the construction of the new road until after the termination of the war.

Bridgwater T.C.—The council have informed the county council that they approve the scheme of the proposed new road at Wembdon, but consider that their (the town council's) contribution should be considerably less than one-third of the balance, estimated at £3,515, and that the work should not be executed until after the termination of the war.

Brighton T.C.—It has been agreed to pay £1,120 for the purchase of 14 Pavilion-parade for the purpose of street improvement.

Chesterfield R.D.C.—It was reported that the final apportionment in connection with the making up of Pitt-street, Eckington, showed the total cost to be £408, of which £47 was payable by the council and £361 by the owner. In the provisional apportionment it was estimated that the work would cost £368, and that the amount payable by the council for sewering would be £35. The lowest tender for the work was £100 more than the estimate, so £60 had been saved by doing the work by direct labour.

Chester-le-Street R.D.C.—The surveyor, Mr. G. W. Ayton, proposes to commence the laying down of tarred macadam on the bus routes as soon as the weather permits.

Chippenham R.D.C.—Upon the recommendation of the surveyor, Mr. A. H. Lapham, the tender of the Cardiff Gas Company, at 46s. per ton, has been accepted for the supply of tar for the roads.

Cork T.C.—The Road Board have sanctioned a grant of £1,000 for works of road improvement.

Devon C.C.—The Main Roads Committee recommend the purchase of one steam traction engine on stone crusher and one living van, at a total cost of £880, for work on the main roads in Division 1; and two steam traction engines and four trailer wagons at a total cost of £1,200 for work on the Exeter-Okehampton main road. They further recommend an expenditure of £4,500 for main road tar-spraying.

Egham U.D.C.—It is proposed to lay new granite kerbing in Station-road.

Exeter T.C.—The tender of Mr. W. R. Bradley, St. Thomas, Exeter, at £3,236, has been accepted for the improvement of Haven-road and Water-lane.

Glamorgan C.C.—A letter from the Local Government Board with reference to the grants by the Road Board stated that it was proposed to give grants for improvements immediately required. The grants would be on a considerably reduced scale, and would be granted only in cases of roads the improvement of which could not properly be postponed. The counties should maintain the military roads in good condition, but they should spend no more than was absolutely necessary. No applications for grants for widening, diversions, new roads, and reconstruction of bridges could be considered just at present, but these should be sent forward for consideration so that the Road Board might fully consider them when they would be in a position to make the ordinary grants. County councils should not spend more than was absolutely necessary at present. The council authorised the Roads and Bridges Committee to carry out the work that is absolutely necessary.

Hexham R.D.C.—The principal footpaths in the Wylam district are to be treated with asphalt.

Kensington B.C.—At a special meeting of the council it was decided to reduce the expenditure on the maintenance and repair of the highways by £5,000 and the refuse collection by £700, during the ensuing year, so as to avoid the employment, as much as possible, of able-bodied men fit for service, and to encourage recruiting.

Kingston (Surrey) T.C.—The tender of Messrs. Stickley was on Tuesday accepted for horse hire for the ensuing year, at 10s. per day, or 6s. per half-day, for horse, harness and driver; 300 tons of granite have been purchased at 15s. 9d. per ton, and tenders have been invited for 1,700 tons.

Mytholmroyd U.D.C.—It was announced at the council meeting recently that two owners had signified their willingness to give land necessary for the widening of a section of the Burnley main road, and that there was every confidence that a third would also make a similar gift.

Paignton U.D.C.—It has been decided, subject to the consent of the Local Government Board, to purchase land at Roundham Head for the purpose of a footpath, to build a wall, and erect an unclimbable fence, at an estimated cost of £700.

Staffs C.C.—The county surveyor, Mr. J. Mouncy, and Sir Reginald Hardy have had an interview with the Road Board with regard to the proposed road widenings, improvements of the county main roads, and the applications of urban and rural authorities for grants in respect of road widenings and improvements. After considering the report submitted by them to the Main Roads and Bridges Committee, the council have decided that, inasmuch as there was not sufficient unemployment to render it necessary to put men on the roads for the sake of finding them something to do, and thus earning grants from the Road Board, it would be advisable that all the proposals, with the exception of those relating to the purchase of road materials, should remain in abeyance.

Watford U.D.C.—The council have approved the suggestion of the surveyor, Mr. D. Waterhouse, to relay Market-street with Tarmac, at an estimated cost of £500.

Winchester R.D.C.—In response to his application the surveyor, Mr. G. E. Carter, has received an intimation from the Road Board that they have sanctioned a grant of £100 for the surface tarring of the district roads. Military requisitions have been received for the repair of the roads leading to the training camps.

SEWERAGE AND SEWAGE DISPOSAL.

Clutton R.D.C.—Consideration is being given to a scheme of sewerage for Rotcombe, the estimated cost of which is £300.

Colwyn Bay U.D.C.—The Local Government Board have intimated that, while they approve (with certain minor amendments) of the proposed sewerage scheme, they consider it should be deferred for the present. The estimated cost of the works is £11,000.

Knaresborough R.D.C.—It is proposed to carry out sewerage extensions at Starbeck.

Stoke-on-Trent T.C.—The council have adopted a proposal of the Sewage Disposal Committee to acquire a new site, construct a new outfall sewer, and provide new sewage disposal works at Strongford, near Tittensor.

Thorpe R.D.C.—The council are giving consideration to a scheme for the drainage of the district.

Wellington U.D.C.—The Local Government Board in a letter to the council stated that they had considered the report of the inspector who held an inquiry recently respecting an application for a loan by Wellington Council of £9,025 for sewerage and sewage disposal. The board understood that it was proposed to purchase 6a. 2r. 8p. of land at £135 an acre, and that only a small portion of the land would be required for the scheme. They could not assent to that course. If the scheme was to be sanctioned it would be on the understanding that the surplus land would be vended by the council. A resolution was carried to the effect that a reply be sent to the board that the council would be prepared to offer for resale the land that was not required.

WATER, GAS, AND ELECTRICITY.

Brighton T.C.—It has been decided to renew the tubes at the condenser at No. 2 turbine at the South-work power station at an estimated cost of £500, less the amount to be received by the sale of the old tubes.

Darlington T.C.—It is proposed to instal new plant at the electricity works, at an estimated cost of £18,550.

Kingston (Surrey) T.C.—The following alterations have been made in the charges for electricity: The flat rate of 5d. per unit is increased to 5½d.; that supplied on the indicator system at 7d. and 3d. is increased to 7½d. and 3½d.; the supply to churches is increased from 4d. to 5d.; and 10 per cent is added for public electric lamps. No alteration is made in the charge of 1½d. for heating, cooking, and fixed motors.

Kinross T.C.—A proposal has been approved for the purchase of the local gas undertaking.

Llandilo R.D.C.—It is proposed to provide water supplies for Milo and Carmel.

Mytholmroyd U.D.C.—At the Waterworks Committee, the surveyor, Mr. S. Sutcliffe, submitted the cost of the water used by the several departments of the council. After considering this, it was resolved that the various departments of the council, in preparing their estimates for the coming year, should include in such an amount equal to the value of the water likely to be used by them. Councillor Harrison, commenting on this, said it was a new departure for each department to have to pay for its own water, yet he considered it only fair that all departments should bear their share of the burden. By adopting that system the waterworks department would show a profit of about £50.

Okehampton T.C.—A letter was read last week from the Local Government Board stating that they had considered the report made by their inspector, Mr. W. O. E. Meade-King, with reference to the council's application for sanction to borrow £106 for works of water supply in Park-row and East-street. The board gathered that all the works had been completed for some time, and, having regard to the necessity for avoiding, as far as possible at present, the borrowing of money by local authorities, they did not see how they could sanction the loan. The town clerk, Mr. J. J. Newcombe, thought he should be authorised to ask the board to alter its decision. The work was in connection with working-men's dwellings which were to be erected. The suggestion of the town clerk was agreed to.

Perth T.C.—In view of the circular issued by the Treasury as to municipal expenditure and the floating

of loans during the present crisis, it is understood that the scheme for a new water supply to Perth is to be postponed. Two of the city officials had an interview with Mr. Hogge, the engineer, at Glasgow recently in connection with the probable cost of the Stormontfield scheme.

PERSONAL.

Mr. W. B. Purser, county surveyor of Kesteven, has had his salary increased from £400 to £475 a year.

Mr. Frank W. Pownder, highways surveyor to the Watford Urban District Council, has been appointed to a position at Oxford.

Mr. G. M. Seels, New Malden, has been appointed temporary assistant in the county surveyor's department (South District), Dorset County Council.

Mr. P. C. Beeston, of Hemel Hempstead, has been appointed temporary assistant in the surveyor's department, Romford Rural District Council, at a salary of £120.

Mr. J. A. Angell, surveyor to the Beckenham Urban District Council, has received a letter of sympathy from the members of the council upon the death of his wife.

Mr. Patrick Hanrahan, borough surveyor of Wexford, and Mr. John Haworth, F.C.S., sewage disposal works, Wincobank, Sheffield, have been elected members of the Royal Sanitary Institute.

Mr. E. H. Tabor, assistant district engineer in the chief engineer's department of the London County Council, has been promoted to the position of assistant engineer at a salary of £800, rising by annual increments of £50 to £1,000 a year. The appointment follows the retirement of Mr. J. E. Worth, the assistant engineer in charge of the main drainage system on the north side of the Thames, and the council have taken the opportunity of giving effect to an arrangement approved in December, 1913, by which one officer will be responsible to the chief engineer for the effective maintenance of the whole of the main drainage system, and the supervision and design of any new main drainage works.

Mr. E. H. Habgood, acting county surveyor of Dorset, received honourable mention at the meeting of the county council recently, when Colonel Gooden, in submitting the report of the Works Committee, referred to the exceptional difficulties with respect to the abnormal rainfall, the shortage of labour, and the great scarcity of material that had to be faced in dealing with the county work. The acting county surveyor, he stated, had grappled with the difficulties in the ablest possible manner. The deputy surveyors in the north and south had been laid aside by illness, and a great deal extra work had been thrown upon the acting surveyor, and he had carried out their duties as well as his own. With respect to the remuneration of Mr. Habgood, the council decided that, as from August 1, 1914, at which date Mr. W. T. Fletcher, the county surveyor, was called up on military service, he should be paid a salary at the rate of £200 per annum, and during the continuance of the present arrangements a bonus salary at the rate of £200 per annum.

The death is announced of Mrs. Wyrill, wife of Mr. R. H. Wyrill, the borough engineer of Swansea. Mr. Wyrill, to whom we tender our deepest sympathy, has four sons, three of whom are serving with the Colours.

The final selection of the "man of push and go" to superintend the works and factories which are to come under Government control had not been announced when we went to press last night, but rumour has it that Sir George Gibb, who, it will be recollected, recently joined the Army Council with a special view to the supervision of Army contracts, will be chosen to fill the position.

FOR OTHER ADVERTISEMENTS
See End of Paper.

ROAD-MAKER. Energetic and experienced Working Engineer, familiar with tar-macadam work and tar surface treatment, required by important firm commencing road construction. State age, qualifications, experience and salary, to Box No. 1,515, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (2,511)

THAME URBAN DISTRICT COUNCIL.

The Council require the Services of a thoroughly competent Man to take charge of the Pumping Machinery at the Waterworks.

He must have a practical knowledge of the working of Oil Engines, Tapping of Water Mains under pressure, Detection of Waste, Inspection of Fittings, and be able to do small repairs.

Preference will be given to candidates having had similar experience under a Public Waterworks Authority.

Wages 32s. per week. Further particulars may be obtained from the Council's Surveyor, Mr. James T. Robinson, Town Hall, Thame.

Applications, accompanied by not more than three testimonials (copies only) as to character and ability, must be delivered to me not later than the first post on Wednesday, the 31st day of March inst.

CHAS. SIMMONS.
Clerk to the Council.

2 High-street, Thame.
March 22, 1915. (2,508)

ALTON URBAN DISTRICT COUNCIL.

Tenders are invited for the supply of Tarred Slag and Clee Hill Basalt. Forms of Tender may be obtained from the undersigned, and when completed to be returned in sealed envelope, endorsed "Granite," to Mr. Bradley Trimmer, Clerk to the Council, not later than April 10th. The Council do not bind themselves to accept the lowest or any Tender.

G. BERTRAM HARTFREE, F.S.I.,
Surveyor.

Town Hall,
Alton,
Hants.
March 24, 1915. (2,509)

THE SHILDON URBAN DISTRICT COUNCIL desire Tenders for the Supply of the undermentioned Materials during the year ending 31st March, 1916:—

Broken Whinstone, Slag, and Tarred Whin and Slag, from 2½ in. to fine; Concrete and Freestone Kerbs, Sweeps and Flags; Cement, Sand, Scoriæ and Paving Bricks, Sanitary Pipes, &c.; Disinfectants, Brooms, Shovels, Spades, C.I. Gullies and Manhole Covers, to be delivered at Shildon Station.

Sealed Tenders, with Specifications and Samples, to be received by 6th April.

J. ARTHUR WOOD,
Clerk.

Council Offices,
Shildon. (2,510)

BOROUGH OF HYTHE.
ISOLATION HOSPITAL.

The Corporation of Hythe are prepared to receive Tenders for the erecting of a Timber-framed and Corrugated-iron Isolation Hospital for eight beds.

Plans and Specifications can be seen, and Form of Tender obtained, on application to the undersigned.

Sealed Tenders, endorsed "Isolation Hospital," to be delivered to Bernard C. Drake, Esq., Town Clerk, Hythe, Kent, on or before 12 noon, Friday, 9th April, 1915. The lowest Tender will not necessarily be accepted.

CHRIS. JONES, C.E.,
Borough Surveyor.

Borough Surveyor's Office,
Hythe, Kent.
March 24, 1915. (2,506)

MALDON RURAL DISTRICT COUNCIL.
HIRE OF STEAM ROLLERS.

The above Council invite Tenders for Steam Rolling for the year ending June 30th, 1916.

Specification and Form of Tender may be obtained from the Surveyor.

Sealed Tenders, endorsed "Tender for Steam Rolling," must be delivered at my Office not later than Tuesday, March 30th, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

E. J. ENNALS,
Surveyor.

6 Market-hill, Maldon, Essex. (2,507)

LONDON WATER.

EQUALISATION OF STORAGE IN THE THAMES VALLEY.

In a report presented at last Friday's meeting of the Metropolitan Water Board the Water Examination Committee stated that they had given careful consideration to the alterations in the design of the Littleton reservoirs which the Works and Stores Committee are submitting to the board. The scheme involves the construction of earthen embankments with submerged slopes formed of specially prepared puddle plated, and the substitution of earthen dividing banks for the purpose of ensuring that the whole body of water is placed in motion between the inlet and outlet who never water is withdrawn.

"The original scheme," said the committee, "had several important drawbacks which cannot be overlooked. There is compensation to be provided with separate inlets and outlets, a matter to which the Director of Water Examination attached great importance, since with reservoirs of enormous size the difficulties of treatment are greatly increased if anything goes wrong. The submerged dividing embankments in the original plans were partially designed by the late Mr. Bryan with the idea of ensuring good circulation of water and the deposit of silt, and they would have effected these objects. It appears, however, that the deposition of silt in moving water is not a method which should be followed in ordinary circumstances, as it leads to the drawing out of many impurities which, under the newly proposed, settle at the bottom of the reservoir and become partially disintegrated and purified.

"The new proposals have many obvious advantages. Good circulation is obtained by a skilful arrangement of training banks, and this part of the scheme appears to be extremely satisfactory on the understanding that the upper portions of these banks are covered with concrete aprons. The total storage accommodation is also considerably increased by the omission of the central embankment, while the abstraction of foul water is prevented by the provision of an outlet tower allowing of water being drawn at any level above the sill.

Against these real advantages, however, the committee pointed out, must be set the fact that the subdivision into four reservoirs of the alternative of two positions with a central embankment originally advocated by them, were according to the present proposal reduced to one reservoir of enormous capacity with no special provision for preliminary sedimentation, and in the event of algal troubles arising it would be extremely difficult to treat so huge a volume of water. They had viewed with some apprehension the proposal for the omission of the central embankment, but, as the Works and Stores Committee had—(1) incorporated in the scheme suggestions for stopping the bottom of the reservoir so as to expose it to drying out in winter where practicable, the excavating to be as impossible, the preliminary removal of excessive growth of vegetation, (2) had agreed to afford every possible consideration to a suitable scheme for dealing with the intercepted water which it was hoped would enable them to bring forward, and (3) had favourably received a suggestion for superseding the storage in the Thames Valley, they, the Water Examination Committee, did not feel justified in pressing for the retention of the central embankment. It might be very right to state that, in the opinion of the Director of Water Examination, small sedimentation reservoirs should be interposed between the river and the large storage reservoirs, and that undue large reservoirs were to be avoided.

The Director of Water Examination had always advocated that equality of storage was most important, and in his judgment provision against drought did not necessarily involve the retention of water for unequal periods in the different reservoirs. The equalisation of storage was a matter which the committee regarded as being of cardinal importance, and they had taken advantage of the opportunity afforded by the consideration of this scheme to ask the Works and Stores Committee for an assurance that when the Littleton works had been brought into use arrangements would be made by which the water in both the Staines and Littleton reservoirs would not be subjected to a substantially longer period of storage than the average period throughout the Thames system of supply. They realised that it was essential to ensure adequate provision against periods of drought, and that times might arise when [illegible] there were certain engineering difficulties in connection with the Thames Valley works as at present designed, which rendered equalisation in these exceptional circumstances impracticable. Nevertheless, they believed that, exceptional cases apart, it was possible [illegible] the power of equalisation, and the Water and Stores Committee and the chief engineer were in broad agreement with them.

SEWAGE AERATION EXPERIMENTS IN THE UNITED STATES.

The United States Health Service and the Baltimore Sewerage Commission have completed preliminary plans for conducting jointly at Baltimore a series of experiments on the aeration of sewage. Prof. Earl B. Phelps will direct the work for the Health Service, with Mr. Leslie C. Frank in charge of the experimental plant, while the Baltimore Sewerage Commission will be represented by its chief engineer Mr. Colin W. Hastings. From Prof. Phelps and Mr. Hastings the following information regarding the scope of the work has been received by the *Engineering Record*.

Recent English results on the aeration of sewage seem to support the work which Col. William M. Black and Prof. Phelps did at Brooklyn some years ago, and to explain some irregularities which interfered with complete success. It is proposed, therefore, to co-operate those earlier experiments, making use of the activated sludge principle developed by the English workers.

One of the two tested tanks at the Baltimore works will be equally provided, so that it can be used to test the effect of aeration upon a practicable scale and to make experiments how process which is essential if practical use is to be made of the English principle.

INSTITUTION OF WATER ENGINEERS.

[illegible] at the Institution, 25, Victoria-street, Westminster, on Wednesday, the 12th inst., Messrs. J. B. Hill, R.N., geological adviser to the Local Government Board; H. H. Law, M.INST.C.E., chief engineering inspector to the Local Government Board; and P. C. Cowan, D.SC., M.INST.C.E., chief engineering inspector to the Local Government Board of Ireland.

The council also elected Mr. W. A. Walker, engineer and manager to the Hillhouse and Hamilton Water Company, as member, and Mr. G. A. Ballard, assistant borough engineer, Guildford, as associate-member.

[illegible]

The council, in view of the probability that the [illegible] at the Belfast meeting arranged for June 15th-18th next would be prejudicially affected by the war, have decided to postpone it until the summer of 1916.

A meeting will be held in London on Friday, June 18th next, for the purpose of installing the president-elect and the reading and discussion of papers, particulars of which will be announced later.

The nomination and election of officers will be [illegible] this year.

It is suggested that Mr. McCullough should be [illegible] to the presidential chair a second year, in which case his presidential address would be delivered at the Belfast meeting in June.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purposes, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

COUNCIL MEETING.

A meeting of the council of the institution was held at 92 Victoria-street, Westminster, S.W., on Saturday, March 13th, when there were present Messrs. J. S. Pickering (president, in the chair), J. Patten Barber, W. Nisbet Blair, J. A. Brodie, G. F. Carter, J. W. Cockrill, A. E. Collins, E. J. Elford, Frank Harris, T. W. A. Hayward, W. T. Lancashire, L. S. McKenzie, P. H. Palmer, W. H. Prescott, Norman Scorgie, R. J. Thomas, H. T. Wakelam, O. E. Winter, the consultant secretary, and the secretary.

THE MEMBERSHIP ROLL.

The following candidates were elected.

Members: Messrs. W. Ellis, engineer and surveyor to the Barnoldswick Urban District Council; H. Knight, deputy surveyor to the Brentford Urban District Council; N. E. Naish, chief assistant, sewerage department, Croydon Corporation; and J. P. Pike, divisional engineer to the Port Elizabeth Municipality.

Students: Messrs. H. H. Green, engineering assistant to borough surveyor, Eccles; J. Hawcroft, articled pupil to engineer and surveyor, Hoyland Nether Urban District Council; F. Cross, articled pupil to surveyor to the Northwich Urban District Council; and H. Garside, junior assistant to the Leek Urban District Council.

Transfer from Associate-member to Member: Mr. R. B. Donald, chief engineering assistant to borough engineer and surveyor, Huddersfield.

The matter of appointments on the staffs of local authorities falling vacant during the war was considered by the council, and it was resolved to suggest to the Local Government Board that they should advise authorities to fill such posts temporarily, it being recognised that otherwise officers on active service will be in a less favourable position as regards promotion and advancement than if they had not offered their services to the Crown.

COUNCIL BALLOT.

Upon the report of the returning officer and scrutineers as to the scrutiny of the ballot lists for the election of the president, vice-presidents, honorary treasurer, and ordinary members of the council, the following were found to be elected for the year 1915-1916:—

President: Mr. H. T. Wakelam.

Vice-presidents: Messrs. J. S. Brodie, T. W. A. Hayward, and P. H. Palmer.

Honorary Treasurer: Sir James Lemon.

Ordinary Members of Council: Messrs. Chas. Brownridge. E. E. W. Butt, G. F. Carter, E. J. Elford, H. P. Foster, W. T. Lancashire, E. B. Martin, F. Massie, W. H. Prescott, Norman Scorgie, H. E. Stilgoe, and C. F. Wike.

District nomination forms will be issued before the end of March.

SOUTH-EASTERN DISTRICT.

A South-Eastern District meeting is to be held at the offices of the institution, 92 Victoria-street, Westminster, S.W., to-day (Friday), at 6 p.m.

AGENDA.

(*a*) To confirm minutes of last meeting.
(*b*) To consider nominations for—
(1) District chairman.
(2) District representative.
(3) District secretary.
(*c*) To elect district executive committee.
(*d*) Any other business.

H. W. Bowen, Assoc.M.Inst.C.E.,
Hon. District Secretary.

Horsham.

SOUTH-WESTERN DISTRICT.

A South-Western District meeting will be held at the Municipal Buildings, Taunton, to-morrow (Saturday).

PROGRAMME.

12 noon.—Meet at the Council Chamber, Municipal Buildings, Taunton.
Business:—
To confirm minutes of the last meeting.
To receive communications, if any.
To decide as to nominations for district officers.
To elect a district executive committee.

1 p.m.—Lunch at the Municipal Hall, by kind invitation of his Worship the Mayor of Taunton, Councillor Geo. Hinton, J.P.

2.30 p.m. Discussion on public baths, to be opened by Mr. D. Edwards, Assoc.M.Inst.C.E., borough surveyor, Taunton.

4 p.m. Tea at the Municipal Hall, by the kind invitation of Alderman F. W. Penny, J.P., deputy mayor of Taunton.

D. Edwards, Assoc.M.Inst.C.E.,
Hon. District Secretary.

Taunton.

SOUTH WALES DISTRICT.

A South Wales District meeting will be held at City Hall, Cardiff (by the kind consent of the Cardiff Corporation), to-morrow (Saturday), at 2.15 p.m.

AGENDA.

(1) To read the minutes of the last meeting.
(2) To elect a district secretary.
(3) To receive nominations for district representative.
(4) To elect a district chairman.
(5) To elect a district executive committee.
(6) Paper by Mr. D. M. Jenkins (member), Neath: "Notes on Extraordinary Traffic on Highways."
(7) Other business, if any.

H. Alex. Clarke,
Hon. District Secretary.

Briton Ferry.

EAST MIDLAND DISTRICT.

An East Midland District meeting is to be held at the Town Hall, Loughborough, on Saturday, April 10th.

PROGRAMME.

2.15 p.m.—The members and visitors will be received in the Council Chamber by the Mayor of Loughborough (Mr. W. W. Coltman, J.P.).

2.30 p.m.—To receive minutes of last meeting.
To elect district committee.
To discuss election of district representative, district chairman, and district secretary.
To consider any other general district business.

3 p.m.—Proceed in conveyances (at a charge of 1s. per person) to inspect the swimming baths, where members will be given the opportunity of inspecting an apparatus for teaching swimming, erected by Messrs. Herbert Morris, Limited, of Loughborough.
Proceed to sewage farm to inspect refuse destructor and other works.

5 p.m.—Arrive at town hall, where tea will be provided by the borough surveyor, Mr. A. H. Walker, Assoc.M.Inst.C.E.

E. H. Crump, Assoc.M.Inst.C.E.,
Hon. District Secretary.

Hinckley.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Tuesday, April 13th, at the Institution of Electrical Engineers, Victoria Embankment, W.C., a paper, entitled "Main Roads: Past and Present, and Modern Methods of Construction and Maintenance," will be read by Mr. Frank Grove, M.I.M. and Co.E., assistant county surveyor of Surrey, the following being a synopsis:

Brief history of roads from the time of the Romans to the present day—Traffic requirements immediately prior to the introduction of self-propelled vehicles—Details of road construction at that time—Effects of motor traffic on the old type of roads, and some methods employed to cope therewith—Description of a few of the modern methods of road construction and maintenance employed during recent years in the county of Surrey.

The chair will be taken at 7.30 p.m.

A. S. E. Ackermann,
Secretary.

17 Victoria-street, S.W.

EASTER HOLIDAYS.

Owing to the necessity for going to press earlier than usual, news and advertisement matter intended for insertion in next week's issue of "The Surveyor" must reach us not later than Wednesday morning, March 31st.

An Interrupted Contract.—The Metropolitan Water Board in December last accepted the tender of Messrs. R. Robinson & Co., of £5,798, for the construction of covered service reservoirs at Betsom's Hill and Westerham Hill. The Works and Stores Committee have now had before them a report by the chief engineer stating that, owing to the contractors being unable to obtain ballast for concrete, he has permitted them to suspend work upon their contract until more normal conditions prevail and granted an extension of the contract time.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

BOOK-KEEPER AND STORES CLERK. March 29th.—Corporation of Harrogate. £1 15s. per week.—Mr. C. E. Rivers, borough engineer, Municipal Offices.

SURVEYOR'S JUNIOR ASSISTANT. March 29th.—Corporation of Congleton.—Mr. J. H. Walters, borough surveyor, Town Hall, Congleton.

SURVEYOR AND INSPECTOR. March 29th.—Bolsover Urban District Council. £160 per annum.—Mr. H. J. Watson, clerk, 32 Glumangate, Chesterfield.

BUILDING INSPECTOR AND CLERK OF WORKS. March 30th.—Corporation of Torquay. £130 per annum.—Mr. Henry A. Garrett, borough engineer and surveyor, Town Hall.

INSPECTOR OF NUISANCES. March 30th.—Lowestoft Town Council. £200 per annum.—Mr. R. B. Nicholson, town clerk.

ASSISTANT ENGINEERS. — April 1st. — Indian Public Works and State Railways Department.—Secretary, Public Works Department, India Office, London, S.W.

INSPECTOR OF NUISANCES. — April 3rd. — Twickenham Urban District Council. £140—£150 per annum.—Mr. H. J. Saunders, clerk.

ASSISTANT SURVEYOR AND INSPECTOR. April 6th.—Kingswood Urban District Council. 25s. per week.—The Clerk, Council Offices, Kingswood, Bristol.

SUPERINTENDENT OF HIGHWAYS. April 8th.—Corporation of Huddersfield. £130 per annum.—Mr. K. F. Campbell, borough engineer and surveyor, 1 Peel-street, Huddersfield.

DRAUGHTSMAN. For the Nigerian Government Railway. £300—£350 per annum.—Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W.

COST CLERK.—Sheffield Corporation.—General Manager, Water Department, Town Hall.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

WHITEHAVEN.—April 21st.—Competitive designs for laying out the coach road site (6 acres 1 rood 25 poles) and the erection of houses, for the town council. Premiums, 30, 20 and 10 guineas.—Mr. T. Brown, town clerk.

GALEMIRE.—Designs for a small hospital, for the Galemire (Whitehaven) Joint Hospital Committee.—Mr. E. B. Croasdell, clerk, Union Hall, Whitehaven.

STEPNEY.—Designs for municipal buildings, for the borough council. Mr. H. T. Hare, F.R.I.B.A., has been appointed assessor.—Mr. G. W. Clarke, town clerk, 15 Great Alie-street, Whitechapel.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

DUNDEE.—March 29th.—For the erection of an electricity sub-station, for the corporation.—Mr. H. Richardson, general manager and engineer, Electricity Department, Dundee.

KENDAL.—March 29th.—For the construction of walls in blue brick at the sewage disposal works, for the corporation.—Mr. F. W. Oxberry, borough engineer and surveyor.

LLANELLY.—March 29th.—For the erection of sixty-one houses, for the corporation.—Borough Surveyor.

SHREWSBURY.—March 29th.—For the erection of a urinal, bath, and other works, for the corporation.—Mr. A. W. Ward, borough surveyor, The Square, Shrewsbury.

MAESTEG.—March 29th.—For the erection of public lavatories and fire-hose station, for the urban district council.—Mr. S. J. Harpur, architect and surveyor, 32 Commercial-street, Maesteg.

LEYTON.—March 30th.—For the construction of underground conveniences, for the urban district council.—Mr. E. H. Essex, surveyor, Town Hall.

HAMMERSMITH.—March 30th.—For taking down and subsequently re-erecting the temporary floor over a swimming bath, for the borough council.—Mr. H. Mair, borough surveyor.

BRADFORD. March 30th.—For the erection of a sanatorium, for the City Architect, Town Hall.

CARMARTHEN. March 31st.—For the erection of a school, for the county council.—Mr. W. V. Morgan, county architect, County Education Offices, Carmarthen.

KIRKCALDY. March 31st.—For the construction of a concrete toe to the sloping wall in tidal basin, for the corporation.—Mr. R. Henderson, harbour engineer, 2 St. Andrew-square, Edinburgh.

LANCHESTER.—March 31st.—For additions to the sanatorium, for the Joint Hospital Board.—Mr. G. T. Wilson, architect, 22 Durham-road, Blackhill.

CLAREMORRIS.—March 31st.—For building four single and nine double cottages, for the rural district council.—Mr. J. W. Judge, clerk.

BEATH.—March 31st.—For the erection of a school, for the School Board.—Mr. G. C. Campbell, architect, Methil, Fife.

BEDWELLTY.—March 31st.—For the erection of a reinforced-concrete boiler-house, laundry, and two new blocks at the hospital, for the urban district council.—Mr. D. H. Price, surveyor, Abergoed.

HUDDERSFIELD.—April 1st.—For the erection of a shed for sand-drying plant and store shed, for the corporation.—Mr. K. F. Campbell, borough engineer and surveyor.

AXBRIDGE.—April 2nd.—For the construction of waterworks, for the rural district council.—Mr. A. Powell, engineer, 10 Orchard-street, College Green, Bristol.

ERITH.—April 3rd.—For the extension of the sanatorium, for the urban district council.—Mr. H. Hind, surveyor.

BLOFIELD.—April 3rd.—For the erection of six or ten cottages, for the rural district council.—The Clerk, 12 Bank-street, Norwich.

ANGLESEY.—April 7th.—For the erection of new schools, for the Education Committee.—Mr. J. Owen, county architect, Menai Bridge.

TETCRO April 5th. For the erection of a cruck turret in steel and concrete and other works, for the corporation.—Mr. E. A. Barnes, city engineer and surveyor.

CORNWALL.—April 10th.—For the erection of a school, for the Education Committee.—Mr. B. C. Andrew, architect, Biddicks-court, St. Austell.

TYRONE.—April 12th.—For additions to Dungannon House, and the erection of a pavilion and medical officer's residence, for the county council.—Mr. J. A. Hunter, Lurgan.

ASHINGTON.—April 17th.—For the erection of gas-works, for the urban district council.—Messrs. W. A. Valon & Son, Caxton House, Westminster, S.W.

CHERTSEY.—April 22nd.—For the erection of an additional engine-house, gas generating house, new work-shop and coal store adjoining the present pumping station, Byfleet Village, together with engine-sheds and other buildings, for the rural district council.—Mr. Charles Marchelon, Byfleet-corner, West Byfleet.

TETBURY.—April 23rd.—For sinking a borehole, for the urban district council.—Mr. H. J. Weaver, consulting engineer, Northgate Mansions, Gloucester.

GLASGOW.—April 29th.—For the wright and joiner's work in connection with the erection of a sanatorium and children's home, for the corporation.—Office of Works, 64 Cochrane-street, Glasgow.

Roads.

WATH-UPON-DEARNE.—March 29th.—For the supply of macadam, tar-macadam, kerbs, flags, and setts, for the urban district council.—Mr. J. H. Drew, engineer and surveyor.

DROXFORD.—March 29th.—For the supply of 1,250 tons of granite or hard stone, for the rural district council.—Mr. J. King, surveyor, Droxford, Hants.

BRIDGE.—March 29th.—For the supply of surface-picked and other hard flints and gravel, for the rural district council.—Mr. S. Sladden, highway surveyor, Littlebourne, Canterbury.

SKIPTON.—March 29th.—For the supply of lime-stone, granite, York setts, kerb and team labour, for the urban district council.—Mr. A. E. W. Aldridge, surveyor.

ST. PANCRAS.—March 29th.—For the removal of road sweepings and gully soil and horsing water vans, for the borough council.—Mr. W. Nisbet Blair, borough engineer and surveyor.

FRAMLINGHAM.—March 30th.—For the supply of broken granite and iron slag, for the urban district council.—Mr. Harry F. Rodwell, surveyor, Town Hall, Framlingham.

ROMFORD.—March 29th.—For the supply of 20,000 gallons of distilled tar, granite, and granite chippings, for the urban district council.—The Surveyor.

HARROGATE.—March 29th.—For the execution of private street works, for the corporation.—Mr. C. E. Rivers, borough engineer.

WEST ASHFORD.—March 29th.—For the supply of gravel, flints and Kentish rag-stone, for the rural district council.—Mr. A. Sims, surveyor, 3 Queen-street, Ashford.

CARDIGANSHIRE.—March 30th.—For strengthening and surfacing the Cardigan to Cenarth road with Welsh granite and tar-spraying, for the county council.—Mr. D. Davies, county surveyor, County Surveyor's Office, Brynhyfryd, Felinfach S.O.

GATESHEAD.—March 30th.—For cement path work in position, for the corporation.—Mr. N. P. Pattinson, borough engineer.

HADLEIGH.—March 30th.—For the supply of granite, for the urban district council.—Mr. H. W. F. Grimwade, clerk.

MID-LOTHIAN.—March 30th.—For conveying road materials, for the county council.—Road Offices, County Buildings, Edinburgh.

WARE.—March 30th.—For the supply of a new steam roller, for the urban district council.—Mr. G. H. Gisby, clerk, Town Hall.

TOTTENHAM.—March 30th.—For wood paving on a concrete foundation, for the urban district council.—Mr. W. H. Prescott, engineer.

CHESTER-LE-STREET.—March 30th.—For the supply of whinstone, blasting furnace slag, tar-macadam and cartage, for the rural district council.—Mr. G. W. Ayton, highway surveyor, Union Offices, Chester-le-Street.

FARNHAM.—March 30th.—For steam rolling and scarifying, for the rural district council.—Mr. A. Laker, clerk.

LYDD.—March 31st.—For the supply of Kent rag-stone, tarred and not tarred, for the corporation.—Mr. T. Kebbell, borough surveyor.

WELLINGTON.—March 31st.—For the supply of broken stone and broken slag, for the rural district council.—Mr. R. B. Phillips, surveyor, Edgbaston House, Wellington, Salop.

ISLE OF WIGHT.—March 31st.—For widening a road, for the rural district council.—Mr. H. Eldridge Stratton, clerk, 30 Pyle-street, Newport, I.W.

RICHMOND.—March 31st.—For repaving with granite the roadway of Richmond Bridge and approaches, for the Richmond Bridge Commissioners.—Mr. E. Cruttwell, engineer, 2 Queen Anne's-gate, Westminster.

MALDON.—March 31st.—For the supply of broken granite, granite chippings and flints, also for steam rolling, for the corporation.—Mr. Thos. R. Swales, borough engineer and surveyor, Municipal Offices.

WITHNELL.—March 31st.—For the supply of broken granite, chippings and limestone, for the urban district council.—Mr. J. Taylor, clerk.

LEPTON.—April 1st.—For the supply of granite and dross, for the urban district council.—Mr. G. W. Smith, clerk, 23 John William-street, Huddersfield.

ANDOVER.—April 1st.—For the supply of hand-picked surface flints and broken granite, for the rural district council.—Mr. J. Wormold, district surveyor, South Cottage, Andover.

MAGOR AND ST. MELLONS.—April 1st.—For the supply of broken limestone and gravel, for the rural district council.—The Surveyor, Union Offices, Queen's Hill, Newport, I.W.

LIMEHURST.—April 1st.—For the supply of road materials, for the rural district council.—Mr. H. H. Turner, surveyor, Waterloo, near Ashton-under-Lyne.

LEPTON.—April 2nd.—For steam rolling and scarifying, for the urban district council.—Mr. G. W. Smith, clerk, 23 John William-street, Huddersfield.

KIRKBURTON.—April 2nd.—For steam rolling and scarifying, for the urban district council.—Mr. G. W. Smith, clerk.

KEIGHLEY.—April 3rd.—For laying tar-macadam on 700 sq. yds. of roads and footpaths, for the Joint Hospital Board.—Messrs. Moore & Crabtree, Town Hall-square, Keighley.

PATRINGTON.—April 3rd.—For the supply of road stone, for the rural district council.—Mr. W. H. Snaith, surveyor, Patrington, near Hull.

RAMSEY.—April 3rd.—For the supply of tarred slag, broken granite, and granite chips, for the urban district council.—Mr. R. F. Serjeant, clerk.

TENTERDEN.—April 5th.—For the supply of granite or other approved macadam, for the rural district council.—Mr. W. L. C. Turner, district surveyor, Tenterden.

BOLTON-UPON-DEARNE.—April 5th.—For carrying out street works, for the urban district council.—Mr. J. W. Wilson, surveyor.

FOOTS CRAY.—April 5th.—For the supply of road materials, for the urban district council.—Mr. W. A. Farnham, surveyor, Sidcup.

BENTLEY.—April 5th.—For the supply of tar-macadam, whinstone and dross, for the urban district council.—Mr. R. G. Whitley, surveyor.

BILLERICAY.—April 5th.—For the supply of granite, Kentish rag, Kentish flints, gravel, screenings, sand, cartage, and man and horse hire, for the rural district council.—Mr. F. E. Ennals, surveyor, Shelley-road, Hutton, Essex.

GLASGOW.—April 6th.—For paving several streets with compressed rock asphalt, for the corporation.—Office of Public Works, 64 Cochrane-street.

DUMBARTONSHIRE.—April 7th.—For the supply of whinstone, for the county council.—Mr. J. F. Robertson, 179 West George-street, Glasgow.

KINGSTON-UPON-THAMES.—April 7th.—For the supply of 1,700 tons of Guernsey, Quenast, or other granite, for the corporation.—Mr. R. Hampton Clucas, borough surveyor.

HUDDERSFIELD.—April 7th.—For the supply of 490,000 creosoted Baltic red wood blocks, size 9 in. by 3 in. by 5 in. deep, for the corporation.—Mr. K. F. Campbell, borough engineer and surveyor.

HORNSEY.—April 7th.—For making up a passage-way, for the town council.—Mr. E. J. Lovegrove, borough engineer and surveyor.

SWANSEA.—April 7th.—For the supply of [illegible] and 30,000 [illegible] for the corporation.—Borough Surveyor, [illegible], Swansea.

HOUGHTON-LE-SPRING.—April 8th.—For the supply of machine-broken blast-furnace slag, hand-broken whinstone, slag, and blue limestone riddlings, for the rural district council.—Mr. D. Balfour, 3 St. Nicholas' Buildings, Newcastle-on-Tyne.

ALTON.—April 8th.—For steam rolling and the supply of broken granite, for the rural district council.—Mr. C. W. Maudsley, surveyor, Park-close, Alton, Hants.

BULKINGTON.—April 10th.—For the supply of broken granite and haulage, for the urban district council.—Mr. C. Blakeway, clerk, 2 Church-street, Nuneaton.

MALDENS AND COOMBE.—April 13th.—For making up and maintaining South-lane (part of), measuring 886 ft.; for paving with artificial stone slabs the footways in South-lane; and for constructing 625 yds. of 18-in. and 15-in. concrete tube, and about 82 yds. of 9-in. stoneware pipe surface-water sewer, together with manholes, for the urban district council.—Mr. R. H. Jeffes, engineer and surveyor.

Sanitary.

CRANBROOK.—March 29th.—For the construction of sewage disposal works, for the rural district council.—Mr. J. H. Bailey, sanitary surveyor.

HAMBLEDON.—March 29th.—For the collection and removal of refuse, for the rural district council.—Mr. F. Smallpeice, clerk, 138 High-street, Guildford.

SOUTHGATE.—March 30th.—For the supply of disinfectants, for the urban district council.—Mr. C. G. Lawson, surveyor.

TOTTINGTON.—March 31st.—For the removal of house refuse, for the urban district council.—Mr. L. Kenyon, surveyor.

MANSFIELD.—April 3rd.—For laying stoneware pipe sewers, for the corporation.—Mr. T. P. Collinge, borough engineer and surveyor.

STANLEY.—April 5th.—For cleansing ashpits and removing house refuse, for the urban district council.—Mr. J. G. Ridley, clerk.

CHURCH.—April 5th.—For work of sewerage, for the urban district council.—Mr. J. B. Fallowfield, surveyor, Church, Lancs.

PRESTWICH.—April 6th.—For the construction of a storm-water drain, tube sewers, and manholes, for the urban district council.—Mr. S. H. Morgan, engineer, Prestwich, Lancs.

RUISLIP-NORTHWOOD.—April 7th.—For certain supplementary works for sewage disposal at the purification works, consisting of sedimentation tank, bacteria beds, humus tank, pipe connections, sluice gates, valves, and other fitments, for the urban district council.—Mr. H. Howard Humphreys, consulting engineer, 28 Victoria-street, Westminster, S.W.

UXBRIDGE.—April 8th.—For the construction of a sewerage scheme, for the rural district council.—Mr. J. W. Harrison, engineer and surveyor.

SWANSEA.—April 8th.—For the construction of stoneware pipe sewers, and manholes, for the corporation.—[illegible].

DEWSBURY.—April 9th.—For the supply of disinfecting powder and disinfecting fluid, for the corporation.—Mr. B. Ellis, town clerk.

THURROCK.—April 19th.—For the construction of about 4 miles of stoneware and iron sewers of 9-in., 12-in. and 15-in. diameter, with manholes and other appurtenances, engine-house, screen chambers, suction tank, and about 1½ miles of 12-in. pumping main, for the Joint Sewerage Board.—Mr. G. Midgley Taylor, engineer, Caxton House, Westminster, S.W.

RAWMARSH.—For relaying part of the main sewers in the South Ward, comprising about 700 yds. of 18-in. pipes or tubes, and 700 yds. of 9-in. pipes, with manholes, flushing chambers, and ventilation shafts, for the urban district council.—Mr. J. A. Tonge, engineer, Parkgate, Yorks.

Stores.

GUILDFORD.—March 29th.—For the supply of tarmacadam, broken granite, best broken slag, chippings, [illegible] steam pipes, disinfectants, horse hire and cartage, iron castings, ironmongery, lubricating and other oils, pitch and tar, Portland cement and lias lime, stoneware pipes, saddlery and harness repairs, for the corporation.—Mr. E. Young Harrison, borough surveyor, Tuns Gate, Guildford.

SOUTHAMPTON.—April 7th.—For the supply of stores and material, including broken granite, for the corporation.—Borough Engineer.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted † Recommended for acceptance
‡ Provisionally accepted

[illegible] the following tenders have been accepted by the rural district council for municipal works or supplies.
[illegible] Surveyor
[illegible] Granite Company, Ludlow; [illegible], Shrewsbury.
[illegible] Penmaenmawr and Welsh Granite Company; Penmaenmawr. Pwllheli Granite [illegible]; Carrog Granite Company, Chirk, North Wales.
[illegible] Welton & Sons, Chesterfield. H. [illegible] & Co., Stockport.
[illegible] Hedges, R. Allen, Wrexham.
Cinders.—Salt Union, Limited, Winsford; G. Bozson, junr., [illegible].
[illegible] Needham & Sons, Stockport.
[illegible] Hensbarrow Road Asylum, [illegible].

CAISTOR.—Accepted for the supply of 7,100 tons of granite, [illegible] for the repair of [illegible] for the county.
Granite.—Ellis & Everard, Bardon Hill; M. Jackson & Son, Louth; Ord & Maddison, Darlington; Mountsorrel Company, Mountsorrel.
Slag.—[illegible] & Son, Kelsey.
Tar-macadam.—Atkinson & Son, Kelsey.

CONGLETON.—The following tenders have been accepted [illegible] H. Webster, borough surveyor:—
[illegible] Penmaenmawr and Welsh Granite Company, Limited; Ellis & Everard.
Slag.—[illegible] Company, Limited, Hackington; T. Mellor, Congleton.
Flag.—[illegible] Company, Limited, Hackington; T. Mellor, Congleton.
Kerbs.—T. Mellor, Congleton.
Channelling.—T. Mellor, Congleton.
Horse Provender—to September 30th next.—C. Caudwell.

EASTRY.—For the supply of flints and steam rolling, for the rural district council.—Mr. D. E. Foster, surveyor, Sandwich.
A. [illegible] Ham, 100 yds. at 7s. Woodnesborough, 340 yds. at 6s.
J. Bass, Mongeham.—Ham, 100 yds. at 7s. 6d.; Great Mongeham, 340 yds. at 6s.; Sholden, 140 yds. at 6s. 6d.
Mrs. Birch, Tilmanstone.—Northbourne, 600 yds. at 4s.
A. O. Megs, Ripple.—Ripple, 340 yds. at 6s. 6d.
Wingham Company, Wingham.—Staple, 600 yds. at 6s. 8d.; Ash (Section 2), 600 yds. at 7s. 6d.; Elmstone, 100 yds. at 7s. 5d.; Goodnestone, 800 yds. at 6s. 6d.; Preston, [illegible] Southmouth, 200 yds. at 7s. 6d.; [illegible] Ash (Section 1), 800 yds. at 7s. 6d.
R. Elvey, [illegible] Ash Section 1, 800 yds. at 7s. 6d.
Wingham Company, Wingham.—Steam rolling (Section 2), [illegible] yds.
H. E. Blunt, Sholden.—Steam rolling (Section 1), 5,100 yds. [illegible].

[illegible] earthenware [illegible] sewers, for the rural district council.—Mr. J. R. Lupton, surveyor:—
E. Dyson, Pelton, Co. Durham, £149.

Middleton.—For [illegible] and draining [illegible] for the corporation.—A. Welburn, borough [illegible].
W. Bailey & Co., Limited, Manchester £482
R. Heard, Middleton Junction . . 430
R. Partington & Son, [illegible]eton 421
R. Taylor, Middleton* 373

MIDDLETON.—For surfacing a carriageway, for the corporation.—Mr. W. Welburn, borough surveyor:—
R. Partington & Son, [illegible]eton £912
W. H. Worthington & Sons, Manchester 769
W. Shepherd & Son, Rochdale* 768

OXENDON.—For the supply of road materials, for the rural district council.—Mr. W. J. Smith, surveyor, Market Harborough:—
2½-in. Best Granite, at Harborough Station.—Cliffe Hill Granite Company, Markfield, 9s. 2d. per ton; Groby Granite Company, Groby, 8s. 10d. per ton; Whitwick Granite Company, Whitwick, 8s. 11d. per ton; Enderby Granite Company, Enderby, 8s. 10d. per ton.
2½-in. Seconds Granite, at Harborough Station.—Cliffe Hill & Everard, Bardon Hill, 7s. 9d. per ton.
At Welford Wharf.—Mountsorrel Granite Company, 8s. 11d. per ton.
Best Slag, at Harborough Station.—Smart & Sons, Cransley Furnaces, 5s. 3d. per ton.
(Other stations in proportion.)

RAWTENSTALL.—Accepted for making up [illegible] streets, for the corporation.—Mr. J. Johnson, borough surveyor:—
E. Hanson, Rawtenstall.

RICHMOND (Surrey).—The following tenders have been accepted by the corporation:—
Baxter & Wray, Richmond.—Portland cement and grey Lime.
F. Brown & Co., Richmond.—Thames Ballast.
J. Bates, Richmond.—Gravel and pit ballast.
Pontifex & Co., London.—Ironfounders' work.
Patent Victoria Stone Company, Limited; Adamant Stone and Paving Company, Limited.—Artificial stone slab paving.
Rowe & Mitchell.—Granite delivered at Brentford.
Enderby and Stoney Stanton Granite Company.—Granite delivered at Kew Bridge railway station.
Smeed, Dean & Co.—Chalk flints and brown flints.
Wettern Brothers, Limited.—Granite kerb, channel setts, and quadrants.
J. Farrer & Sons, Limited.—York paving.
Brooks, Limited.—Non-slip stone.
Gas Light and Coke Company, Limited.—Dehydrated tar.
Tarmac, Limited.—Tarred macadam.
Two tenders were received for cartage—viz., from J. Bates and Stevens Brothers, who each quoted at the same rates, and the council agreed to accept both tenders.

THAKEHAM.—For the supply of broken basalt or granite and unbroken flints, for the rural district council.—Mr. W. Forrester, surveyor:—
Groby Granite Company, Leicester.—Granite, 14s. 5d. and 14s. 6d. per ton; chippings, 10s. 11d. and 11s. per ton.
Croft Granite Company, Croft.—Jersey granite, 13s. 8d. per ton.

UPPINGHAM.—For the supply of granite and screenings, for the rural district council.—Mr. T. Northen, surveyor:—
Granite.—Ellis & Everard, Bardon Hill, 2,000 tons; Cliffe Hill Granite Company, Markfield, 2,000 tons.
Slag.—Prestwich & Sons, Dronfield, as required; Holwell Iron Company, Asfordby, as required.

WARE.—Accepted for the supply of tar-macadam and granite, for the urban district council.—Mr. G. H. Gisby, clerk:—
Tarmac, Limited, Wolverhampton.—16s. 2d. per ton for 2½-in., 1½-in., and ⅝-in. ironstone slag tar-macadam.
W. Griffiths & Co., Limited, London, E.C.—12s. 8d. per ton for 1½-in. Grieff granite; 13s. 2d. per ton for 1½-in. ditto; 14s. 2d. per ton for 2-in. ditto; 11s. 5d. per ton for ¼-in. to dust ditto.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

MARCH.

26.—Institution of Municipal and County Engineers: South-Eastern District Meeting. 92 Victoria-street, S.W., 6 p.m.
27.—Institution of Municipal and County Engineers: South Wales District Meeting at Cardiff.
27.—Institution of Municipal and County Engineers: South-Western District Meeting at Taunton.

APRIL.

10.—Institution of Municipal and County Engineers: East Midland District Meeting at Loughborough.
13.—Society of Engineers: Mr. Frank Grove, assistant county surveyor of Surrey, on "Main Roads, Past and Present, and Modern Methods of Construction and Maintenance." Institution of Electrical Engineers. 7.30 p.m.

MAY.

28.—Royal Sanitary Institute: Meeting at Shrewsbury. Discussion on "The Value of Mechanical Filters in the Purification of Water." 7.30 p.m.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

BOROUGH OF TORQUAY.

The Torquay Town Council is prepared to receive applications for the appointment of "Building Inspector and Clerk of Works for New Buildings by Administration," at a salary of £130 per annum.

Candidates must be thoroughly qualified persons, and have had experience in the administration of Building By-laws, and will be required to undertake the inspection and testing the drainage of all new Buildings, and keep all records in connection therewith. Candidates must have had good practical experience in all branches of the Building Trade, and the person appointed will be required to devote his whole time to the duties.

Applications, in candidate's own handwriting, stating age, experience, past and present employment, accompanied by copies of not more than three testimonials, and endorsed "Building Inspector," to be sent to the undersigned not later than Tuesday, March 30th.

Canvassing, directly or indirectly, will be considered a disqualification.

HENRY A. GARRETT, A.M.I.C.E., &c.,
Borough Engineer and Surveyor,
Torquay.

Town Hall, Torquay.
March 15, 1915. (2,475)

UNIVERSITY OF LIVERPOOL.

FACULTY OF ARTS.

CHAIR OF CIVIC DESIGN.

The Council invite applications for this Chair, which is associated with the School of Architecture. Salary £400. Residence required from 1 October to 31 March. Professional practice allowed on conditions. Duties to begin 1 October, 1915. Applications, together with the names of three persons to whom reference may be made, and twelve copies of not more than six testimonials, should be forwarded to the undersigned on or before 10 May, 1915. Further particulars regarding conditions and duties may be had on application.

EDWARD CAREY,
(2,472) Registrar.

WANTAGE RURAL DISTRICT COUNCIL.

TEMPORARY ENGINEERING ASSISTANT FOR WATER SUPPLY, SEWERAGE AND SEWAGE DISPOSAL SCHEMES.

Applications are invited for the appointment of a Temporary Assistant in the Engineer's and Surveyor's Office, for a period of about 12 months at a salary of two and a-half guineas per week, subject to one month's notice on either side.

Applicants must be good draughtsmen, accurate surveyors and levellers, and proficient in the preparation of Specifications, Bills of Quantities, and Estimates.

Applications, stating age and experience, accompanied by copies of three recent testimonials, to be sent to the undersigned not later than Tuesday, the 6th day of April, 1915.

JOHN W. HARRIS.
Engineer and Surveyor.

East Challow,
Wantage, Berks.
March 20, 1915. (2,496)

SHEFFIELD CORPORATION WATER DEPARTMENT.

EWDEN VALLEY RESERVOIR WORKS.

COST CLERK.

Cost-Accountant, thoroughly qualified, with practical experience in Engineering and Contractors' costing, preferably on public works.

Apply, stating age, experience, and salary required, with copies of three recent testimonials—

GENERAL MANAGER.

Water Department,
Town Hall, Sheffield. (2,504)

COUNTY BOROUGH OF HUDDERSFIELD.

The Corporation require the services of an experienced District Superintendent of Highways to take charge of a District under the Borough Engineer.

Applicants must have had practical experience in sewering, paving and macadamising of roads, and be competent to set out and measure up work, and keep daily accounts of all labour and materials used.

The person appointed must have had previous practical experience in a similar situation, and be prepared to reside within his District.

For statement of duties apply to the Borough Engineer.

Salary, £130 per annum.

Applications, in the handwriting of candidates, giving full particulars of present and previous occupation, age, &c., accompanied by copies of not more than three testimonials of recent date, endorsed "District Superintendent of Highways," must reach me not later than 10 a.m. on Thursday, the 8th April, 1915.

Canvassing will disqualify.

K. F. CAMPBELL, M.INST.C.E.,
Borough Engineer and Surveyor.

1 Peel-street,
Huddersfield.
March 23, 1915. (2,503)

ASSISTANT to Surveyor and Inspector of Nuisances, Kingswood Urban District Council. 25s. per week. Stenographer and typewriter preferred. No canvassing. Applications endorsed "Assistantship"), with two testimonials, by 6th April, to the Clerk, Council Offices, Kingswood, Bristol. (2,501)

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. APRIL 2, 1915. No. 1,211.

Minutes of Proceedings.

Royal Commission on Sewage Disposal: Final Report.

The long expected Final Report of the Royal Commission on Sewage Disposal has now been published. It gives the results of an inquiry which has extended over a period of sixteen years, and although it consists almost entirely of a recapitulation of the conclusions already published in the preceding nine reports, these have been so well summarised that we feel we cannot do better than reproduce the major portion for the benefit of our readers in the form of the copious extract which are printed on another page. The Ninth Report issued simultaneously with the Final Report, deals with the discharge of manufacturing wastes which for any reason could not be taken into sewers, and with the disposal of these to rivers in rural areas, and will be discussed in detail in the place on another occasion. The other eight reports were reviewed in these columns from time to time as they appeared, and it now remains to sum up the total result of the long extended labours of the commission. It must be confessed that we were somewhat disappointed to find in this Final Report merely a bare recapitulation of the conclusions of the earlier reports as we expected to see a careful review of the whole subject. Possibly the commissioners have taken the view as we did that the really effective results of the whole of their work, at any rate so far as the disposal of ordinary town's sewage is concerned, were embodied in the conclusions and recommendations contained in the Eighth Report. It is true that the conclusions in the Fifth Report, which dealt with the relative merits of the various methods available for the purification of the sewage of towns, have already been largely adopted by the Local Government Board and applied to the many schemes which they have had under consideration since that report was published, and in this way a great advance in the application of modern methods of treatment has been secured. The real effect of this was, however, simply to bring the official requirements up to date and in conformity with the knowledge and experience of the subject already possessed by engineers and others engaged in this branch of work. The Eighth Report, on the other hand, in its conclusions, suggested a distinct advance beyond anything that had previously been proposed by fixing a *general* standard for effluents, and making provisions for the fixing of *special* standards under certain conditions, varying with the amount of dilution afforded by the stream into which the sewage effluent is discharged. It is also important to note that, in determining these standards, the object in view was to devise a system whereby a local authority should not be required to incur any further expenditure on sewage disposal than would suffice to prevent the occurrence of actual nuisance.

If we ignore the chronological sequence of the nine reports and consider the whole of the work done, the results may be summed up very briefly as follows: In the first place, the old idea that land treatment was absolutely essential is dropped, and it is recognised that artificial processes can be made to produce effluents which will not putrefy or produce a nuisance in a stream. Then we have, in the Fifth Report, a very elaborate description of a number of different artificial processes, and a careful comparison of the efficiency of various combinations of the different methods of preliminary treatment and filtration. The cost of operating these various combinations of methods is dealt with in the same report, and also the question of sludge disposal and the treatment of storm water. Further, in the Eighth Report, standards are fixed for sewage effluents, and it is stated that the volume of river water, as compared with the effluent, should be the governing factor in selecting any of these standards. It is also recommended that the law should be altered so that a person discharging sewage matter into a stream shall not be deemed to have committed an offence under the Rivers Pollution Act, 1876, if the sewage matter is discharged in a form which satisfies the requirements of the prescribed standard. With regard to trade wastes, these are dealt with very fully in the Third and Ninth Reports. Recommendations are made that the law should be altered so as to make it the duty of the local authority to take trade wastes into the sewers where this is possible, and, for cases where it is not possible, standards are prescribed for a large number of different trade wastes. Finally, for the proper carrying out of the control and protection of all rivers, it is recommended that Rivers Boards should be formed for all watersheds in the country, and that a central authority should be set up as the supreme rivers authority, in control of the Rivers Boards, to deal with matters relating to rivers and their purification, and, if necessary, to take action where local authorities have failed to do so, as well as to settle differences between local authorities and manufacturers. All that now remains to be done is to place these recommendations upon the Statute Book, so that they may be put into actual operation. It was rumoured some time ago that a Bill on these lines had actually been drafted, but that the Government could not find time for its introduction. In what way this important matter will be affected by the present

national crisis is a subject for speculation. Social legislation of this kind, even if it is non-contentious, may have to be postponed indefinitely on account of the cost. On the other hand, the annual expenditure involved in this matter should be exceedingly small when compared with the sums spent annually on other matters, and the benefit to the country generally would be very great. If, therefore, this proposed legislation may be described as non contentious, as we think it well may be, the present Session would seem to be a suitable opportunity for the consideration of a Bill embodying the recommendations of the Royal Commission. Full discussion in a friendly manner on both sides of the House of Commons should produce a really satisfactory Act. If this opportunity is not seized, the amount of work in Parliament after the war will probably be so great that the question of rivers protection and sewage disposal will most likely be put on one side for many years.

The work done by the Royal Commission has, with one or two exceptions, been good. The attempt to prepare comparative estimates of the cost of construction of various types of disposal works was unsatisfactory and apt to be very misleading. There are so many variable factors, due to the diversity of conditions in different places that each separate scheme must be considered on its merits, and no general rule can be formulated. Then, again, in making recommendations for the capacities of filters with different grades of material, dealing with sewages of different strengths, and preceded by different types of preliminary treatment, the figures given as the number of gallons of sewage for which 1 cubic yard of filtering material should be provided are in some cases too low, in others too high. Further, it is not made clear that these should be the *maximum* number of gallons to be treated on 1 cubic yard of filter material. Persons not possessing the necessary experience to enable them to form a sound judgment in the matter are apt to take the figures given by the Royal Commission as applicable to all and every condition, regardless of other considerations, with the result that their works are failures for the lack of a proper margin of safety in the size of the filters. In this connection it appears to us that the Royal Commission have missed a good opportunity for making a really useful change in the method of calculating the dimensions of filters. Domestic sewage, in all cases, contains the wastes from a certain number of persons, and the amount of impurities due to these wastes must be fairly uniform per person. In some towns and villages the impurities from each person are contained in 10 gallons of sewage, while in others they may be contained in anything up to 30, or even 40, gallons of sewage. All calculations are now based upon the daily dry-weather volume of sewage, and some attempt is made to provide for the variation of strength by giving separate figures for weak, medium, and strong sewages. The inexperienced person, anxious to give a preliminary estimate for a scheme at the lowest possible figure, and filled with confidence in the wisdom of the Royal Commission, takes the figure applicable to his particular system of treatment, which gives the least number of cubic yards for his filters, and quotes the result as being in accordance with the Local Government Board's *requirements!* This is one of the unsatisfactory effects of the publication of definite figures for the size of filters, and we think it might have been avoided to a large extent if the Royal Commission had taken the bold course of dropping the old method of calculating in "gallons per cubic yard" and substituting "cubic yards of filtering material per person (or per 1,000 persons) connected to the sewers." In conclusion, we may say that the work done by the Royal Commission in the sanitary survey of a number of rivers, as recorded in the Appendix to the Eighth Report, and which formed the basis upon which the Eighth Report was prepared, was excellent and worthy of every commendation. The information contained in the Appendix will be very useful in the future, and the recommendations made in the Eighth Report are very safe so long as care is taken to see that they are properly followed. So far as we are aware, these recommendations have not yet been adopted by the Local Government Board, but schemes will doubtless be presented to them on these lines in due course, and we hope they will not be rejected solely because the recommendations have not yet been legally enacted, but that they will receive consideration on their merits.

Extraordinary Traffic.

The paper on "Extraordinary Traffic" which was read at the Cardiff meeting of the Institution of Municipal and County Engineers by Mr. D. M. Jenkins, the borough surveyor of Neath, may best be described as a very able account of a difficult subject based upon the author's practical experience. The history of the law as to extraordinary traffic is not without interest. Prior to 1878 there was no procedure by which extraordinary expenses could be recovered in a civil action, the only remedy known to the law in case of damage to a highway being by indictment for a public nuisance. In that year, however, was passed the Highways and Locomotives (Amendment) Act, by sec. 23 of which the burden of extraordinary expenses incurred by a highway authority in the repair of a road was placed upon the shoulders of the person responsible for the traffic by which the damage was caused. This section, as amended by sec. 12 of the Locomotives Act, 1898, is still the foundation of the right of a highway authority to recover such expenses. In considering these enactments it should be borne in mind that the object of the Legislature in passing them was not to *prevent* extraordinary traffic, but merely to throw on the person who causes such traffic the liability to pay for the damage it does the road. In dealing with the question of what constitutes extraordinary traffic, Mr. Jenkins laid down four principles, three of which may fairly be extracted from the judgments delivered by the Court of Appeal in *Hill v. Thomas* (1893, 2 Q.B. 340), in which the earlier decisions were reviewed. It was there held that "extraordinary traffic" includes all such continuous or repeated user of the road by a person's vehicles as is out of the common order of traffic, and as may be calculated to damage the highway and increase the expenditure on its repair. "Extraordinary traffic" is really a carriage of articles over the road, at either one or more times, which is so exceptional in the quality or quantity of articles carried, or in the mode or time of user of the road, as substantially to alter and increase the burden imposed by ordinary traffic on the road, and to cause damage and expense thereby beyond what is common. Traffic is not extraordinary, however, merely because one man uses a road more than others do, even if it be his own user which has produced the mischief to the road. The traffic must be extraordinary as regards the ordinary user of the road as a whole by all who use it, and not merely large as regards the traffic put on the road by other persons.

The other principle laid down by Mr. Jenkins was that traffic may be extraordinary merely by reason of the mode in which it is conducted. In considering what parties should be made defendants in an action to recover extraordinary expenses, the provisions of sec. 12 of the Act of 1898 are important. It is therein enacted that the expenses are recoverable from "any person" by

of in consequence of whose order the weight of traffic has been ordered. The amendment of the law by substituting the words "by or in consequence of whose order" for the expression "by whose order" as used in sec. 23 of the Highways and Locomotives (Amendment) Act, 1878, is based upon the decision of the House of Lords in *Kent County Council v. Lord Gerrard* 1897, A.C., 633. It was held in that case that where Lord Gerrard requested by the delivery to him of materials by a contractor to be paid for by the district council, and the materials were conveyed along a certain highway, Lord Gerrard, knowing that it was intended to convey them by traction engines and trucks (although he did not pay the carriers or give specific orders as to the route or mode of carriage), he was not a "person in whose order such weight of traffic had been conducted." The object of the Legislature in altering the Act of 1878 was to bring a case like *Kent County Council v. Lord Gerrard, supra*, within its scope. The most recent finding appears to be to throw the liability upon the contractor, as being ultimately the person in whose consequence or whose order the damage is done.

In regard to the present recommendations made by Mr. Baines we would call emphasis to the fact that the obligation of the highway authority to maintain a road is not suspended during a period of extraordinary traffic, however much the road may be injured or affected. The authority must make all reasonable efforts to keep it safe and useful for the traffic both ordinary and extraordinary. Further, the authority should do its best to mitigate the ultimate damage by carrying out all such repairs whether permanent or temporary and neglect in this connection may expose the authority to the risk of a finding that the damage of which the complainant is attributable, wholly or in part, to their own default. And, second, the general practice which has been evolved from the various decisions of the Courts is to take the average cost of the five years preceding of maintaining the particular road concerned, and of similar roads in the neighbourhood, and to deduct this from the actual cost incurred on the former during and immediately after completing of the extraordinary traffic. Finally on the question of procedure, Mr. Baines gave some very useful hints for the surveyor's certificate, which is the first step in the legal formalities in connection with a claim, and for the conduct of the local authority authorising proceedings.

* * *

Exeter City Council and the Lowest Tender.

The problem of the lowest tender, like a very much larger issue in economics is always with us. It was discussed recently at the Exeter City Council in connection with the contract for making up certain roads, and it came out of the ordeal with flying colours it came, in fact, into its own, a position that had been denied to it by the Streets Committee, who, for reasons that seemed to be quite convincing to themselves, recommended the acceptance of a higher tender. The arguments *pro* and *con* in this instance put on the familiar lines, except that the Streets Committee sought to justify their action by the definite contention that they had "resolved to get a road builder" to do the work. It was a special sort of work, the chairman of the Streets Committee explained, the material to be used being pitch graphite. The firm whose tender they favoured were road builders, whereas that which had sent in the lowest tender were house builders, moreover, there was only a difference of £30 in the prices. The suggestion thrown out involving the question of competence was met by the assertion of a councillor that if the Streets Committee wanted only road makers to tender they should have said so in the advertisement. It might be contended in reply to this that the committee doubtless followed the customary practice of making the appeal to tenderers a wide one, and that, moreover, they gave their decision according to their view of the merits and capabilities of the various firms in what they regarded as special circumstances. The duty imposed upon them could not properly be enlarged to mean that if they did not exercise this privilege to the full. It would be equally ridiculous to suppose that they ought invariably to vote for the lowest tender. The matter is really more in practice as a question of the framing of the advertisement, which is frequently alleged to be drafted so as to favour the lowest tender.

* * *

Underpayment.

Having regard to the extraordinary conditions attached to the recently vacant appointment of surveyor to the St. Germans (Cornwall) Rural District Council, to which attention has already been directed in these columns, it is hardly surprising to find that the matter was discussed at the meeting held at Taunton last Saturday by the members of the South-Western District of the Institution of Municipal and County Engineers. The matter was introduced by Mr. C. O. Baines, of Paignton, who observed that for a number of years the conditions of appointments of this class have become more and more ridiculously restrictive and onerous in character, the salaries, however, appearing to vary in inverse ratio to the duties demanded. Mr. Baines desired to urge that the full power of the influence of the institution should be brought to bear to secure, if possible, some mitigation of the evil of over-restricted and under-paid appointments. A resolution designed to carry this desire into effect was not carried, presumably on the ground that the council of the institution are virtually powerless in the matter. The discussion, however, was none the less valuable, inasmuch as, in our view, the best weapon to use in the contest against these abuses is that of publicity. Moreover, we believe that a record of such cases is being kept at headquarters with a view to future use, but if we are wrong, we would suggest that this should be undertaken without delay.

* * *

Borrowing and the War.

In another column will be found a circular letter addressed last week by the Local Government Board to local authorities in England and Wales, dealing with the subject of borrowing for municipal works during the period of national crisis. In this circular the board state that they have come to an arrangement with the Treasury by which in most cases the board's sanction to a loan will be sufficient without any further Treasury approval. This arrangement applies to any sanction given since March 12th last, provided that the money is to be raised otherwise than by the issue of stock, bonds or bills, and its convenience to local authorities is manifest. It should be carefully observed, however, that where a local authority hold a sanction, approval or consent of the board of an earlier date than the 12th instant which has not yet been acted upon, whether wholly or in part, no further action must be taken upon it without a further sanction from the board authorising the action, unless the money is to be raised by the issue of stock, bonds or bill when the consent of the Treasury must be obtained instead of the further sanction of the board. The Treasury have further decided that their approval will not henceforth be required for the renewal or replacement by local authorities of maturing mortgages.

Extraordinary Traffic.*

By D. M. JENKINS, Assoc.M.Inst.C.E., Borough Surveyor, Neath.

This short paper on a much-debated subject is submitted in the hope that it will lead to a profitable discussion. It may be said at the outset that, owing to the great and general increase in recent years of mechanical traction on roads, the standard of maintenance by road authorities has necessarily been considerably raised, and that traffic which under the earlier conditions was rightly considered abnormal has now become more or less normal. This is, no doubt, true in regard to main and arterial roads along which heavy mechanically propelled traffic has become quite ordinary and general; but there still remain, and will continue to remain, classes of highways upon which the ordinary traffic is comparatively light, but which are from time to time liable to be subjected to heavy and dense traffic for special purposes. Claims in respect of extraordinary traffic, therefore, will continue to arise and call for the attention and consideration of road engineers.

The subject is briefly introduced under the following heads: (1) The enactments relating to extraordinary traffic; (2) what constitutes extraordinary traffic; (3) from whom expenses are recoverable; (4) the amount recoverable; (5) procedure.

(1) Enactments.

Mention may be made in passing of the excellent text-book on the subject by Barnard Lailey, of which the author has made free use, and which he found most helpful in working up a claim in which he was recently concerned.

Down to the year 1878 the only legal remedies available in respect of extraordinary traffic were those at Common Law; but, "short of causing a public nuisance, a highway might with impunity be subjected to excessive and wholly abnormal wear, caused in the course of an undertaking carried on for private gain, and by a person not even a ratepayer. The introduction of heavy locomotives for purposes of road traction accentuated this evil, and a change in the law was effected by the Highways and Locomotives (Amendment) Act, 1878, which provides:—

"Where, by a certificate of their surveyor, it appears to the authority which is liable or has undertaken to repair any highway, whether a main road or not, that, having regard to the average expense of repairing highways in the neighbourhood, extraordinary expenses have been incurred by such authority in repairing such highway by reason of the damage caused by excessive weight passing along the same, or extraordinary traffic thereon, such authority may recover in a summary manner from any person by whose order such weight or traffic has been conducted, the amount of such expenses as may be proved to the satisfaction of the Court having cognisance of the case to have been incurred by such authority by reason of the damage arising from such weight or traffic as aforesaid.

"Provided that any person against whom expenses are or may be recoverable under this section may enter into an agreement with such authority as is mentioned in this section for the payment to them of a composition in respect of such weight or traffic, and thereupon the person so paying the same shall not be subject to any proceedings under this section."

The only subsequent enactment on the subject is contained in sec. 12 of the Locomotives Act, 1898:—

"(1) Sec. 23 of the Highways and Locomotives (Amendment) Act, 1878 (which relates to the recovery of expenses of extraordinary traffic), shall be amended as follows: —

"(*a*) Expenses under that section shall cease to be recoverable in a summary manner, but may be recovered, if not exceeding £250, in the County Court, and if exceeding that sum in the High Court.

"(*b*) Proceedings for the recovery of any expenses incurred after the passing of this Act shall be commenced within twelve months of the time at which the damage has been done, or where the damage is the consequence of any particular building contract or work extending over a long period, shall be commenced not later than six months after the completion of the contract or work.

"(*c*) There shall be substituted for the words 'by whose order' the words 'by or in consequence of whose order.'

"(2) Nothing in this section shall affect the prosecution and determination of any proceedings which have been commenced before this Act shall come into operation."

(2) What constitutes extraordinary traffic.

The section quoted from the Act of 1878 refers to "damage caused by excessive weights" or "extraordinary traffic," and the author has for brevity used the latter term as inclusive of the former. As the result of a number of decisions of the Courts, which, in the earlier stages, varied considerably from one another, the following principles have been established: —

(1) "The question of whether weight is 'excessive' or traffic 'extraordinary' is to be determined by reference to the ordinary traffic on the particular road and to the character of that road.

(2) "The plaintiffs must show a user of the road by defendant which was out of the common order of traffic, and which substantially increased the burden imposed by the ordinary traffic.

(3) "Traffic may be 'extraordinary' by reason of the mode in which it is conducted (see, *e.g.*, *Mayor of Wolverhampton* v. *Salop County Council*).

(4) "It is not an answer to a claim that the traffic is of a kind common in the district, or that it would be ordinary traffic on neighbouring roads."

These principles may be best elucidated by a concrete example, and a few particulars are given of a case with which the author was concerned in his own district, but which, however, did not go to the Courts, but was settled after the issue of the writ. The road in question had a length of 5 furlongs. The ordinary traffic on it was light, consisting in the main of horse-drawn vehicles—such as farmers' and tradesmen's carts and private carriages. The extraordinary traffic consisted of the conveyance of large quantities of building and engineering materials used for the construction of a water service reservoir outside the borough for the Neath Rural District Council. The vehicles used for the purpose were heavy wagons carrying a load of 5 tons, drawn by steam traction engines.

The road had no artificial foundation, and had simply a surface coat of limestone metalling, steam rolled; but it carried the ordinary light traffic satisfactorily, and there was abundant evidence that under normal conditions it was adequately constructed and maintained.

Under the extraordinary traffic the surface was broken through, deep ruts were formed, the underlying subsoil (chiefly clay) was "spewed" up, and generally the road was completely disintegrated throughout its whole length.

It was argued on the other side that the road was used by other motor vehicles, but the fact was that this user was only occasional, and that the traffic which caused the damage was constant over a long period. The point underlying this is that with merely occasional heavy traffic the road has time to recover itself in between, whereas the continuous heavy traffic produced a constantly accumulating effect.

It was also urged that traffic of the kind which caused the damage was common in the district; but this contention, in view of the conditions which have hitherto obtained, was irrelevant. The question was whether the traffic on this particular road was extraordinary or not. If in the future heavy motor traffic on the road in connection with some established industry becomes general, then it will probably be the duty of the road authority to reconstruct and maintain it in a manner to properly withstand such traffic.

It may be mentioned that the legal meaning of extraordinary traffic as now established appears to coincide with the official view expressed in a circular issued by the Local Government Board in 1878, that the Act of that year would "prove serviceable in enabling highway authorities to recoup the heavy expenditure not infrequently occasioned by extraordinary and exceptionally heavy traffic arising from

* Paper read at the South Wales District meeting of the Institution of Municipal and County Engineers held at Cardiff last Saturday.

building and similar operations of a temporary character, and from other causes by which the road accommodation provided for all alike at the public expense is sometimes abused by individuals for private purposes."

(3) FROM WHOM EXPENSES ARE RECOVERABLE.

It will be recalled that under the Act of 1878 the obligation is imposed upon "any person by whose order" the traffic in question has been conducted.

In the common case of a large building erected by a builder in whose vehicles and by whose servants the materials for the building are conveyed along a highway, the earlier litigation on the subject appears to have decided that the builder is liable to the highway authority, notwithstanding that he is not building on his own account, but in performance of a contract with some other person.

For obvious reasons it became a frequent aim to make the employers of the builders liable, and, further, there arose claims in which the circumstances were such as to render it difficult, or even impossible, to establish a case against the person directly conducting the traffic.

In certain cases where sub-contractors were engaged by contractors and left free to select their own mode of haulage and chose to use traction engines, the sub-contractors were held liable; but where sub-contractors were employed to specifically convey materials by traction engines, the contractors or other employers were held liable. (The point about the use of traction engines is, of course, that much heavier loads are carried than in ordinary horse-drawn vehicles.) In the well-known case of *Kent County Council* v. *Lord Gerrard*, defendant carried on extensive building operations, and employed different persons to do the haulage of materials, leaving them free to choose their own means of conveyance, but knowing at the same time that haulage by traction engines was the only mode practicable. It was held that defendant was not the person "by whose order" traffic had been conducted, and it was further pointed out that the words of the Act were "by whose order" and not "in consequence of whose order."

As a result of this case the Amending Act of 1898 was passed. This substituted for the words "by whose order" the words "by or in consequence of whose order." The effect of the amendment is that either the person by whose order or the person in consequence of whose order traffic is conducted, or both, can be sued.

For some years after the legal view was that, unless the route or the mode of traffic was such as could not be foreseen, the Amending Act imposed the liability upon the employer. But a case arose in which a brick company were employed to deliver large quantities of bricks for building a house, with no directions as to the mode of delivery, and it was held that damage to roads was done in consequence of the order of the vendors of the bricks. The effect, however, of subsequent decisions is that a person entering into a contract as employer can only escape liability by showing that the route or method adopted was not a usual or natural one, and not within his contemplation when he entered into the contract. The most recent tendency appears to be to throw the liability upon the employer, as being ultimately the person by or in consequence of whose order the damage is done. This appears to be the equitable view, and for the following reasons: The cost of making good any incidental damage is really part of the cost of the building or other works for which materials are conveyed. The employer may specifically include the making good of damage to roads in the contract for the works, and therefore pay for it through the contractor. But in any case it seems that the liability to the highway authority should rest upon the employer, leaving it to him to enforce his remedy, if any, against his contractor.

It has become the general practice to provide in contracts for large buildings or other works that contractors are to be liable for claims in respect of extraordinary traffic, and, as bearing on this point, it may be mentioned that in the Reigate case, the highway authority having recovered from a water company extraordinary expenses arising from damage caused by the cartage of materials for the construction of a reservoir, the company recovered over, under a clause in the contract, against their contractor, who was brought in as a third party.

It is now generally recognised that the safe and most desirable course is to make both the employer and contractor defendants. It is always easy to drop a defendant upon [illegible] costs thrown away, in the event of its being found, upon discovery, that a claim cannot be maintained against a particular defendant, are not likely to be heavy," and quite worth the risk of not spreading the net wide enough. Cases may arise in which sub-contractors should also be brought in as parties—as, for example, when exceptionally heavy loads are carried or the traffic is confined to the same wheel-tracks instead of being distributed over the whole width of road; in such cases it is conceivable that the Court may apportion part of the expenses against the sub-contractor; but, of course, much must depend upon the terms of the sub-contract.

In the Neath case before-mentioned the rural district council entered into a contract for the construction of a service reservoir and incidental works, which included the supply and delivery of all materials. No specific mode of haulage was stipulated, and there was only one practicable route available for the traffic. The contractor engaged to convey the materials a local sub-contractor, who carries on a large haulage [illegible] only. The contract between the rural council and the contractor placed the whole liability for making good damage to the roads upon the contractor; but, so far as could be ascertained, there was no explicit arrangement on the subject as between the contractor and sub-contractor. In these circumstances it was considered that the cost of making good damage arising from extraordinary traffic having been provided for in the contract, and that haulage by heavy traction engines having been arranged for by the contractor as no doubt being the cheapest and most expeditious method, the contractor was equitably liable for the extraordinary expenses. Having regard, however, to the tendency in recent cases to fix the ultimate responsibility upon the employer, it was decided to join the rural council and the contractor as parties to the action. Further, the individual loads carried and their distribution on the road surface (and therefore the extent of the damage) being matters which depended upon the sub-contractor, it was thought advisable to make him also a party. Proceedings were therefore instituted against the council, the contractor and the sub-contractor.

(4) THE [illegible]

It must be clearly understood in the first place that the obligation of the highway authority to maintain a road is not suspended during a period of extraordinary traffic, however much the road may be injured or affected. The authority must make all reasonable efforts to keep it going, and enable it to carry the traffic, both ordinary and extraordinary. Further, the authority should do its best to mitigate the ultimate damage by carrying out all such repairs, whether permanent or temporary, and neglect in this connection may expose the authority to the risk of a finding that the damage of which they complain is attributable, wholly or in part, to their own default.

Upon completion of the extraordinary traffic it devolves upon the highway authority to thoroughly repair the damage or reinstate the road. The whole cost incurred is then to be made up, and the extraordinary expenses arrived at. It will be recalled that the statute refers to extraordinary expenses having regard to the average expense of repairing not the particular road in question, but highways in the neighbourhood. The main object of this provision appears to be to eliminate the effects of inequalities in the ordinary traffic, and to ensure a broad survey of the situation being taken. The "highways in the neighbourhood" selected for comparison should obviously, be as nearly as possible similar to and subject to like conditions of traffic with that under consideration. This is not altogether an easy matter to determine, but it is no doubt practicable in most cases to make a reasonable selection, especially where a periodical census of traffic is taken.

The general practice which has been evolved from the various decisions of the Courts is to take the average cost for the five years preceding of maintaining the particular road concerned, and of like roads in the neighbourhood, and to deduct this from the actual cost incurred on the former during and immediately after completion of the extraordinary traffic.

To take the concrete example already cited, the total actual expense, excluding establishment charges, incurred by the highway authority during the period of about a year, over which the extraordinary traffic extended, was £332. The average annual cost per mile of repairing this road and of four other high-

ways in the neighbourhood was taken at £100 per mile, or £62 for the actual length in question. The amount recoverable and claimed on this basis was £270. It may be remarked that the actual average cost of maintenance of the several roads, as extracted, was considerably less than £100 per mile—in fact, under £60—while that of the special road concerned was £58; but, in order to be on the safe side, it was decided to state the average annual cost at under £100 per mile. The fact that it has been laid down in one important decision (*Ledbury Rural District Council v Codwall Park Quarries Company*) that "regard should be had to the fact (if it is a fact) that the ordinary expenditure on repairs has been rising," indicates that it is advisable to provide a reasonable margin in making the deduction for average cost of repairs.

Two other principles appear to have been established in this connection:—

(*a*) That due allowance should be made for the weather if bad when the traffic was led. It is not easy to arrive with any precision at an exact amount, but the additional cost of repairs of other roads during an especially inclement season will generally give a working basis, and here again it is advisable to take care to make a sufficient allowance.

(*b*) That a deduction should be made for betterment, "being the value of the extent to which the structure or general condition of the road is improved as a result of the repairs rendered necessary by the extraordinary traffic." The fact that the road was "granited," or widened, or provided with a thicker crust may be taken into account in this connection. This, again, is a difficult principle to apply in practice, and it appears that only an approximate estimate can be arrived at. In *Kent County Council v. Kent Coal Concessions*, the Court, having arrived at the sum by which the expense incurred in consequence of damage caused by the defendants' extraordinary traffic exceeded the normal cost of repairs, made a deduction of one-third from such sum on the ground that the road had been given a new life, from which the plaintiffs would derive benefit.

In the more recent cases, however, the application of the principle of betterment has been narrowed down, and the mere fact that, as an incident to carrying out only essential repairs, a road has been improved and given a longer life, does not appear to justify a deduction for betterment. In the Neath case referred to very deep ruts had been formed in the road, and these were filled up with strong stone ballast before the surface (limestone) metalling was put on. This certainly improved the foundation of the road in parts, but the only alternative was to make up the whole surface with limestone metalling, which would have considerably increased the cost. Further, the thorough coating of the whole length of road at one time will no doubt have the effect of reducing the cost of ordinary maintenance for a few years; but the special repairs carried out having been limited to the reinstatement of the surface with the same kind of material (without generally improved construction or widening), a claim in respect of betterment, although it was put forward by the contractor, does not appear to have been tenable.

(5) Procedure

The legal formalities in connection with a claim in respect of extraordinary traffic commence with the issue of the surveyor's certificate; but before this stage is reached it is advisable to enter into communication with all the parties concerned with the traffic. As soon as definite damage to the road is observed, the persons directly or indirectly conducting the traffic should be notified that it is intended to carry out necessary repairs; and, finally, on completion of the traffic, they should be informed that it is intended to forthwith thoroughly reinstate the road. If this informal procedure is adopted, the parties have no ground subsequently to complain that they were given no opportunity of anticipating a claim or of checking the extent or the reasonableness of the repairs executed, and although there is no legal obligation to give the information indicated, there is no doubt that the course suggested is a fair and safe one, and that its adoption will carry due weight at the trial.

The Locomotives Act of 1898 enacts that "Proceedings for the recovery of any expenses . . . shall be commenced within twelve months of the time at which the damage has been done, or, where the damage is the consequence of any particular building, contract or work extending over a long period, shall be commenced not later than six months after the completion of the contract or work." The right given to commence proceedings within six months after the completion of a contract or work does not cut down the right given by the earlier parts of the section, and in these cases the action will be in time if commenced either within six months of the completion of the contract work or within twelve months of the time at which the damage was done. With regard to the completion of a contract, it has been held that this means "constructional completion" and not "contractual completion," which latter may run to the expiration of the maintenance period. It is also to be noted that the action will not lie until the expense claimed has been already incurred.

In the particular case mentioned various repairs were carried out from time to time as the extraordinary traffic proceeded, entries being duly made of all the items of labour and materials employed. As soon as possible after termination of the contract, the final reinstatement was proceeded with, and on completion the total expense incurred was made up. At the next meeting of the council the certificate of the surveyor was submitted, as follow:

"In the matter of 'The Highways and Locomotives (Amendment) Act, 1878,' and 'The Locomotive Act, 1898.'

To The Neath Urban District Council.

I, the undersigned David Morgan Jenkins, surveyor to the above-named highway authority, hereby report and certify that, having regard to the average expense of repairing highways in the neighbourhood, extraordinary expenses have been incurred by the said authority during the current financial year ending on the 8th day of November, 1913, in repairing the highway known as Upper Cimla-road, in the borough of Neath, having a total length of 5 furlongs, or thereabouts, by reason of the damage caused by excessive weights passing along the same and extraordinary traffic thereon—namely:—

The conveyance along the said highway of large quantities of building and engineering materials used in connection with and for the purpose of a new water service reservoir or storage tank, and other incidental works carried out by the Neath Rural District Council.

The contractor employed to carry out the said works for the said rural district council was ..... of .....

The haulage of the said materials was carried out by ..... of ..... traction and haulage engineers, as sub-contractor for and on behalf of the said .....

The vehicles used to convey the said materials were heavy waggons constructed to carry a load of some 5 tons each, drawn by steam traction engines.

The ordinary traffic on the said highway is light, consisting in the main of horse-drawn vehicles, such as farmers' and tradesmen's carts and private carriages.

During the said period an exceptional burden was imposed upon the said highway by the conveyance of the said materials over the same in the manner above described.

The cost of repairing the said highway during the said financial year has been £332 16s. 7d. exclusive of establishment charges, as against an average cost of under £100 per mile in respect of that highway and all other similar highways in the urban district during the preceding five years, showing an increased expenditure for the year in question on the said highway known as Upper Cimla-road of at least £270.

There was no other cause than the damage arising from the weight and traffic consequent upon the conveyance of the said building and engineering materials for the above-mentioned increased expenditure in repairing the said highway.

And I certify that such weight and traffic were excessive and extraordinary, and that, having regard to the average expense of repairing highways in the neighbourhood, extraordinary expenses have been incurred by you by reason of the damage caused by such weight and traffic.

Dated this thirtieth day of October, 1913.

DAVID MORGAN JENKINS.

Surveyor of the Neath Urban District Council."

A formal resolution of the council was passed in the general terms of the form given in the appendix to Lumley's book, which read as follows:

"The certificate of the council's surveyor, dated ..... having been read and considered, and

appearing thereby to the council that having regard to the average expense of repairing highways in the neighbourhood extraordinary expenses have been incurred by the council in repairing the highway known as [illegible] leading from the [illegible] railway station at [illegible] to [illegible] by reason of the damage caused by excessive weight doing the same and of extraordinary traffic thereon occasioned by the progress of certain vehicles employed in the new quarrying and other works recently established at [illegible] by the Welsh Granite Company Limited in the [illegible] railway station to the [illegible] of such works. It is resolved that the clerk to the council be and he is hereby authorised and directed to apply to and attend before the justices in petty sessions at the next hearing of applications for proceedings under the Act of 1878 for recovering the amount of such expenses from the corporation, person or persons by or in consequence of whose extraordinary weight or traffic the same have been occasioned and for such purpose to retain counsel and take all such other steps as he may consider desirable. And that the common seal of the council be affixed to a copy of this resolution."

The town clerk thereupon made broad application to the employer. He contended that the contractor had agreed to pay a sum named towards the additional expense incurred by the council on repairing the highway in question, at the same time [illegible] a copy of the [illegible] certificate and inviting amicable settlement of the claim. None of them, however, made any proposal or suggested entering into the composition agreement provided for by the Act of 1878. An action was consequently commenced in the High Court, well within the prescribed period of six months from the completion of the contract work, and the employers, the contractor and sub-contractor were joined as defendants, but on hearing of the issue of the writ and without waiting for its actual service, the contractor made overtures to the council and a satisfactory settlement was effected.

The legal procedure to be adopted is fully outlined in Lailey's book, and very useful hints are given as to the preparation of the case. It is [illegible] the importance of keeping a road ledger, in which all costs of repair and maintenance of every road in a district are entered and made up each year, cannot be too strongly emphasised.

DEATH OF PROFESSOR HENRY ROBINSON.

We deeply regret to announce the death, which occurred on the 29th ult., at his residence at Wavertree, N.W., of Prof. Henry Robinson, the well-known consulting engineer.

Prof. Robinson, who was seventy-eight years of age, was in 1850 a student in the engineering department of King's College, London, of which he became a scholar and associate after obtaining prizes in various subjects. He then joined the staff of Sir William Armstrong at Elswick, after which he commenced practice as a civil and consulting engineer at Westminster. For nearly half a century he was engaged in designing and carrying out many important railway, water supply, sewerage, foreshore protection, hydraulic, electric lighting, piers, mooring and other works. He took an active part in the distribution of energy in towns by hydraulic power, compressed air, and electricity, and designed and carried out at Hull the first public hydraulic-power scheme in the kingdom, described by him in a paper read before the Institution of Civil Engineers. He was for twenty-two years Professor of Civil Engineering at King's College, retiring in 1900, when the distinction of Emeritus Professor was conferred upon him.

Prof. Robinson was a member of the Institutions of Civil, Mechanical, and Electrical Engineers; a Fellow of King's College, the Surveyors' Institution, Fellow and Member of Council of the Royal Sanitary Institute, and was president of the Engineering and Architectural Sections at several of its congresses; an hon. member of the Institution of Municipal and County Engineers; and past-president of the Society of Engineers. He was the author of "Sewerage and Sewage Disposal," and "Hydraulic Power and Machinery," both of which have passed through several editions, and of a very large number of papers and articles read before scientific bodies, and contributed to the technical press.

ISOLATION HOSPITAL ACCOMMODATION IN CORNWALL.

At a recent meeting of the Sanitary Committee of Cornwall County Council it was reported that the Local Government Board had intimated that as a result of visits recently made by their inspector to certain districts in Cornwall where [illegible] the amount of hospital accommodation available throughout the county for the isolation of persons [illegible] was [illegible] rently unprovided with adequate and satisfactory [illegible] serious, and it was highly important that isolation hospital accommodation should be available for every district in the county. The board understood negotiations were proceeding between several authorities in the county with a view to the joint provi- [illegible] board, however, that the accommodation for small-pox and other infectious diseases required for the districts in question and other areas in the county would be best provided by the county council under a general scheme. It might be found practicable in [illegible]

Dr. Clarke, the acting county medical officer, reported that the isolation hospitals in the county, excluding small-pox, were provided in nine districts, thirty-three districts being unprovided. As the district councils had for the most part failed to provide the necessary accommodation, the Local Government Board, by their letter, made the county council equally or more responsible. The county council must now consider themselves responsible for taking measures to isolate any infectious diseases that occurred in their county in districts unprovided with isolation hospitals. It was unlikely that the Local Government Board would take any drastic action in the matter of ordinary isolation hospitals owing to the enormous expenses entailed. To satisfy the requirements of the Local Government Board £20,000 would not be too much as regarded hospitals, as they refused to lend money on ordinary temporary hospitals. About nine hospitals would be necessary. It would be possible for the district councils to [illegible] than could be done by the county council, because they could erect temporary buildings out of current expenses. At present cerebro spinal meningitis, or spotted fever, was causing difficulty in some dis- [illegible] The county council could threaten that if the district councils did not make provision for isolation hospitals it would be necessary for the county council to do so. The position the Local Government Board took up was that local government was on its trial, and if the county councils failed to act more power would be taken from Parliament by the Local Government Board. He was afraid the Local Government Board would then become an autocratic authority and pay little regard to the desires of local authorities.

The appointment of a committee to inquire into the matter was agreed upon.

Deptford Slipper Baths.—In our description last week of these buildings we omitted to state that Messrs. A. C. W. Hobman & Co., Limited, South Bermondsey, S.E., are supplying the artificial stone dressings and asphalt for the damp-course on the roofs.

Expensive Building Material. The greatly increased cost of building materials is shown in the fact that, whereas the cost of timber required for a labourer's cottage was £28 10s. before the war, it is now £42 10s. This was the price mentioned at a meeting of the Eastbourne No. 3 Rural District Council.

Bridge Building in Middlesex.—At their last meeting Middlesex County Council approved plans of new bridges on the Great West road (A 4) at Osterley Park over the Hounslow and Metropolitan Railways, (2) at Syon Lane over the London and South-Western Railway. It was also agreed that White Bridge, Brentford, should be maintained as a county bridge after it has been conveyed to the county council by His Majesty's Office of Works and has been rebuilt.

Institution of Municipal and County Engineers.

MEETINGS IN LONDON AND THE PROVINCES.

No fewer than four district meetings of the Institution of Municipal and County Engineers were held last week-end, and we append reports of the several gatherings, two of which took place at Westminster, one at Cardiff, and the other at Taunton.

SOUTH-WESTERN DISTRICT MEETING AT TAUNTON.

A successful meeting of the South-Western District of the Institution of Municipal and County Engineers was held at Taunton on Saturday. Those present included Messrs. Samuel Hutton (Exmouth), W. P. Robinson (Devon County), W. H. Chowins (Burnham), C. Oliver Baines (Paignton), J. Siddalls (Tiverton), Reginald Stephens (Ilminster), G. Ponsford (Exmouth), Edward Stead (Somerset County), Francis Parr (Bridgwater), F. W. Jones (Frome), F. Folland (Somerset County), W. A. Collins (Bridgwater Rural), Geo. Alves (Glastonbury), P. F. Spiller (Devon County), D. Edwards (hon. district secretary, Taunton), members; Councillor J. C. Lane (Taunton), A. J. Mildon (Tavistock), R. N. Finch, F. H. Tomes and J. H. Westlake (Taunton), and Charles Durie (Williton Rural), visitors. The arrangements for the day were ably carried out by the hon. district secretary, who left nothing wanting for the comfort and convenience of the party.

The Mayor, who was supported by the deputy-mayor (Alderman F. W. Penny), extended a cordial welcome to the members. His Worship said he trusted the gathering would be productive of good to the members and different corporations represented, and that all present would spend a profitable and enjoyable time.

Mr. F. Parr (Bridgwater), who was elected to the chair in the absence of the district chairman, Mr. James Paton, of Plymouth, moved a hearty vote of thanks to his Worship for his kind reception. They all appreciated coming to a town like Taunton, where so many good public works had been carried out. Both young and old could learn something, and they all ought to endeavour to gain as much knowledge as they possibly could from what Taunton could show them.

Mr. S. Hutton (Exmouth) seconded the vote of thanks, which was supported by Mr. J. Siddalls (Tiverton), and carried with acclamation.

The Mayor, having acknowledged the compliment, subsequently left the chair, and the business of the meeting was proceeded with.

The hon. district secretary, Mr. D. Edwards, Assoc.M.Inst.C.E., borough engineer and surveyor of Taunton, then read communications of apology for absence from Messrs. Jas. Paton (Plymouth), S. F. Churchward (Dawlish), W. North (Honiton), E. Y. Saunders (Barnstaple), H. A. Garrett (Torquay), L. D. Thompson (county surveyor, Cornwall), and T. Moulding (Exeter).

ELECTION OF EXECUTIVE COMMITTEE.

The following gentlemen were elected on the Executive Committee: Cornwall—Messrs. L. D. Thompson and E. D. Groves (St. Austell); Devon—Messrs. H. A. Garrett (Torquay), S. Hutton (Exmouth, J. Siddalls (Tiverton), and W. P. Robinson (Devon County); Somerset—Messrs. F. W. Jones (Frome), F. Parr (Bridgwater), W. A. Collins (Bridgwater Rural), and R. Stevens (Chard Rural); Dorset—Messrs. S. J. Harris (Weymouth) and F. H. McDonnett (Lyme Regis).

"SWEATING WAGES."

Mr. C. O. Baines (Paignton) introduced an important matter to surveyors generally. He said: "You will doubtless have noticed in the volumes of The Surveyor a list of duties, printed *in extenso*, relating to the appointment of surveyor to the Rural District Council of St. Germans, Cornwall, together with comments on this and other appointments of a similar nature. For a number of years the conditions of these positions have become more and more ridiculously restricted and onerous in character, with a corresponding degree of smallness in salary—in fact, sweating wages. I can use no other term, and it is indeed difficult adequately to describe one's feelings within the limits of polite language on coming across cases of this kind. I make no attack upon any individual or council, but I want this institution to bring what influence it can to bear upon the powers that be in order to improve matters for the members of our profession." Mr. Baines also referred to a case at Abingdon, which he considered was practically on all fours with that of St. Germans, and moved a resolution requesting the council to adopt some method of preventing a recurrence of such appointments.

Mr. S. Hutton (Exmouth) said he would second the motion to put a discussion in order. At the same time he was against anything which might tend to make the institution a kind of trade union.

After discussion, the motion, on being put, was lost, and Mr. Baines remarked: Very well, if you rural gentlemen will not help yourselves it is your own fault.

THE CANVASSING QUESTION.

Mr. Hutton brought up the question of the methods adopted by certain districts in the North of canvassing for votes for representation on the council of the institution, and proposed the following resolution: "That this meeting of the South-Western District of the Institution of Municipal and County Engineers strongly protests against canvassing for seats on the council either by person or proxy, and especially condemns the methods adopted by Messrs. J. S. Brodie and A. W. Bradley in issuing a circular canvassing for votes for persons, and that the council of the institution be asked to take such steps as are necessary to prevent a recurrence of such methods." He pointed out that such methods were unfair to such districts as the South Wales and South-Western Districts, inasmuch as the number of members was very much less than those in the populous areas of the North.

Mr. C. O. Baines (Paignton) seconded the motion; but an amendment was moved by Mr. W. P. Robinson (Devon) and seconded by Mr. J. Siddalls (Tiverton): "That this South-Western District Committee object to the practice of canvassing, and asks the council to take such steps as are necessary to prevent a recurrence of the practice."

On being put the motion was carried.

HEAVY LOCOMOTIVE TRAFFIC.

Mr. W. P. Robinson remarked that a departmental committee had been appointed by the Government to consider the question of damage to roads by heavy locomotive traffic—a question particularly affecting rural districts. He noticed that the Eastern District of the institution had resolved that opinions of all other districts in the kingdom should be obtained as to what steps it was necessary to take. No doubt they would be receiving a letter from the institution shortly asking the opinion of the district, and he moved a resolution that the matter be referred to the committee of the South-Western district to consider the questions referred to the departmental committee recently appointed to deal with locomotive traffic, and that that committee be authorised to present such statements as they deem desirable to the council of the institution in order to ensure representative evidence being submitted to the departmental committee.

Mr. E. Stead seconded, and the motion was carried.

The following special committee was appointed, and will meet at Exeter shortly after Easter: The county surveyors of Somerset, Devon (No. 2 Division) and Cornwall, with the following urban and rural representatives: Urban—Messrs. Siddalls, Moulding, Jones, Parr, Harris and Groves; rural—Messrs. Millard, Collins, [illegible] third to be left to the chairman and secretary to appoint.

Mr. Baines suggested that the new surveyor for St. Germans be appointed. (Laughter.)

LUNCHEON.

At the invitation of the Mayor, the members and others partook of luncheon in the municipal hall, an excellent menu being provided.

After the repast a few toasts were honoured.

The first, "The King," was musically honoured.

"The Taunton Corporation" was submitted by Mr. F. Parr, who congratulated the town and its surveyor upon the attractive municipal buildings which had been erected, and various other works which had been carried out in recent years.

The Mayor, in reply, said that during the thirty years he had resided in the town great improvements had been carried out, and the credit was due to those gentlemen who had gone before and inaugurated the improvements, and to those to whom had been entrusted the plans of the improvements. The health of the borough was everything. They were very desirous of doing away with the many courts in Taunton, and to this end the town council had erected a batch of workmen's dwellings, which it was proposed to supplement by another block.

The Deputy Mayor (Alderman F. W. Penny) proposed "The Institution of Municipal and County Engineers," which, he said, was a sort of Brotherhood who put their stock of knowledge together to benefit the whole of the members. So far as Taunton was concerned, they were pleased that Mr. Edwards came there ten years ago—just about the time when he himself became a member of the corporation, and he had never regretted giving his vote for the appointment of so well-qualified a surveyor. Taunton had developed along the right lines, and he felt sure under the present officials it would go on and prosper.

The toast was responded to by Mr. Edward Stead, the county surveyor of Somerset, and Mr. J. Siddalls, borough surveyor of Tiverton.

A discussion on public baths—which will be reported in our next issue—followed. At the close of the proceedings the members were entertained to tea by the mayor.

SOUTH WALES DISTRICT MEETING AT CARDIFF.

Mr. W. Harpur, the district chairman, presided on Saturday last at a South Wales District meeting of the Institution of Municipal and County Engineers held at the City Hall, Cardiff, and at which there were present Messrs. H. A. Clarke (Briton Ferry), hon. district secretary, R. E. David (Llantrisant), F. M. Greenhill (Cardiff), W. L. Harpur (Brecon County), L. Holden (Cardiff), W. H. Hughes (Cardiff), D. M. Jenkins (Neath), D. R. Morgan (Cardiff), G. A. Phillips (Glamorgan County), J. J. Quirk (Brynmawr), H. C. Rimell (Cardiff), and E. Whitwell (Abersychan).

The Chairman, in welcoming the members, commented on the period which had elapsed since the last meeting of the district took place. The difficulty, he observed, was to get anyone to read a paper or to show them over works of interest.

ELECTION OF OFFICERS.

Mr. H. A. Clarke (Briton Ferry) was re-elected district secretary, Mr. G. A. Phillips (Glamorgan County) as district representative on the council, and Mr. W. Harpur (Cardiff) as district chairman.

The District Executive Committee was elected as follows: Glamorganshire—Messrs. D. M. Jenkins (Neath), J. C. Pardoe (Barry), F. Read (Gellygaer), and J. R. Heath (Swansea); Monmouthshire—Messrs. H. Tremelling (Newport) and E. Whitwell (Abersychan); Carmarthenshire—Mr. J. H. Montgomery (Llanelly); Breconshire—Messrs. H. L. Griffiths (Brecon), W. L. Harpur (Brecon County), and J. J. Quirk (Brynmawr); associate members—Messrs. D. L. Jones (Merthyr), G. H. Bell (Swansea), and I. F. Shellard (Newport).

Mr. D. M. Jenkins, borough engineer of Neath, next presented a paper entitled "Notes on Extraordinary Traffic on Highways," which appears on another page of this issue. Pressure of space compels us to hold over until next week the report of the discussion which followed.

Before the close of the meeting a vote of condolence was passed with Mr. R. H. Wyrill, the borough engineer of Swansea, in the loss of his wife—reported in last week's Surveyor. It was also decided to forward an expression of the members' sympathy with Mr. G. Bell, who was recently compelled, owing to a breakdown in health, to relinquish his appointment as borough surveyor of Swansea. Mr. Bell, said the chairman, Mr. Harpur, in putting the motion, was a man of sterling character and great ability, and they were all sorry that he had been obliged to give up work.

METROPOLITAN DISTRICT MEETING AT WESTMINSTER.

A meeting of the Metropolitan District was held on Friday night at the offices of the institution, 92 Victoria-street, Mr. H. Percy Boulnois, in the absence of the district chairman, Mr. J. Patten Barber, being voted to the chair. The members present were: Messrs. O. Cattlin (Holborn), T. W. A. Hayward (Battersea), C. Chambers Smith (Westminster), W. F. Loveday (Stoke Newington), P. G. Killick (Finsbury), O. E. Winter (Hampstead) and N. Scorgie (Hackney, hon. district secretary).

THE QUESTION OF A CIRCULAR.

Mr. Scorgie stated that he had received from the council of the institution a letter stating that their attention had been drawn to the practice apparently adopted in some districts of circularising members of the district with regard to supporting certain candidates for election as ordinary members of the council. In view of the fact that the representation of each district was secured by the election of district representatives as ordinary members of the council, the council considered the practice of issuing such circulars as unnecessary and undesirable.

Mr. Hayward said he hoped they would write to the council stating that they heartily approved the action they had taken in this matter. It was, he thought, a most undesirable thing that circulars should be sent round canvassing for votes. He moved that they approve the action of the council.

Mr. Killick seconded.

Mr. Scorgie remarked that the action referred to did not affect this district one iota, for they had not decided to circularise. He thought it would be sufficient if they received the letter from the council.

Mr. Hayward said his point was this: He did not object to a district doing what they pleased in their own district, but he considered it was grossly unfair for a district to select a number of names and ask their members to vote for them *en bloc*. Why should one district strive to get all the representation at the expense of others?

Mr. Chambers Smith supported the view of Mr. Scorgie. The North Country members suffered a good deal of soreness because they considered they were not properly represented. It was the same in Ireland and Scotland, and the circular represented an effort to set things right.

Mr. Scorgie observed that one effect of the circular complained of was that the voting exceeded anything in the history of the institution.

Mr. Hayward said he did not think that was known.

Mr. Scorgie: You may take it from me.

Eventually the proposition of Mr. Hayward was carried by five votes to two.

DISTRICT CHAIRMAN.

Mr. J. Patten Barber, district chairman, wrote asking that his name should not be proposed as district chairman. The district, he added, would be better served by one who had more time at his disposal and more liberty than he had.

Upon the proposition of Mr. Hayward a cordial vote of thanks was passed to Mr. Patten Barber for his services, and it was agreed to approach Mr. G. W. Humphreys, chief engineer to the London County Council, on the subject of filling the vacant office.

HON. DISTRICT SECRETARY.

Mr. Scorgie was unanimously re-elected district secretary, and thanked for his past services.

DISTRICT REPRESENTATIVE.

Mr. O. E. Winter was re-elected district representative.

EXECUTIVE COMMITTEE.

The election of the District Executive Committee was postponed to the next meeting of the district.

The question of holding a series of winter meetings combined with social evenings was referred to the Executive Committee to prepare a synopsis of subjects for discussion; but it was definitely arranged, upon the proposition of Mr. Winter, to hold a meeting on April 30th, at 7.30, for the discussion of heavy motor traffic and the roads, which is now under the consideration of a Government Committee, invitations to be issued to members in Greater London.

SOUTH-EASTERN DISTRICT MEETING AT WESTMINSTER.

A South-Eastern District meeting was held on Friday evening at the offices of the institution, 92 Victoria-street, Westminster. In the absence of the district chairman, Mr. A. Dryland, owing to illness, Mr. A. E. Prescott (borough engineer of Eastbourne) was voted to the chair. The members present (including the chairman) were Messrs. J. W. Redfern (Gillingham), C. Chambers Smith (Westminster), R. Chart, junr. (Croydon), A. H. Quick (Thornton Heath), H. F. Chapman (Kent), F. Wilkinson (Wimbledon),

and H. W. Bowen (West Sussex, hon. district secretary).

DISTRICT CHAIRMAN.

The chairman stated that he had received from Mr. Dryland a letter expressing a wish to be relieved of the duties of district chairman by somebody who could give more time to the work than he was able to. He had replied asking Mr. Dryland to reconsider his decision, and had so far not received an answer.

Mr. H. T. Chapman nominated Mr. Dryland as district chairman, and Mr. Prescott having seconded the proposition, it was carried *nem. con.*

DISTRICT REPRESENTATIVE.

Mr. F. Wilkinson proposed the nomination of Mr. H. W. Bowen as district representative.

Some discussion, initiated by Mr. R. Chart, took place on the subject of changing the district representative so as to give as many members as possible experience of the office. Mr. J. W. Redfern thought it would be a mistake to change the representative every year, and the chairman agreed with this view, because it took a certain amount of time for the gentleman to learn the duties. Mr. Wilkinson also thought a year rather a short time to hold the office. After further discussion the nomination of Mr. Bowen was agreed to unanimously.

DISTRICT SECRETARY.

Mr. Bowen (who returned thanks for his nomination as district representative) having expressed a wish to retire from the office of hon. district secretary owing to pressure of work,

The chairman nominated Mr. J. W. Redfern.

Mr. Chart seconded, and the motion was carried.

EXECUTIVE COMMITTEE.

The following gentlemen were nominated to the Executive Committee:

Kent: Messrs. F. Harris (Tonbridge), H. W. Longdin (Penge), H. T. Chapman (Kent) and S. Sills (Rochester).

Surrey: Messrs. J. H. Brierley (Richmond), W. H. Grieves (Sutton), R. M. Chart, junr. (Croydon), and F. Wilkinson (Wimbledon).

Sussex: Messrs. A. E. Prescott (Eastbourne), F. Roberts (Worthing), W. E. Wickham (East Grinstead) and O. A. Bridge (Bognor).

VOTES OF THANKS.

Mr. Redfern proposed a vote of thanks to the district chairman (Mr. Dryland), the district representative (Mr. Harris), and the hon. secretary (Mr. Bowen) for the excellent service they had given during the past year.

Mr. Chapman seconded, and the chairman supported the proposition, remarking that they all appreciated the work that had been done on their behalf by the gentlemen named. They hoped the three gentlemen elected would work equally well during the ensuing year.

Mr. Bowen, in acknowledging the compliment, alluded to a circular letter that had been sent out from certain districts (and from the very advocates) the return of certain members to the council. He knew it was ought to condemn the [illegible] because he did not think it was right to [illegible] bers in this way.

The chairman said he had protested strongly against such procedure as he considered it most unfair. It [illegible] gentlemen [illegible] the council of the [illegible] was to hold a meeting and then [illegible] themselves.

Mr. Wilkinson proposed to leave [illegible] brought before the council at the next [illegible].

Mr. C. Chambers Smith stated that it had already been before the council.

The secretary (Mr. Robinson) confirmed this, and stated that the council had sent out a letter expressing disapproval of the issue of such a circular.

The vote was carried and the proceedings terminated.

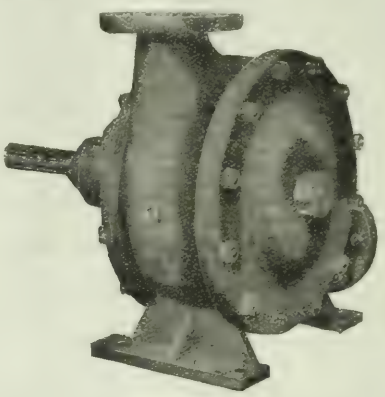
Corrosion of Iron and Steel Pipes.—At a meeting of the Institution of Sanitary Engineers to be held at Caxton Hall, Westminster, on Wednesday, the 14th inst., Mr. W. J. E. Binnie, M.Inst.C.E., will present a paper entitled "Corrosion of Iron and Steel Pipes, and the Protective Methods to be Adopted." The chair will be taken at 8 p.m. by Mr. A. P. I. Cotterell, the president.

ROTOPLUNGE SEWAGE PUMPS.

Among the most recent developments in pumping machinery for sewage or semi-solids, such as tar, oil, sludge, &c., is the Rotoplunge pump, which contains no valves of any shape or form, and which cuts up and disintegrates the sewage so that it can be handled properly.

The Rotoplunge pump overcomes in a very thorough fashion the common troubles of variation of head and loss of water through the formation of gas or air leakage, and, moreover, its action is entirely positive. We illustrate a sectional diagram showing the construction of the pump.

The pump consists of eight parts only: A the body



or casing, which has secured to it two covers, B and C. Inside is a rotor D, which is secured to the shaft; two piston castings (forming four pistons E and F working in cylinder bored in the rotor D. Two rollers, G and H, which work on the eccentric boss on the cover B. The suction side of the pump casing is separated from the delivery side by means of two division pieces of metal (J and K, Fig. 1), having only a clearance between their surfaces and that of the rotor; these are called shoes.

The action of the pump can be clearly followed by reference is made to the illustration.

The pump rotates in the direction indicated by the arrow (Fig. 1), and it will be clear, owing to the relative positions of the centre of the rotor shaft

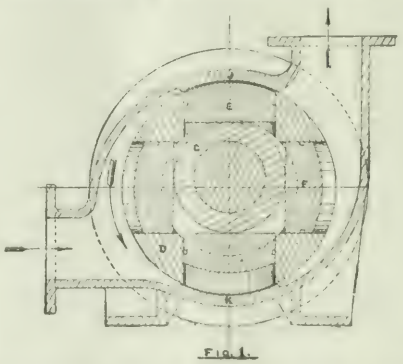


FIG. 1.

and eccentric boss that any cylinder [illegible] pass the upper shoe will have its piston in its extreme outward position. As the [illegible] cylinder moves down in a counter clockwise direction, its piston will move inwards, as shown by the other cylinder on the left-hand side in Fig. 1, until in its lower position the piston will be in its extreme inward position. The result of this action is that as the cylinders pass the portion of the working chamber which connects with the inlet pipe they draw in charges, which are nearly trapped in the cylinder as pass the lower shoe.

On the other side of the vertical centre line the pistons move outwards and expel their charges into the discharge pipe, finally reaching their extreme

ROYAL COMMISSION ON SEWAGE DISPOSAL.

ISSUE OF NINTH AND FINAL REPORTS.

[The Ninth and Final Reports of the Royal Commission on Sewage Disposal were issued on Wednesday, and the Final Report is reproduced herewith practically in extenso. Included in the Final Report is a summary of the conclusions and recommendations contained in the Ninth Report, which will be dealt with in detail in these pages in a subsequent issue.]

In this our Final Report we recapitulate briefly the main conclusions at which we have arrived as the result of an inquiry which has extended over a period of sixteen years.

Of the nine reports which we have issued, four deal mainly with the purification of domestic sewage discharging into streams (Interim, Second, Fifth, and Eighth Reports); two with the discharge of sewage into tidal waters (Fourth and Seventh Reports); and three with the discharge of manufacturing effluents (Third, Sixth and Ninth Reports).

Our Fourth, Sixth and Seventh Reports relate to investigations of a somewhat special nature which we were requested to undertake with a view to suggesting a solution of particular problems which had arisen. We considered that the conclusions at which we arrived were of sufficient general importance to warrant us in dealing with them as part of our inquiry.

The subject matter of our Fourth Report—the discharge of sewage into tidal waters—was brought specially to our notice by the Local Government Board, who had been moved to take action in consequence of a number of serious outbreaks of enteric fever, ascribed to the eating of shellfish obtained from sewage-polluted water.

Following on our recommendations the shellfish owners agreed to close sewage-polluted layings, and [illegible] to consume [illegible] other articles of diet than they were before the time of our inquiry. But no general recommendations for securing [illegible] and effective supervision and control, both of sewage outfalls and shellfish beds, have not yet been adopted.

Our Sixth Report was a special report on the purification of distillery waste. The investigation of this question was pressed upon us by representatives of the Scottish malt distillery industry, who found themselves unable to comply with the demands made by riparian owners for the protection of the salmon fishery.

As the result of our experimental work, a plant was erected for the purification of distillery waste, which, during the past few years, has been proved capable of producing at reasonable cost an effluent which is not injurious to fish, and other similar plants are in process of erection.

The work in connection with our Seventh Report was undertaken at the request of the Local Government Board for Ireland.

A very serious nuisance, due to the decay of seaweed, had arisen in Belfast Lough, into which the sewage of Belfast was discharged. As it appeared that the growth of the weed was encouraged by sewage pollution, a costly scheme for the complete purification of Belfast sewage was submitted by the corporation to the Local Government Board. Doubts having been expressed as to whether by these means the evil would be remedied and its occurrence prevented, the Local Government Board, knowing that we had had some evidence on the subject in connection with our inquiry into the pollution of tidal waters, desired to know whether we proposed to investigate further the best and least expensive means of treating sewage so as to avoid similar nuisances.

We considered the matter was one of sufficient general importance to justify us in making inquiry in regard to it.

We have recalled the particular circumstances in which these three reports were written because they embodied the results of special investigations which, in the absence of a permanent authority for dealing with such questions, we felt bound to undertake. They form, however, an integral part of our general inquiry.

THE NINE REPORTS SUMMARISED.

We append a summary of all our reports, in chronological order.

INTERIM REPORT. Cd. 685 [1901].

Our First Report was of an interim character and contained the following conclusions:—

(1) No land is entirely useless for purification of sewage, "but in the case of stiff clay and peat lands the power to purify sewage seems to depend on the depth of the top soil."

"There are, of course, numerous gradations in the depths of the top soil which are met with in Nature, and it is not easy to draw the line between lands which contain a sufficient depth to purify their use and lands which do not.

"We are, however, forced to conclude that peat and stiff clay lands are generally unsuitable for the purification of sewage, that their use for this purpose is always attended with difficulty, and that where the depth of top soil is very small, say 6 in. or less, the area of such lands which would be required for effluent purification would in certain cases be so great as to render land treatment impracticable.

(2) ". . . we are satisfied that it is practicable to produce by artificial processes alone either from sewage or from certain mixtures of sewage and trade refuse such, for example, as are met with at Leeds [illegible] effluents which will not putrefy, would be classed as good according to ordinary chemical standards, and which might be discharged into a stream without fear of creating a nuisance.

"We think, therefore, that there are cases in which the Local Government Board would be justified in [illegible] under proper safeguards, the present rule as regards the application of sewage to land.

(3) " . . . as a result of a large number of examinations of effluents from sewage farms and from artificial processes we find that while in the case of effluents from land of a kind suitable for the purification of sewage there are fewer micro-organisms than in the effluents from most artificial processes, yet both classes of effluents usually contain large numbers of organisms, many of which appear to be of intestinal derivation, and some of which are of a kind liable, under certain circumstances at least, to give rise to disease.

"We are of opinion, therefore, that such effluents must be regarded as potentially dangerous, and we are considering whether means are available and practicable for eliminating or destroying such organisms, or, at least, those giving rise to infectious diseases.

(4) "It is of the utmost importance that the simplest possible means should be provided for adequately protecting all our rivers," . . . and "it will be desirable, probably for some time to come, that

scientific experiments should be carried on in order to ascertain all the real dangers of pollution, against which they should be protected.

"In the present state of knowledge, and especially of bacteriology, it is difficult to estimate these dangers with any accuracy, and it seems quite possible that they should be either exaggerated or undervalued according to the predisposition of those who have to deal with them. An authority, guided by medical considerations, might not unnaturally be inclined to insist on a degree of purity which may ultimately prove in certain cases to be uncalled for, while another authority, with its mind fixed upon economy, might shrink from taking essential precautions.

". . . the general protection of our rivers is a matter of such grave concern as to demand the creation of a separate commission, or a new department of the Local Government Board, which shall be a supreme rivers authority, dealing with matters relating to rivers and their purification, and which, when appeal is made to them, shall have power to take action in cases where the local authorities have failed to do so."

SECOND REPORT. Cd. 1178 [1902]

Our Second Report was a formal document covering certain scientific papers which were presented as an appendix to that report.

THIRD REPORT. Cd. 1486 [1903]

In our Third Report we dealt with the relations between local authorities and manufacturers in regard to the disposal of manufacturing effluents. We found that the present state of the law was most unsatisfactory, that the attitude of local authorities towards manufacturers had differed widely, and that many manufacturers were seriously handicapped. Our investigations showed that purification of trade effluents by the local authority is in the great majority of cases practicable; purification by the manufacturer is in some cases difficult, if not impracticable; while purification by the manufacturer would generally be more costly than purification by the local authority.

It also appeared that the local authorities, as well as the manufacturers, were of opinion that there should be laid on the local authority a distinct obligation to receive trade effluents.

Our recommendations on this point were as follows:—

"We are, therefore, of opinion that the law should be altered so as to make it the duty of the local authority to provide such sewers as are necessary to carry trade effluents as well as domestic sewage, and that the manufacturer should be given the right, subject to the observance of certain safeguards, to discharge trade effluents into the sewers of the local authority if he wishes to do so.

"We do not think it possible to provide, by direct enactment, what these safeguards should be. In each district it would probably be desirable that the local authority should frame regulations which should be subject to confirmation by a central authority. In most cases, however, these regulations could provide definite standards for the different manufacturers as regards preliminary treatment, and it appears from the evidence that manufacturers would much prefer to have standards to work to.

"Power to vary the standards or to dispense with them altogether in special cases would be necessary.

"Although the duty of receiving trade effluents should, we think, be imposed on the local authority, cases may arise in which they should be wholly or partially relieved of it.

"For example, we find that in some instances the effluent discharge from the manufactory is of a composite character, the greater part of which might with advantage be easily dealt with by the manufacturer if it were kept separate. In such cases we think the manufacturer would generally be willing to adopt this course, but provision is necessary for those cases in which the local authority and manufacturer could not agree.

"Further, although we have received no conclusive evidence to show that there are trade effluents which could not be purified by the local authority, we do not deny the possibility of such cases arising.

"And it is possible that in some cases, as, for example, of a large manufactory being newly established in a small district, it might be necessary to relieve the authority of the obligation to treat the trade effluent, or to enable them to exact some special contribution from the manufacturer, not only for the cost of treatment, but also towards capital expenditure.

"It is obvious, therefore, that some tribunal will be required for settling differences between the local authority and the manufacturer, and for relieving the local authority in exceptional cases, either wholly or partially, of their obligation to provide sewers and disposal works of sufficient capacity for trade effluents as well as ordinary sewage.

"We are of opinion that generally no special charge should be made on the manufacturer in those cases in which the regulations as to preliminary treatment are complied with.*

"As we have already stated, it is desirable that, wherever practicable, some preliminary treatment should be carried out by the manufacturer.

"But where the manufacturer is unable to comply with these regulations, we consider that the local authority should be empowered to make a special charge.

"Power should also be granted to make a special charge, even when preliminary treatment is adopted, where there are exceptional circumstances as regards volume, quality, or otherwise."

SETTLEMENT OF DIFFERENCES BETWEEN LOCAL AUTHORITIES AND MANUFACTURERS

The chief questions upon which we considered that differences might arise were:—

(1) The refusal of a local authority to allow a particular trade effluent to enter their sewers.
(2) The refusal of a local authority to construct or enlarge sewers for the purpose of a particular manufactory.
(3) The question of varying general regulations as to preliminary treatment by the manufacturer.
(4) The amount of the special charge to be imposed on the manufacturer.
(5) The removal of sludge.

The balance of opinion we found to be strongly in favour of the view that for the settlement of these questions it is necessary to constitute a central board possessing adequate technical knowledge, such as the Supreme Rivers Authority which we recommended in our Interim Report.

As regards this matter we reported as follows:—

"We have been struck by the large sums which have been expended in appeals to courts, but, apart from the question of expense, we are strongly of opinion that the ordinary courts are not suitable for the determination of these questions, and we venture to think that the judgment of the Master of the Rolls in the case of *Attorney-General* v. *Whitmore*, to which we have already referred, clearly supports this view. He comments that 'the evidence was very complicated, the expert witnesses who were called not only giving evidence quite inconsistent with one another, but some of them giving evidence in cross-examination which was quite inconsistent with what they said in examination in chief,' might apply to many similar cases.

"The scientific questions to be solved would in most instances be capable of actual determination by a properly equipped central authority, and there can be little doubt that such direct proof would be far less costly than the process of endeavouring to arrive at the truth through the evidence of 'expert' witnesses in a court of law.

"Moreover, the matters to be determined include not only scientific questions on which witnesses may be expected to differ, but also considerations of an administrative character which should more properly be dealt with by a Government Department.

"Further, we find that a central authority possessing adequate technical knowledge would command the confidence of local authorities and manufacturers.

"In our opinion a properly equipped central authority is essential, and we unhesitatingly recommend the creation of such an authority.

* See, however, paragraph 10 of the Ninth Report, in which we stated, "Our own additional experience, and the further evidence which has been laid before us, indicate that it may be desirable that local authorities should have a general power to make a charge, provided that the charges were lower in the case of effluents which had been subjected to preliminary treatment in accordance with the regulations."

In the interests of [illegible] we consider that the trade of the country, we consider [illegible] the Board's experience that the changes in the law which we have mentioned [illegible] would be useful. But these changes would not involve any departure of such a kind from the present system of a central authority for the determination of differences between the local authority and the manufacturer.

In the settlement of these differences by [illegible] the ordinary course of [illegible] before arbitration with the [illegible] to be avoided.

We also recommended that [illegible] the protection of rivers rivers boards should be [illegible] for other parts of the country similar [illegible] which already exist in Lancashire and Yorkshire, and that these boards should be empowered to determine, subject to appeal to the central authority, certain of the differences between local authorities and manufacturers.

We further advised that it should be the duty of rivers boards to report public water supplies, and to report to the central authority any cases of dangerous pollution of such supplies which they may detect, and that the central authority should be empowered after due inquiry to require the purveyors of the water to [illegible] as, in the opinion of the central authority, were [illegible] ing the danger.

We also recommended that the central authority might, with the aid of the rivers boards, very properly collect such information as is available [illegible] by pumping from mines, and in regard to the abstraction of water from one district for the supply of another district, to the detriment of the water supply of the district from which the water was taken. We considered that the collection of such information should precede the consideration of the question whether legislative interference in regard to these matters is desirable.

We may here add [1914] that it appears to us desirable that a rivers board should have [illegible] *stands* to appeal to [illegible] in regard to any reference affecting [illegible] district.

FOURTH REPORT—Cd. 1884 [1905].

In our Fourth Report we dealt with the question of tidal waters, with special reference to the contamination of shellfish. We stated that

"Your Commissioners, in framing the terms of the order of reference to them, assumed that a considerable number of persons [illegible] were then ill [illegible] to be caused by the consumption of shellfish which had been exposed to sewage contamination; but in the present state of knowledge we do not think it possible to make an accurate numerical statement of any such alleged [illegible] the whole country.

"There can, however, be no doubt that the evil [illegible] and requires a remedy."

Our main recommendations in dealing with the evil was stated in the following terms:—

After considering and weighing the whole of the evidence, together with the results of our own investigations and local inquiries, we are strongly of opinion that the only way in which the evil can be effectively dealt with is by placing tidal waters under the jurisdiction of a competent authority, and conferring on that authority power to prevent the taking of shellfish for human consumption from any position in which they are liable to risk of dangerous contamination, and to enforce restrictions as regards pollution, and as regards waters, foreshores, pits, ponds, beds and layings in which shellfish are [illegible] stored, as and when required.

"For this purpose the powers of the authority must be elastic. The case of each river and estuary is a problem by itself, and it would not be practicable to fix by enactment any standard or standards which would be generally suitable to the widely different conditions of different cases. Moreover, as the conditions are shifting in character, it is necessary to provide some permanent machinery by which restrictions can be varied."

After considering various alternatives [illegible] that:—

We [illegible] River Boards should be [illegible] whom to vest the local control which we are now [illegible] over tidal waters (estuarial and other), and it is desirable that [illegible] for sanitary purposes. There are [illegible] the sanitary qualities [illegible] alternative to giving them jurisdiction would seem to be to [illegible] central department."

We [illegible]

That the necessary powers should be vested over the pollution of tidal waters, and over waters, foreshores, pits, ponds, beds, and layings where shellfish are grown, fattened or stored, should be vested in the Rivers Boards, subject to appeal to a central authority."

In the [illegible] we dealt with the procedure which the rivers boards and central authority should follow. We also dealt with the question of the means which should be adopted for avoiding danger from the consumption of foreign shellfish.

As regards [illegible] we recommended that [illegible] of shellfish should be guarded against in the case of discharge of sewage into tidal [illegible] we made recommendations dealing with [illegible] matters.

FIFTH REPORT—Cd. 2585 [1905].

The Fifth Report deals chiefly with the relative merits of the various methods available for the [illegible]

[illegible]

Our conclusions are summarised as follows:

"It is practicable to purify [illegible] of tidal waters by means of land treatment or by artificial filters, but [illegible] a central authority [illegible] the two processes.

"The [illegible] to be adopted in the case of [illegible] to purify a sewage [illegible] of sewage purification are, first, what degree of purification is required in the circumstances of that town, and of the river or stream into which its liquid refuse is to be discharged; and, secondly, how the degree of purification required can, in the particular case, [illegible]

[illegible]

"We find that it is generally desirable to remove from the sewage, by a preliminary process, a considerable proportion of the grit and suspended matters before attempting to purify the sewage on land or filters.

[illegible] TANKS.

"[illegible] quiescence is usually sufficient to produce a tank liquor fairly free from suspended solids, but, owing to the fact that [illegible] contains a larger proportion than others of solids that settle very slowly, no general rule can be laid down as to the necessary period of quiescence. With this form of treatment the deposit at the [illegible] be frequently removed [illegible]. The amount of settlement effected does not depend alone upon the period of [illegible] a number of other factors. If the tank liquor is to be treated upon filters of fine material, the period of flow should generally be from ten to fifteen [illegible] the tank should be cleaned out at least once a week.

SEPTIC TANKS.

"All the organic solids present in sewage are not digested by septic tanks, the actual amount of digestion varying with the character of the sewage, the size of the tanks relative to the volume treated, and the frequency of cleansing. With a domestic sewage, and tanks worked at a twenty-four hours' rate, the digestion is about 25 per cent.

"The liquor issuing from septic tanks is bacteriologically almost as impure as the sewage entering the tanks.

"Domestic sewage which has been passed through a septic tank is not more easily oxidised in its passage through filters than domestic sewage which has been subjected to chemical precipitation or simple sedimentation.

"No definite rules can be laid down as to how long a septic tank should be run without cleaning. In the case of small sewage works (serving populations of, say, 100 to 10,000 persons) the tanks should generally be allowed to run without cleaning so long as the suspended matter in the tank liquor shows no signs of affecting the filters injuriously. For larger works it would generally be advisable to run off small quantities of sludge at short intervals of time.

"The rate of flow through a septic tank is a matter in which the needs of each place require special consideration, but at few places should the sewage be allowed to take longer than twenty-four or less than twelve hours to flow through the tank. In no case should less than two tanks be provided, and they should be arranged so that, if necessary, one tank can be used alone.

"As regards digestion of sludge and quality of tank liquor, a closed tank possesses no advantages over an open tank. There is less risk of nuisance if the tank and the feed channels to the filters are covered in.

"By passing septic tank liquor through tanks of a size sufficient to hold about one-quarter of the day's flow, with the addition of from 2 to 3 grains of lime per gallon to the liquor, the suspended solids in the liquor are materially reduced, a considerably larger quantity of the liquor can be treated per cube yard of filter, and the offensive character of the liquor is largely destroyed.

CHEMICAL PRECIPITATION.

"In the case of sewages which contain certain trade waste, and strong sewages from water-closet towns, it is generally desirable to subject the sewage to some form of chemical treatment before attempting to oxidise the organic matter contained in it. In most cases careful chemical precipitation materially aids the deposition of the suspended solids, and facilitates subsequent filtration.

"No general rule can be stated with regard to the capacity of precipitation tanks. With continuous flow an eight hours' rate is usually sufficient to produce a fairly good tank liquor from a domestic sewage of average strength.

"If sewage is allowed to remain quiescent in the tank, two hours' settlement would usually suffice.

RELATIVE COST OF DIFFERENT TANK TREATMENTS.

"In the absence of special circumstances favouring a particular plan, it would appear that there is very little difference in annual cost between the various methods of tank treatment when taken in conjunction with the cost of subsequent filtration through percolating filters, assuming that the kind of filter adopted in each case is that which is best adapted to the particular tank treatment provided.

FILTERS.

"Within ordinary limits, the depth of a contact bed makes practically no difference to its efficiency per cube yard.

"We think that it would be generally inadvisable to construct contact beds of a greater depth than 6 ft., or of a less depth than 2 ft. 6 in.

"For practical purposes, and assuming good distribution, the same purification will be obtained from a given quantity of *coarse* material, whether it is arranged in the form of a deep or of a shallow percolating filter, if the volume of sewage liquor treated per cube yard be the same in each case.

"With regard to percolating filters of *fine* material, if the liquid to be purified were absolutely free from suspended and colloidal solids, and if thorough aëration could be maintained the statement just made for filters of coarse material might possibly hold good for filters of fine material also. In practice, however, these conditions can scarcely be maintained with large rates of flow, and we think that the greatest efficiency can be got out of a given quantity of *fine* material by arranging it in the form of a shallow filter rather than of a deep filter; but we are not in a position to make an exact quantitative statement as to the difference in efficiency of the two forms.

"The amount of sewage which can be purified per cube yard of contact bed or of percolating filter varies —within practical limits—nearly inversely as the strength of the liquor treated. This statement is based on the assumption that the size of the material of which the filter is composed is in each case suitable to the character of the liquor treated, and that the material is arranged at the proper depth to secure maximum efficiency.

"Taking into account the gradual loss of capacity of contact beds, a cubic yard of material arranged in the form of a percolating filter will generally treat about twice as much tank liquor as a cubic yard of material in a contact bed.

"In the case of sewage containing substances which have an inhibitory effect upon the activity of micro-organisms, the working power per cube yard of filter of either type may be more nearly equal. This point, however, is not clearly established.

"Percolating filters are better adapted to variations of flow than contact beds.

"Effluents from percolating filters are usually much better aërated than effluents from contact beds, and, apart from suspended solids, are of a more uniform character. On emptying a contact bed, the first flush is usually much more impure than the average effluent from the bed.

"The risk of nuisance from smell is greater with percolating filters than with contact beds.

"With percolating filters there is apt to be a nuisance from flies, especially with filters constructed of coarse filtering material. In the warmer months of the year such filters swarm with members of the *Psychodidæ*, which, though appearing to breed and develop in the filters, may usually be seen in large numbers on the walls of houses or buildings close to or on the works.

TREATMENT OF SEWAGE ON LAND.

"There is no essential distinction between effluents from land and effluents from artificially constructed filters.

"Effluents from those soils which are particularly well adapted for the purification of sewage contain only a very small quantity of unoxidised organic matter, and are usually of a higher class than effluents from artificial filters as at present constructed and used.

"Effluents from soils which are not well adapted for the purification of sewage may often be very impure.

SLUDGING OF MILL DAMS.

"In any case in which the Rivers Board should be of opinion that the sludging of a mill dam by turning the accumulated sludge into the stream would give rise to a nuisance, and that it would be financially practicable for the millowner to adopt some other method of cleansing the dam, the Rivers Board should be empowered, by notice, to direct the millowner not to turn the sludge into the stream.

"It should be provided that any millowner deeming himself aggrieved by such a direction might, within some fixed period, appeal to the central authority. The decision of the central authority should be final.

"Should any cases arise in which it is important that the sludge should not be turned into the stream, but in which the Rivers Board are of opinion that the cost of adopting any other method of cleansing the dam would be prohibitive to the millowner, we recommend that the Rivers Board should be empowered to represent the case to the central authority, and that the central authority should be empowered, after due inquiry, to direct that the sludge shall not be turned into the stream. If the central authority should be satisfied that the cost of adopting some other method of cleansing the dam would be greater than the millowner could be reasonably called upon to bear, they should be empowered to direct that a portion of the cost should be borne by the local authorities whose districts would be benefited.

EFFECT OF TRADE EFFLUENTS ON SEWAGE PURIFICATION.

"All the trade effluents of which we have had experience interfere with or retard processes of purification to some extent, but we are not aware of any case where the admixture of trade refuse makes it impracticable to purify the sewage upon land or by means of artificial processes, although in certain extreme cases special processes of preliminary treatment may be necessary.

NUISANCE FROM SMELL.

"All sewage works are liable at times to give off unpleasant smells; they should therefore be situated away from dwelling-houses wherever this is practicable.

"The nuisance is apt to be considerably greater where the sewage contains brewery refuse in any quan-

...but on the other hand, the presence of ... trade effluents may ... such matters tend to render the process ... less effective.

"The extent of the right of appeal ... not only on the character of the sewage ... also on the method of treatment adopted.

GENERAL OBSERVATIONS RELATING TO CHOICE OF A METHOD OF SEWAGE TREATMENT.

"The selection of a particular ... should depend primarily on local conditions.

"In a sufficient quantity of good land ... sewage can generally be purified ... an area, land treatment would usually be the ... method to adopt.

"In cases where ... the land ... would generally be ... provide artificial filters.

"Given certain conditions favourable to each process ... little difference in regard to cost between the different forms of land treatment ... ordered along with the ... of the ...

"Single contact will usually suffice to produce a good effluent where the sewage to be treated is weak, and there only after good preliminary treatment. For the purification of partially settled sewage ... but well, or after only partially settled ... average strength, if the ... a good effluent is required ... contact ... while at a sharp ... has to be treated ... contact is necessary unless the preliminary treatment is exceptionally good.

"In nearly every case a greater rate ... per cube yard can be adopted if the material is arranged in the form of a percolating ... than if used in contact beds. In many ... filtration three or four times ... or nearly double what it could be with ... beds.

"Where the liquor to be treated ... suspended matter it ... usually advisable ... filter, whether contact or percolating, with coarse filtering material. Where the preliminary ... effectively removed the greater part of the suspended matter ... less ... the filters.

STORM OVERFLOWS ON BRANCH SEWERS.

"Storm overflows on branch sewers should in most cases ... and should usually be set ... to come into operation until the flow in the branch sewer is several times the maximum normal dry-weather flow at the ... No general rule can be laid down as to the ... in these cases should occur in the branch sewer before ... allowed to pass away by the overflow ... by the Rivers Board, or in districts where there is no Rivers Board the county council, should have power to require the local authority to ... where in their opinion ... unpurified sewage to flow over them. The local authority should have the right to appeal to the central authority in any case in which they consider that the requirement of the Rivers Board ... unreasonable or impracticable of fulfilment.

"The general principle should be to prevent such an amount of unpurified sewage from passing over the overflow as would cause nuisance.

TREATMENT OF STORM-WATER SEWAGE AT THE WORKS.

"A general rule ... special tanks ... or more should be provided at the works ... to be used simply for the purpose of receiving the excess of storm water which cannot be properly passed through the ordinary tanks. As to the amount which may be properly passed through the ordinary tanks, our experience ... that ... from three ... the rate of flow through the ... tanks may usually be increased to about three times ... "normal" dry-weather rate without serious disadvantage.

"The overflow at the works should be made from these special tanks and should be arranged ... that it will not come into operation until the tanks are full.

"Special filters which are only to ... storm are not usually ... and should not be provided.

"Any extra quantity of sewage arriving at the works in storms, which has to be filtered, should be treated on the ordinary filters, which should be made sufficiently large for the purpose.

"As regards the size of the standard ..., the amount of storm-water sewage to be filtered and the arrangements generally for dealing with the storm sewage at the outfall works, the Rivers Board, or the ... council in areas where no Rivers Board have been established, should have similar power to that which we have proposed in regard to overflows on branch sewers, and the local authority should have a similar right of appeal to the central authority.

"In ... practice ... to provide ... to deal with ... of the daily dry-weather flow, and it will not be necessary to provide ... more than ... the normal dry-weather flow.

"Under the ... storm sewage arriving at the outfall works would be ...

SEPARATE SYSTEMS OF DRAINAGE.

"In ... a local authority ... adopt the separate system of drainage for the whole or any part of their district, they should apply to the central authority, and that authority should be empowered ... such powers as are required.

"As regards the powers that are required, the ... separate sewers are provided, the local authority ... separate drains, but the local Acts to which our attention has been drawn do not modify the powers of the local authority under the general law in regard to by-laws as to the drainage of houses. Moreover, the powers of the local authority should not necessarily ...

"A ... drains should fall on the local authority, and there may be some instances in which it would be equitable that they should bear some portion of the additional ...

"The central authority should, therefore, have power to include in their Order such provisions for ... having regard to the local circumstances.

CONCLUSION.

"... duties of local authorities, and in view of the importance of not requiring a local authority to incur any further expenditure on sewage disposal than the circumstances of its area require we feel strongly ... local circumstances to be taken into account.

"We ... central authority should determine the nature of the tests which are to be applied for the purpose of standards, and that it should be made the duty of the Rivers Board, or of the county council in areas not under the jurisdiction of a Rivers Board, to determine from time to time, subject to appeal to the central authority, what standards should be adopted.

"In the ... it would be convenient that the central authority should prescribe one standard for all non-tidal waters in place of the existing statutory provisions. It would then rest with the Rivers Board or county council to fix, subject to appeal to the central authority, a higher or lower standard in any case in which they were of opinion that the circumstances required or justified a different standard.

"We ... that no action should ... to be brought in respect of damage alleged to be done by the discharge of an effluent which complies with the standard fixed for the water into which it is discharged, but that in such cases complaint should be made to the central authority, and, if a ... case is made out, that authority should ascertain whether the complaint is well founded, and should be empowered to fix a different standard if the circumstances are shown to require it.

"In cases where it is alleged that the effluent does not comply with the statutory standard, and that damage is caused by the discharge of such effluent, action should be brought in the ordinary courts.

"But any questions arising as to whether the effluent ... with the statutory standard, or as to whether ... damage has been caused by the discharge of the effluent in respect of which complaint is made, should be referred by the court to the central authority for determination. The costs of such determination should be borne by the parties to the action in such proportions as the court may determine.

Power should be conferred on the central authority to suspend from time to time the operation of

of supplying a large part of North Westmorland—an area comprising sixteen parishes—with water from one source, and last year a Local Government Board inquiry was held into a scheme for supplying the area from Blea Water Tarn, near Mardale, at an estimated cost of between £35,000 and £40,000. The council have now resolved that no further steps be taken in connection with the scheme until after the termination of the war. This decision is due to the greatly increased cost of materials and labour, and to the enhanced interest required upon borrowed money.

MISCELLANEOUS.

Middlesex C.C.—The wages of council roadmen receiving 36s. a week or less are to be increased by 2s. a week on their existing normal wage, the increase to date from March 1st last.

Paignton U.D.C.—The question of the repair of the sea wall at Preston has been under consideration owing to considerable damage which was recently sustained, and the council agreed that it would be preferable, instead of incurring the cost of the repairs, to proceed with the negotiations for the requisition of the beach, which was described as a possible valuable asset to the town.

Stoke-on-Trent T.C. — A committee has been appointed to consider the agreement with the Potteries Electric Traction Company for a renewal of the lease of the tramways.

BELGIUM TOWN PLANNING COMMITTEE.

Viscount Bryce, O.M., has consented to become president of the newly formed Belgium Town Planning Committee which has been constituted by the amalgamation of the various committees previously considering the question of the replanning of Belgium. The committee, which is under the patronage of the Belgian Government, has Mr. Raymond Unwin as chairman and Mr. Ewart G. Culpin as secretary.

Following upon the recent highly successful conference at the Guildhall, London, the next step will be the opening of a Belgian exhibition at University College, Gower-street, W.C. It is hoped that Lord Bryce will open the exhibition on April 6th, and it will remain open until the end of the month.

At the same time study circles of architects, lawyers, and others will be instituted for the consideration of the actual facts of town planning, but on the legal and technical sides; lectures and conferences will be held for municipal councillors and the general body of the public in order to educate them in these matters. University College has kindly provided studio and office accommodation.

Money is urgently needed to carry on the work, and may be addressed to the secretary at the School of Architecture, University College.

FOR OTHER ADVERTISEMENTS
See End of Paper.

URBAN DISTRICT COUNCIL OF HORNCASTLE.

ROAD MATERIAL.

The above Council invite Tenders for Supplying the following Road Material, viz.:—

390 tons (more or less) of X Granite.
270 tons (more or less) of XX Granite.
200 tons (more or less) of 2½-in. Slag.
80 tons (more or less) of ½-in. Clean Slag Chips.
20 tons (more or less) of Slag Dust.

To be delivered at Horncastle Station as and when required by the Council's Surveyor (the Contracts to be completed by 30th September next, and security for the due performance thereof must be given).

Small Samples to be sent to the Surveyor, Mr. F. Weeber, Foundry-street, Horncastle.

Forms of Tender can be obtained from the undersigned.

The Council do not bind themselves to accept the lowest or any Tender.

Sealed Tenders, marked "Road Material," must be delivered to me not later than 2 p.m. on Monday, 19th April next.

(By order)
R. W. CLITHEROW,
Clerk to the Council.

Court House, Horncastle.
March 30, 1915. (2,519)

PERSONAL.

Mr. J. C. Trounson has been appointed deputy borough surveyor of Plymouth.

Mr. William J. Cook, surveyor to the Aylesbury Rural District Council, has resigned.

Mr. T. Ingle, Colne, has been appointed highway surveyor to the Louth Rural District Council.

Mr. J. Pickup has been appointed building inspector to the Burnley Corporation in succession to Mr. T. Cross, deceased.

Mr. W. H. G. Browne, surveyor and inspector to the Bolsover Urban District Council, has been appointed supervising sanitary inspector at British Guiana.

Mr. J. G. Howard, assistant surveyor to the Berkhamsted Rural District Council, has been appointed surveyor and inspector to the Salcombe Urban District Council.

Mr. J. R. Hadfield, surveyor to the Berkhamsted Urban District Council, has received the congratulations of his council upon obtaining the diploma as an associate member of the Institution of Civil Engineers.

Mr. George D. Macniven, L.R.I.B.A., of the firm of Messrs. Greig, Fairbairn & Macniven, architects, has been appointed assistant architectural inspector to the Local Government Board for Scotland, under the Housing Acts, and more particularly in connection with the scheme for the housing of Admiralty employees at Rosyth.

Mr. F. W. Bricknell is recommended by the Works Committee of the Hull Corporation for the office of city engineer, in succession to Mr. A. E. White, who retired last year. Mr. Bricknell, who entered the service of the corporation thirty-eight years ago as a pupil, has since Mr. White retired acted as city engineer. The salary has been fixed at £750, with annual increases of £50, till the maximum is reached.

Mr. David M. Jenkins, Assoc.M.Inst.C.E., whose paper, "Notes on Extraordinary Traffic on Highways," read at last Saturday's district meeting of the Institution of Municipal and County Engineers at Cardiff, is reproduced elsewhere in this issue, was appointed borough engineer and surveyor of Neath in 1886, and subsequently water engineer and engineer to the corporation electrical undertaking. He has carried out many important works in the borough which he serves. He has acted as arbitrator in sewerage compensation cases and in boundary and other disputes, and has had considerable Parliamentary experience in connection with schemes promoted by his own and other authorities.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

EAST MIDLAND DISTRICT.

An East Midland District meeting is to be held at the Town Hall, Loughborough, on Saturday, April 10th.

PROGRAMME.

2.15 p.m.—The members and visitors will be received in the Council Chamber by the Mayor of Loughborough (Mr. W. W. Coltman, J.P.).

2.30 p.m.—To receive minutes of last meeting.
To elect district committee.
To discuss election of district representative, district chairman, and district secretary.
To consider any other general district business.

3 p.m.—Proceed in conveyances (at a charge of 1s. per person) to inspect the swimming baths, where members will be given the opportunity of inspecting an apparatus for teaching swimming, erected by Messrs. Herbert Morris, Limited, of Loughborough.
Proceed to sewage farm to inspect refuse destructor and other works.

5 p.m.—Arrive at town hall, where tea will be provided by the borough surveyor, Mr. A. H. Walker, Assoc.M.Inst.C.E.

E. H. Crump, Assoc.M.Inst.C.E.,
Hon. District Secretary

Hinckley.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. W. H. Matthews Jones, City Engineer and Surveyor, Chester.

NORTH-EASTERN AND EASTERN DISTRICTS.

A meeting of the North-Eastern and Eastern Districts of the institution will be held at Newark-on-Trent on Saturday, April 24th.

1.45 p.m.—Meet at the Saracen's Head Hotel, and proceed to the inspection of old castle ruins.

En route Ossington Coffee Palace, Trent Bridge and free library will be pointed out.

Parish church (exterior and interior). A short organ recital will be given by Mr. W. F. Wright, A.R.C.O., organist.

Old Magnus Buildings, with Tudor Hall, recently restored at a cost of £2,000 by Mr. H. W. Lockton, M.S.A. (member).

Various old buildings in Market-place.

Beaumond Cross.

New Magnus Grammar School (by the kindness of the Rev. H. Gorse, M.A., head master), designed by Mr. Lockton, and carried out at a cost of over £10,000.

5 p.m.—High tea at the Saracen's Head Hotel, at a cost of 2s. 6d. per head.

Short descriptive notes of the visits will be given by Mr. Lockton, and by Mr. P. A. Watford (member), surveyor, Claypole Rural District Council.

Members of the Yorkshire and other districts are invited to attend.

G. Bellson Cheeves,
Hon. District Secretary.

Oundle, Northants.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Tuesday, April 13th, at the Institution of Electrical Engineers, Victoria Embankment, W.C., a paper, entitled "Main Roads, Past and Present, and Modern Methods of Construction and Maintenance," will be read by Mr. Frank Grove, M.I.M. and Co.E., assistant county surveyor of Surrey, the following being a synopsis:—

Brief history of roads from the time of the Romans to the present day—Traffic requirements immediately prior to the introduction of self-propelled vehicles—Details of road construction at that time—Effects of motor traffic on the old type of roads, and some methods employed to cope therewith—Description of a few of the modern methods of road construction and maintenance employed during recent years in the county of Surrey.

The chair will be taken at 7.30 p.m.

A. S. E. Ackermann,
Secretary.

17 Victoria-street, S.W.

Town Planning Institute.—We have received a copy of the first issue of the "Proceedings" of this institute. It relates to the first of three meetings held to discuss the Ruislip-Northwood town planning scheme. The reports of all meetings can be obtained from the secretary, Mr. A. R. Potter, 4 Arundel-street, W.C., price 1s. per copy.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

INSPECTOR OF NUISANCES.—April 3rd.—Twickenham Urban District Council. £140—£170 per annum.—Mr. H. J. Saunders, clerk.

ASSISTANT SURVEYOR AND INSPECTOR.—April 6th.—Kingswood Urban District Council. 25s. per week.—The Clerk, Council Offices, Kingswood, Bristol.

TEMPORARY ENGINEERING ASSISTANT.—April 6th.—Wantage Rural District Council. £2 12s. 6d. per week.—Mr. John W. Harris, engineer and surveyor, East Challow, Wantage, Berks.

SUPERINTENDENT OF HIGHWAYS.—April 8th.—Corporation of Huddersfield. £130 per annum.—Mr. K. F. Campbell, borough engineer and surveyor, 1 Peel-street, Huddersfield.

DRAUGHTSMAN.—For the Nigerian Government Railway. £300—£350 per annum.—Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W.

COST CLERK.—Sheffield Corporation.—General Manager, Water Department, Town Hall.

CLERK OF WORKS.—Ivybridge Urban District Council. £3 3s. per week.—Mr. Harry Francis, engineer, 12 Lockyer-street, Plymouth.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

WHITEHAVEN.—April 21st.—Competitive designs for laying out the couch road site (6 acres 1 rood 25 poles) and the erection of houses, for the town council. Premiums, 30, 20 and 10 guineas.—Mr. T. Brown, town clerk.

GALEMIRE.—Designs for a small hospital, for the Galemire (Whitehaven) Joint Hospital Committee.—Mr. E. B. Croasdell, clerk, Union Hall, Whitehaven.

STEPNEY.—Designs for municipal buildings, for the borough council. Mr. H. T. Hare, F.R.I.B.A., has been appointed assessor.—Mr. G. W. Clarke, town clerk, 15 Great Alie-street, Whitechapel.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

ANGLESEY.—April 7th.—For the erection of new schools, for the Education Committee.—Mr. J. Owen, county architect, Menai Bridge.

TRURO.—April 8th.—For the erection of a clock turret in steel and concrete and other works, for the corporation.—Mr. F. A. Barnes, city engineer and surveyor.

WINDSOR.—April 8th.—For the erection of bathing boxes, for the corporation.—Borough Surveyor, Alma-road, Windsor.

TRURO.—April 8th.—For the erection of a clock turret in steel and concrete, and alterations to the council chamber, for the corporation.—Mr. F. A. Barnes, city engineer.

HYTHE.—April 9th.—For building a timber-framed and corrugated-iron isolation hospital for eight beds, for the corporation.—Mr. Chris. Jones, borough surveyor, Hythe, Kent.

CORNWALL.—April 10th.—For the erection of a school, for the Education Committee.—Mr. B. C. Andrew, architect, Biddicks-court, St. Austell.

TYRONE.—April 12th.—For additions to Dungannon House, and the erection of a pavilion and medical officer's residence, for the county council.—Mr. J. A. Hunter, Lisburn.

EASINGTON.—April 13th.—For the erection of fifty houses, and the construction of streets, for the rural district council.—Mr. G. Waterhouse, architect, Council Offices.

ASHINGTON.—April 17th.—For the erection of gasworks, for the urban district council.—Messrs. W. A. Valon & Son, Caxton House, Westminster, S.W.

CHERTSEY.—April 22nd.—For the erection of an additional engine-house, gas generating house, new workshop and coal store adjoining the present pumping station, Byfleet Village, together with engine-sheds and other buildings, for the rural district council.—Mr. Charles Muggleton, Byfleet-corner, West Byfleet.

TETBURY.—April 23rd.—For sinking a borehole, for the urban district council.—Mr. H. J. Weaver, consulting engineer, Northgate Mansions, Gloucester.

sec. 98 of the Thames Conservancy Act, 1899, and sec. 7 of the Middlesex County Council Act, 1906. In the Mersey and Irwell Joint Committee Act, 1892 (sec. 10), and the West Riding of Yorkshire Rivers Act, 1894, the power to take samples is limited to the point at which the effluent enters the stream. We think this limitation is undesirable.

STORM-WATER SEWAGE.

"We consider that the standards should not apply to storm-water sewage. In regard to this matter we refer to para. 292 to 295 of our Fifth Report," and we repeat our recommendations with regard to storm overflows and the treatment of storm sewage, the adoption of which would, in our opinion, prevent the occurrence of nuisance.

TIDAL WATERS.

"In Part VII. of our Fifth Report we summarised the position in regard to the pollution of estuaries and tidal waters (which we dealt with at length in our Fourth Report), and stated that we did not think it practicable to lay down fixed rules as regards a standard of effluent for tidal waters.

"We do not now suggest that the general standard should apply automatically to tidal waters as in the case of non-tidal waters, but we think that the principle which we have recommended in regard to special standards for streams might usefully be applied to tidal waters where a standard is considered necessary."

NINTH REPORT

Our Ninth Report dealt (i.) with the discharge of manufacturing wastes which for any reason could not be taken into sewers, and (ii.) with the disposal of domestic refuse in rural areas. In the first part we gave a detailed account of most of the chief trade processes by which waste liquids were produced, of the character of those liquids, and of the means which had been or could be adopted for purifying them. This account embodied the result of our own observations at a number of works which were selected on the advice of rivers and county authorities as being fairly representative of the various trade processes and as including the best examples of purification plant; it also contained the results of experiments which we had instituted in regard to certain trade liquids, the purification of which was especially difficult. We also utilised information placed at our disposal both by manufacturers and by officials of the West Riding of Yorkshire Rivers Board and the Mersey and Irwell, and Ribble Joint Committees.

We found that efficient means of purification were available in the case of some, but not all trade liquids. Many wastes, the impurities of which were mainly in solution, could be considerably improved by clarification, but could not, in the present state of knowledge, be thoroughly purified.

Hence the requirement of the existing law that trade wastes should (subject to certain exceptions) be rendered "harmless" was in many cases impracticable, and the authorities charged with the duty of administering the law had to exercise their own discretion in regard to the degree of purification to be demanded of manufacturers. We considered therefore that, as in the case of sewage effluents, there should be prescribed for trade effluents a standard of purity which should at once be a guide to the administrative authorities and a security to the manufacturers in regard to the extent of their obligations.

We found further that, owing to the wide differences in the character of the various trade wastes, both as regards their effect upon streams and as regards the difficulty and expense of treating them, it would be necessary to consider each kind of trade waste separately, with a view to suggesting an appropriate standard. We gave reasons for thinking that it was not desirable or necessary to prescribe a graduated system of standards (as we proposed in the case of sewage effluents), but that a single standard for each trade would suffice, provision being made for raising or lowering the standard where shown to be necessary in exceptional cases.

For the purpose of suggesting standards for the different trade wastes, we found it convenient to classify the wastes as follows:

"(A) Those for which efficient purification is practicable.

"(B) Those for which efficient purification is not in the present state of knowledge practicable.

"In Class A we include waste liquors resulting from:—

(i.) Coal washing.
Tin mining.
Lead and zinc mining.
China-clay works.
Stone quarrying.
Stone polishing.
Wood pulp paper works.
} In all these cases adequate reduction of solids in suspension may be regarded as efficient purification.

(ii.) Brewing.
Malting.
Distilling.
Tin plating.
Galvanising.
Wire drawing.
Shale oil distillation.
Woolscouring.
Tanning.
Leather dressing.
Fellmongering.
Dairying.
} In these cases dissolved impurities should also be removed.

"In Class B we include waste liquors resulting from:—

(i.) Bleaching.
Waste bleaching.
Paper work (except where paper is made from wood pulp only).
Cotton dyeing.
Cotton printing.
Woollen dyeing.
Woollen piece and yarn scouring with dye liquor.

(ii.) Sulphite cellulose manufacture.
Gas and coke production.

Although no practicable means are known for rendering completely harmless the liquids included in this class, nearly all of them can be and are considerably improved by clarification.

"We have placed sulphite cellulose paper and gas liquor in a separate subdivision because we are not aware of any method of so treating them that the effluents could properly be discharged direct into streams."

As regards the standard to be prescribed, we stated as follows:

"We think it impossible to lay down, as regard each trade, such a standard as would ensure the complete purification of rivers, since, in the present state of knowledge, the attainment of such a standard would in many cases be financially impracticable, and therefore useless. We have thought it useful, however, to suggest limits of impurity which we believe to be now practicable, and which are based upon careful consideration of the data given in the detailed sections.

"These figures will afford guidance to the central authority when established, and, although provisional and based upon the present condition of knowledge, they should, in our opinion, if prescribed, remain in force for a definite period. At the end of this period they would be subject to revision, since admittedly they are inadequate to prevent pollution of streams, and improved methods of treatment may meanwhile have been discovered.

"In regard to the period for which standards for sewage effluents should remain in force we made the following suggestion in our Eighth Report:

> "52. We think it of importance that a standard once imposed upon a local authority should not be altered until the expiration of a definite period in order that they may have some security as to the extent of their liability.
>
> We suggest that these periods should be prescribed by order of the central authority, and should in the case of the general or any specially stringent standard be not less than ten years from the date when the standards came into

[*] Summarised under heading of Fifth Report.—Ed. THE SURVEYOR.

operation. In the case of [illegible] standard the period should be [illegible]. The [illegible] the latter requires [illegible] a standard the [illegible] there may be difficulty in reducing the period during which the standard should be in force, and, on the other hand, it is [illegible] other [illegible] to the Board of Trade periodically [illegible] to the Board's consent to any particular [illegible] and the [illegible] of those periods. [illegible] experience to be gained [illegible] general standard required any modification (which we suggest [illegible] by the issue of an order), and also to revise, where necessary, the special standards in particular cases.

"We think the [illegible] applied to standards for trade effluents—viz., that in the case of those [illegible] expensive plant is prescribed the period might be longer than in those where only partial means of purification are as yet known. In the latter case the period could, of course, be extended if in the meantime no improved [illegible] discovered.

CLASS A.

"[illegible] we have pointed out above, notwithstanding the [illegible] in suspension may be regarded as [illegible] and the [illegible]

COAL WASHING.

"We think that the effluent should not contain more than 4 parts of suspended solids per 100,000. In a number of cases this standard might have to be relaxed.

TIN, LEAD AND TIN SLAG, CHINA CLAY WORK, STONE QUARRIES, AND STONE POLISHING WORKS.

"Here we assume practically a standard of 6 parts suspended solids per 100,000. In general evidence shows, reduction of suspended solids to this [illegible] by lead, tin, antimony, or arsenic.

"There are, however, cases in which [illegible] other than those of the particular industry are affected by the discharge of the waste waters. If it can be shown, as in the case of [illegible] to the sea which are not used for fishing, for navigation [illegible] or manufacturing purposes [illegible] waste waters without treatment, we think that the standard might be relaxed or wholly dispensed with.

PAPER MILL WHERE WOOD PULP ALONE IS USED.

"In this case the effluent should not contain more than 4 parts of suspended solids per 100,000.

CLASS A (a).

"In these cases such reduction of [illegible] as well as suspended impurities is necessary.

BREWERIES AND MALTINGS.

"We suggest that the effluents should contain not more than 4 parts per 100,000 suspended solids, and should take up not more than 4 parts per 100,000 dissolved oxygen in five days.

DISTILLERIES.

"For the various methods of treating this waste we refer to our Sixth Report. Since the issue of that report we have kept under observation plants which were erected on the lines which we recommended, and have found them both efficient and economically practicable. We recommend a standard of 3 parts suspended solids and 2 parts dissolved oxygen absorption in five days. (This corresponds with the general standard which we have suggested for sewage effluents.)

TIN PLATING, GALVANISING AND WIRE DRAWING.

"These wastes are strongly acid from mineral acid, and contain much iron in solution. The stronger liquids should not in any circumstances be allowed to discharge into streams. The wash waters should be neutralised and settled.

"We suggest that the standard for these wash waters should be 6 parts per 100,000 suspended solids.

"Even after compliance with this standard, a somewhat yellow and colloidal liquid might result. It might possibly have to be softened before discharge, but we do not think it necessary at present to suggest any standard of hardness.

WOOL DISTILLATION.

"[illegible] such we suggest the 4 parts per 100,000 suspended solids, and 4 parts per 100,000 dissolved oxygen [illegible]

WOOL-SCOURING LIQUOR.

"The [illegible] precipitation liquor, obtained by subjecting wool-scouring liquor to direct precipitation, is practically free from fat, it remains very strongly organic, and may be regarded as similar to a highly concentrated sewage liquor; and the same may be said of the septic tank liquor from wool suds, which also contains much sulphuretted hydrogen.

"For this reason we consider that the liquor should be looked upon as a sewage and purified biologically. This treatment has so far only been carried out in the laboratory, but we are of opinion that it is practicable at a reasonable cost, and, subject to our conclusion being verified by experiments on a large [illegible] a standard of 4 parts suspended solids and 4 parts dissolved oxygen absorption in five days.

"Pending such experiments we would suggest for this type of precipitation liquor clarification down to 6 parts of suspended solids per 100,000.

CURRIED CATTLE LEATHER DRESSERS' WASTE AND [illegible] WASTE.

"These wastes are also highly polluting, and contain much organic matter of animal origin in solution. Our observations in regard to the treatment of wool suds are equally applicable to these wastes, and we make a similar suggestion in regard to a standard—viz., 4 parts suspended solids and 4 parts dissolved [illegible] five days.

BARLEY WASTE.

Here [illegible] are applicable. We suggest as a standard 4 parts suspended solids and 4 parts dissolved oxygen absorption in five days.

CLASS B.

"We [illegible] that [illegible] trade waste in regard to which we are not in a position to say that efficient means of purification (such as would render them 'harmless') are reasonably practicable and available. As we have said, however, some of them [illegible] are necessary to present knowledge, capable of being considerably improved, and it will be useful to indicate to what extent improvement has been found to be practicable.

CLASS B (a).

BLEACHING.

"In this case the polluting matter is mainly in solution, but some improvement would be effected by reduction of suspended solids. We suggest that it should not show more than 6 parts suspended solids.

"Systematic experiments on a large scale would be necessary before suggesting any standard based on the absorption of oxygen.

WASTE BLEACHING.

"The waste liquor from this trade is of the same nature as that from bleaching, but it may contain a good deal of soap in addition. We suggest a standard of 6 parts suspended solids per 100,000. Systematic experiments on a large scale are also required here.

PAPER WORK (STRAW) AND RAG PAPER (RAG AND WOOD PULP PAPER).

"The liquid portion of most of these wastes is, as a rule, considerably weaker than that of bleach wastes, but we have found one instance where it was equally strong (owing, probably, to a less abundant water supply).

"Here, too, systematic experiments on a large scale are necessary. In the meantime we can only suggest a standard similar to that proposed for bleach wastes—viz., 6 parts suspended solids.

PAPER WORKS (BROWN PAPER AND WALL PAPER).

"For the waste liquors from these works we think that a standard of 6 parts of suspended matter would suffice at the present time.

COTTON DYEING AND COTTON PRINTING.

"Compared with many other wastes these are not very polluting, but their volume is large. Although most of their oxygen-absorbing power is due to dis-

solved impurities, considerable improvement is effected by clarification.

"We suggest as standards 4 parts suspended solids for cotton-dye liquor, and 6 parts for the liquor from print works.

WOOLLEN DYEING, FELT AND YARN SCOURING AND FLANNEL-SCOURING LIQUORS OCCURRING EITHER SEPARATELY OR IN ANY COMBINATION.

"Though these wastes are not usually concentrated, their liquid portions are, as a rule, of an oxygen-absorbing and putrescent nature. Clarification produces considerable improvement. As a standard we suggest 4 parts suspended solids per 100,000.

WOOL SCOURING, WITH FELT AND YARN SCOURING AND DYE LIQUORS.

"Wool-scouring liquor or wool suds, when unmixed with other wastes, forms the subject of a later paragraph. It is an exceedingly polluting liquid, and when it is combined with those discussed in the preceding paragraph it adds considerably to their strength.

"If, however, all four liquors, as produced together at the works, are carefully mixed, it is possible to obtain, with the aid of good precipitation, a non-putrescible effluent which does not take up oxygen at an excessive rate.

"The standard which we suggest is 4 parts suspended solids.

Class B (ii.).

MANUFACTURE OF SULPHITE CELLULOSE.

"So far as we are aware, there are only two works in this country from which either the waste liquid produced by this process or the more dilute washings are discharged into a stream. We are unable to suggest a standard appropriate to the waste liquid, but we think that neither the liquor itself nor the first washings should be discharged into a stream.

GAS LIQUOR.

"Here, too, we are unable to suggest a limit of purification. In no circumstances should the liquor be discharged untreated into a stream. In some cases purification by percolation through 'bings' may be sufficient to permit the discharge of an effluent, but we can make no general pronouncement on the point. Where no bings exist biological treatment on the lines suggested by Dr. Fowler will lessen very materially the polluting power of the liquor. Evaporation appears to be the only other practicable alternative at the present time."

"The information which we have set out above is obviously incomplete. It does not extend even to all existing trade processes whereby polluting liquids are produced, though it includes the most important, and it is to be anticipated that new processes will continually be coming into operation and creating a demand for new means of purification—a demand which could not be efficiently forestalled by any system of standards which we could suggest.

"We do not, therefore, recommend that the central authority should forthwith proceed to prescribe a complete set of standards for all known kinds of trade waste, but we think it eminently desirable that a general standard should be prescribed in all cases where its efficacy and practicability have been in some measure tested by experience. We are confirmed in our view inasmuch as the West Riding of Yorkshire Rivers Board, the Mersey and Irwell and the Ribble Joint Committees, and the Thames Conservancy Board have progressively employed for their own guidance working rules which are in the nature of standards. It will, however, be necessary to consider the prevention of pollution both by existing and by new processes for which no standard can as yet be fixed.

"In the case of some trade wastes additional standards may have to be imposed—*e.g.*, standards of hardness and of 'caustic' alkalinity or acidity, or a requirement of neutrality, for the effluents from various branches of the cotton, woollen and paper trades and from metal works; a standard for arsenic or other poisonous metal for trade effluents from substances are used or mined; an oil-film standard for the wastes from oil, gas, grease or soap works, &c. Some further investigation may be required before such standards—or some of them—can properly be laid down.

"These standards should, in our opinion, be looked upon for the most part as *general* standards, applicable only to certain rivers or reaches of rivers where local circumstances call for them. It is important, however, that the necessity for imposing them in special cases should be borne in mind when the *general* standard is being considered, for in some cases the special standard may be required more urgently than the general standard. Several manufacturers have, for instance, urged that the 'softness' of a river water is of greater moment to them than its organic purity. It will be necessary also to have special regard to the protection of drinking waters against mineral poisons."

In regard to the alterations of the law which would be necessary to give effect to our proposals, we made the following recommendations:

ALTERATION OF EXISTING LAW.

"We may now set out in greater detail the proposed amendments of the existing law which have been foreshadowed in the earlier sections of this report. We recommend that the law should be altered so as to provide as follows:—

"(1) The central authority may by order prescribe a general standard for effluents produced by any trade process therein defined, the standard to remain in force for a period to be specified in the order. The order shall be published in the *London Gazette*, and a copy of it shall be sent to every rivers board, county council and sanitary authority.*

"(2) Where a general standard has been thus prescribed, the authority, before taking proceedings, shall serve a notice on the manufacturer specifying the requirements of the general standard and the period within which the requirements are to be complied with. After the expiration of that period, proceedings may be taken against him for non-compliance with the notice (but on no other ground†), and the consent of the central authority shall not be required to such proceedings. The proceedings should not be taken in a county court for an order, but in a court of summary jurisdiction for a penalty. The court may extend the period in which the requirements are to be complied with, and if they consider that it is doubtful whether the notice can reasonably be complied with, they shall remit the question to the central authority, who shall confirm or modify or cancel the requirements, and who may fix a period during which the requirements as confirmed or modified shall be in force or shall be cancelled, as the case may be. The central authority may from time to time extend such period, but on the expiration of the period the requirements of the general standard shall be deemed to be again in force in regard to the works in question.

"(3) Where no general standard has been prescribed the authority, before taking proceedings, shall serve a notice on the manufacturer specifying the degree of purification which they propose to require, certifying that means are available for meeting their requirements, and prescribing the period within which their requirements are to be met. Within one month of the service of the notice the manufacturer may appeal to the central authority against the notice. If he does not appeal, proceedings may be taken against him after the expiration of the prescribed period as if the requirements of the notice were a general standard in force in regard to his works.

"If he appeals, the central authority shall confirm or modify or cancel the requirements of the sanitary authority. If the central authority confirm or modify the requirements, such requirements as confirmed or modified shall be deemed to be the standard in force in regard to the works of that manufacturer for such period as the central authority shall specify. The central authority may also extend the period within which the requirements must be complied with, and on the expiration of such period as prescribed or extended proceedings may be taken without the consent of the central authority for the recovery of a penalty for non-compliance with the standard in force. If the central authority cancel the requirements of a notice, no proceedings shall be taken within that period.

"(4) Where a general standard has been prescribed, but for any reason the authority propose to require of any manufacturer a higher degree of purification than is required by the standard, the authority shall also set out in the notice the requirements of the general standard and the reasons for requiring the higher degree of purification. In all other respects

---

*This expression includes Rivers Boards, county councils, and joint committees of county councils.

†*I.e.*, not on the ground that he is discharging a "poisonous, noxious, or polluting liquid," but only on the ground that his effluent infringes the particular standard.

the procedure shall be as if no general standard were in force.

"(5) The authority shall be required to prepare an annual report on the administration of the Rivers Pollution Prevention Acts within their area, including particulars of all requirements made by them under the Act, whether appealed against or not, and to submit a copy thereof to the central authority.

"(6) Where a Rivers Board is constituted for any area, the authority for the purpose of enforcing the Rivers Pollution Prevention Acts in that area shall be the Rivers Board. The order constituting the Rivers Board shall provide for the adequate representation on the Rivers Board of any fishing interests concerned.

"(7) Where no Rivers Board has been constituted for the purpose of enforcing the Rivers Pollution Prevention Acts, the county council, the council of a county Borough, or the central authority may, by Provisional Order, confer on or impose upon the Rivers Committee any powers or duties of a Rivers Board, including the co-optation of representatives of any fishing interests for the said purposes.

NEW SOURCES OF POLLUTION.

Representations have been made to us that the law should be altered with a view to the prevention or regulation of the establishment of new sources of pollution. It has been suggested that every person who proposes to set up works whereby liquid refuse might be discharged into a stream should be required to give notice of his intention to the sanitary authority or Rivers Board specifying what steps he proposes to take to prevent such liquid refuse from polluting the stream; that the sanitary authority or Rivers Board should have power to report to the central authority to disapprove the proposals; and that any person failing to give notice or commencing to discharge liquid refuse after his proposals have been disapproved should incur a penalty.

"We are fully in sympathy with the object of taking measures to prevent the pollution, but we think that the suggested procedure might involve needless interference with manufacturers. We do not, therefore, recommend that the law should be altered except to this extent—that the manufacturer proposing to establish new works from which liquid refuse would be discharged into a stream should be required under penalty to give to the Rivers Board as long notice as possible, and at least a month's notice, before commencing to discharge. The Rivers Board would then indicate to him the degree of purification which would probably be required of him.

"We do not think that a penalty other than for failure to give notice or to obtain approval of a proposal should be imposed.

POWER OF ENTRY.

"We regard the present [illegible] as a great improvement on the English Rivers Act, which we think should extend to entry on the purification works of manufacturers.

(59) We think that the officers of the central authority and of the Rivers Boards should have statutory authority to enter upon lands at any time without notice for the purpose of inspecting works and taking samples of the liquor or effluent and river water wherever they can be obtained. The Rivers Pollution Prevention Act, 1876, contains no provision on this subject, but reference may be made to secs. 16 and 17 of the Alkali Works Regulation Act 1881, sec. 98 of the Thames Conservancy Act 1894, and sec. 7 of the Middlesex County Council Act, 1906. In the Mersey and Irwell Joint Committee Act 1892 (sec. 10) and the West Riding of Yorkshire Rivers Act, 1894, the power to take samples is limited to the point at which the effluent enters the stream. We think this limitation is undesirable.

"We recommend further that manufacturers should be required under penalty to provide facilities for taking samples of effluent at the point or points where it leaves their premises.

MINE WATER.

"We have already referred to the exemption which is conferred by the Rivers Pollution Prevention Act, 1876, in regard to waters proceeding from any mine 'in the same condition as that in which it has been drained or raised from such mine.' We are not aware of the circumstances in which this exemption was [illegible] We have received some evidence of the pollution caused by some mine waters of this character, which in many cases continues after the mine has ceased to be worked. But our evidence is not sufficient to enable us to make any general recommendation in regard to preventing this form of pollution. Under the system which we have suggested it would be open to a sanitary authority to demand purification of such waters subject to appeal to the central authority, who would be able to consider each case on its merits."

In the second part we [illegible] on the disposal of solid and liquid [illegible] in rural areas.

[illegible] and describe [illegible] adopted in sparsely populated districts where, owing to distance, a public water supply and sewerage system is impracticable. We pointed out the risks of pollution and infection attendant on these methods, and indicated the means by which in our opinion these risks could be reduced to a minimum. The most important [illegible] these systems is to ensure the frequent and [illegible] removal of excreta from dwellings. The cesspools ought to be small and [illegible] We [illegible] that should be made to obtain the consent of the sanitary authority [illegible] Dr. Pearse strongly recommended the use of pails and the regular disposal of their contents in [illegible] existing in garden ground [illegible] being also disposed of on the land, the steaming being a simple method. This system, which he had instituted on his own property, he found both hygienic and profitable. We could not, however, follow him in recommending it [illegible] available.

We pointed out that there must always be a certain [illegible] which could not be dealt with by a dry-earth closet, but this [illegible] small no difficulty need arise, but where an ample water supply is available the volume [illegible] largely increased and a water-carriage system becomes inevitable. Cesspools might be utilised, but if they are [illegible] it would probably be [illegible] and [illegible] more than [illegible] they might endanger water supplies. A system of sewerage and sewage disposal should, in our [illegible] be [illegible] an abundant water supply.

We [illegible]

"In rural areas the main fact governing the question of the disposal of excremental matter and domestic waste waters is the abundance or the scarcity of the water supply.

"(1) With an abundant water supply, piped to the houses, water carriage is, in our opinion, the most satisfactory system. In most cases abundant water supply will involve a system of sewerage. Where there are isolated dwellings which it would be very costly to connect with the drainage system of the district the cesspool is a possible alternative where there is no danger of polluting water supplies.

"Under the Public Health Act local authorities have a discretion in regard to compelling connection with their sewers. We think it right that with their local knowledge they should have this discretion. The storage and disposal of excreta is a matter concerning a man's neighbour as well as himself.

"(2) Where a water carriage system is impossible because of the inadequate water supply we believe that under proper supervision a system of dry closets may be open to little objection on sanitary grounds provided the closet is so constructed that its contents can be conveniently and frequently removed, as by the use of pails.

"In small communities the removal may generally be left to the householder. In larger villages it may with advantage be undertaken by the local authority.

"The domestic waste water is best distributed over the gardens, or it may be conveyed to a cesspool as far as possible from the dwellings [illegible]

water supplies are prejudiced by the leakage from them.

"In villages where no sewers are available it is desirable that cottages should be provided with ample garden space for the disposal of domestic refuse.

"The use of dry earth in dry closets is of great importance, and local authorities should be given full power to secure its use.

"Local authorities should also circulate to householders elementary information as to the best method of dealing with refuse over their gardens."

BORROWING BY LOCAL AUTHORITIES.

ANOTHER LOCAL GOVERNMENT BOARD CIRCULAR.

The following circular, dated March 25th, has been addressed by the Local Government Board to local authorities in England and Wales:

In their circular letter of the 11th instant the Local Government Board referred to the decision of the Lords Commissioners of His Majesty's Treasury to restrict capital issues by local authorities within the narrowest limits. It was pointed out in the same circular letter that labour should be economised by local authorities as far as possible, and that the inception of new works, except such as are of pressing necessity, either for reasons of public health or on account of war requirements, should be avoided.

The board have been in communication with their lordships in regard to this matter, and it has now been arranged, in order to meet the convenience of local authorities and to avoid duplication of labour, that the sanction, approval or consent of the Local Government Board to any borrowing under powers conferred by public general Acts or by local Acts or Provisional Orders, under which such sanction, approval or consent is required, shall suffice, without any further approval by the Treasury, where

(a) the sanction, approval or consent has been given on a date subsequent to the 12th instant, and

(b) the money proposed to be raised is to be raised otherwise than by the issue of stock, bonds or bills.

Where a local authority hold a sanction, approval or consent of the board of an earlier date than the 12th instant which has not yet been acted upon, whether wholly or in part, no further action must be taken upon it without a further sanction from the board authorising the action, unless the money is to be raised by the issue of stock, bonds or bills, when the consent of the Treasury must be obtained instead of the further sanction of the board.

The Treasury have further decided that their approval will not henceforth be required for the renewal or replacement by local authorities of maturing mortgages.

With respect to the statement in the board's circular letter to which reference is made in the first paragraph above, that it has become necessary to avoid the inception of all new works except such as are of pressing necessity, either for reasons of public health or on account of war requirements, it must be understood that these terms will be construed in their strict sense.

Consequently, before any application is made to the board with a view to the immediate execution of works, local authorities should fully satisfy themselves that they can show that the expenditure cannot be avoided, postponed or reduced. Any application should be accompanied by a statement of the facts upon which the local authority rely in these respects.

The Treasury are anxious that the attention of local authorities should be particularly drawn to the fact that economies and restrictions on borrowing are possible not only as regards new works, but also as regards works in progress. As regards these latter, it will frequently be found possible by arrangement with contractors or otherwise to postpone works or parts of them, or to enlarge the period allowed under contract for their completion. In any case in which an application for sanction to this board or to the Treasury is necessary, where works are in progress or are the subject of a contract, it will be necessary to demonstrate that every possible effort has been made in this direction before the extent of the application has been finally determined upon.

TREASURY AND LONDON COUNTY COUNCIL.

In a letter to the London County Council, dated March 8th, the Treasury intimate that they are unable to approve of Clause 25 of the London County Council (Tramways and Improvements) Bill, which authorises the council to expend on capital account a sum not exceeding £271,900 for tramway purposes. The Treasury refer to their previous communication on the subject of certain applications for their approval of loans by the council to borough councils for the purpose of new capital expenditure, and observe that considerations similar to these apply to capital expenditure by the council itself. They trust that the council will agree with them that, as far as possible, all new capital expenditure should be postponed, and that unless special circumstances exist works in progress should be slowed down. In the event of the council preferring to proceed with the Bill, the Treasury ask that an undertaking should be given that none of the schemes will be commenced or any expenditure incurred in connection with them without the previous sanction of the board.

Another letter [illegible] that the Treasury [illegible] no further objection to the granting of the following loans by the county council:

Battersea Metropolitan Borough Council, £3,000 for electricity mains.

Hammersmith Metropolitan Borough Council, £10,000 for electricity undertaking.

Lambeth Metropolitan Borough Council, £[illegible] for paving work.

North Surrey District School Managers, £1,124 for Anerley school.

Lambeth Metropolitan Borough Council, £1,013 for paving works.

Lambeth Guardians, £[illegible] for work at Brooke-road infirmary.

In sanctioning the above loans the Treasury have been mainly influenced by the consideration that the expenditure has already been incurred practically as a whole, while in the case of Battersea the expenditure is justified as being for the furtherance of the war. "But," it is added, "it should be intimated to the borough councils that the Treasury will not be able to approve any loans by the London County Council for new expenditure which is not necessary for the furtherance of the war, whether or not all the sanctions, departmental or Parliamentary, normally required have already been obtained, and that approval will not be given for the borrowing of sums already spent unless the council are able to satisfy this department that every effort is being made to restrict expenditure upon works already in progress as well as upon new works."

Dealing with the action of the Hackney Borough Council in obtaining from their bankers the sum of £10,000, which the department had declined to allow them to borrow from the London County Council, the Treasury say that, while they are not prepared to require that their approval should be obtained in all circumstances before sums are borrowed by borough councils from their bankers, they desire it to be understood that, if a council insists upon incurring capital expenditure against the wishes of the department—which, they point out, is acting with a view to the general interests of the nation in existing circumstances—sanction will not be given by the Treasury or the Local Government Board in the case of any further application for approval to borrowing for any purpose whatever.

Regard being had to the fact that the borough council of Stoke Newington have already spent the sum of £4,000 in connection with their electricity undertaking which they now desire to borrow from the London County Council, Treasury approval would not be withheld from the proposed loan provided that the borough council will undertake not to incur further capital expenditure of any kind in existing circumstances which is not really necessary in the national interest.

Recruits Wanted for London Sanitary Company.—The 1st London (City of London) Sanitary Company, R.A.M.C. (T.), are asking for more recruits for Imperial Service. Men of nineteen to thirty-five who are sanitary (or assistant) inspectors, or who possess a good knowledge of sanitation, men in public health departments of borough, urban or rural authorities, surveyors, engineers, carpenters and plumbers are specially required. There is a very good prospect of going abroad [illegible] being continually sent overseas. Applications for enlistment should be addressed to O.C. 1st London Sanitary Company, Duke of York's Headquarters, Room B. 6, Chelsea, S.W.

[illegible] would prove a great [illegible] under the [illegible] ation.

The speed of rotation is generally to the engineer's hand of 500 revolutions per minute, although this can be increased to suit the conditions under which the pump has to work.

Careful attention has been shown in the design to make a pump having long life. For instance, the bearings of the larger sizes are all white metal lined and of ample area. The load per square inch of bearing area in no case exceeds 80 lb. per square inch. Another important item of design is positive speed for with pumps dealing with thick substances this has to be kept low. The pump at the Stanford Road sewage pump is below 100 ft. per minute.

The lubrication of the internal wearing parts is effected by the liquid the pump is handling with the addition of grease which is supplied to the bearings

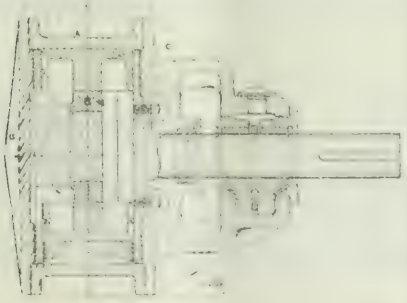

FIG. 2.

by Stauffer grease cups. The cutting up action previously referred to is effected by the cylinders passing the lower shoe, and effectively shearing any obstruction which may protrude such as rags, paper or sticks.

The whole pump can be very easily examined at any time by the removal of one end cover, and without disturbing any pipe joints. The rotor can be withdrawn from the pump without any unbolting of the pump from its bed, or without touching the motor which drives it. On a long suction lift the pump answers admirably on account of its high vacuum-forming propensities. On a closed suction a vacuum of within ·25 of the barometer can easily be maintained.

The Rotoplunge pump can be used to handle air entirely as a vacuum pump or as a compressor. For the drainage of cesspools and other work it is admirably adapted.

The introduction of this pump will undoubtedly solve a great many of the troubles of sewage work, and we refer anyone interested to the makers, The New Rotoplunge Pump Company, Limited, 24 Broadway, Westminster, S.W.

The War and Salaries. The Establishment Committee of the London County Council have, in view of the exceptional circumstances obtaining owing to the war, decided not to submit any recommendations to the council with regard to the annual revision of salaries, and have been informed that the staff generally agree to this course. Other committees have taken similar action as regards certain of the staff for which they are responsible. "We think," observe the General Purposes Committee in a report submitted last Tuesday, "that the council will learn with satisfaction of the spirit in which the staff as a whole have concurred in the course taken and have performed the additional duties occasioned by the absence on war service of many of their colleagues without expectation of additional remuneration."

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, assoc.m.inst.c.e.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for March is divided between

Mr. B. Knight,
Town Hall,
Newport, Mon.,

and

Mr. M. T. Roberts,
Cartref,
Grange-road,
Rhyl,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

463. Bomb-proof Dug-out.—Give sketches of a bomb-proof dug-out to hold five people. (Tico.)

466. Road Making.—Describe a few simple tests that will enable an engineer to ascertain the quality of the bitumen and filler to be used in a bituminous macadam road. (Eneer.)

469. Sewage Sprinklers.—Give a good practical method of marking off the holes in the distributing arms of revolving sprinklers. The diameter of holes to be constant. (C. A. B., *Catford.*)

470. Structures.—What are "deficient" and "redundant" frames respectively? Give some outline diagrams as illustrations. (T. R.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

467. Destructors—Forced Draught.—Discuss the relative advantages of steam jet blowers and fans for producing forced blast in destructors. (Eneer.)

The use of steam as a means of obtaining a draught is advocated by some designers on the ground that the clinker does not adhere to the bars so firmly as when the blast is from a fan, and that the decomposition of the steam prevents the wearing away of the bars. The efficiency is not so good as compared with the fan. It it difficult to estimate the quantity of steam required to obtain a given draught, but it has been stated that it is five times the amount that would be used to obtain the same draught by means of a fan. It will be seen that it is more economical to use the steam for driving a fan than for direct blast; however, where there is little demand for the steam it may well be used without a fan. The amount of power used to create the air pressure for a forced draught, whether fan or steam jet, is obtained from the heat generated, and therefore it must be deducted from the amount of heat left for power purposes. ("T. Square.")

468. Girder Design.—Explain a method for determining the position of the web stiffeners in a plate girder. (J. F., *Padiham.*)

There is a considerable difference of opinion as to what is the precise function of web stiffeners in plate girders, some authorities believing that the use of stiffeners increases the torsional rigidity of the girder, thus obviating any side twisting, while others hold that they are necessary in order to prevent buckling due to shear. Should the former theory be adhered to, empirical rules only are available, and are, approximately, as follows: The stiffeners should be placed at distances of from 2 ft. 6 in. to 3 ft. apart, at and near the abutments, the pitch increasing to not more than 4 ft. at the centre, where the common practice is to use alternate tie and plate stiffeners As regards the latter theory, far more exact calculations are possible, the method being as follows: It is known that the shear forces acting upon the web can be regarded as being equivalent to tensional and compressional forces acting at an angle of 45 deg. with the horizontal. The compressional forces are those from which the required pitch is calculated. Rankine's theory of web stiffeners treats a strip of the web inclined at an angle of 45 deg. with the horizontal as a column, and if L be the distance between the angle-irons fastening the web to the flanges, then length of column = L cosec 45°. Both ends are assumed to be fixed, and the thickness of the column is obviously equal to the thickness of the web. Unit width is assumed. If now we test the column by means of the formula given below, and it is found that the intensity of compressive stress as obtained from the equation comes within the safe limit for the material, then theoretically no stiffeners are necessary. This, however, is seldom the case; so we then proceed to find what length of column will ensure a safe intensity of compressive stress.

The load on the column is usually assumed to be equal to the shear per foot-run of depth, and its width as 1 ft. Gordon's rationalised column formula is the most convenient to use, and from it, as we see below, can be obtained the length of column (measured on a line between the edges of the stiffeners at an angle of 45 deg. with the horizontal), which will not buckle under the given load.

We commence at one of the abutments, where the shear is a maximum. Then we have—

$$w = \text{load on column} = \frac{\text{shear at abutment}}{\text{depth of web}}$$

and the formula referred to is—

$$w = \frac{f_c \, A}{1 + a\left(\frac{l}{d}\right)^2}, \text{ where}$$

w = load on column
f_c = safe intensity of compressive stress for material
A = cross-sectional area of column
l = length of column
d = least dimension of column
a = a constant, varying with the section, the material and the method of end-fastening.

In this case, both ends being fixed, $a = \frac{1}{1200}$ for steel, and $\frac{1}{900}$ for wrought-iron. Hence we can obtain l, which, reduced to horizontal distance $= l \cos 45 = \frac{l}{\sqrt{2}}$. Thus we have the position of the first stiffener. Consider a numerical example. Find the necessary pitch of stiffeners in a steel-plate girder, in which the shear varies from 100 tons at the abutments to zero at the centre, the depth of web being 5 ft., and thickness being $\frac{1}{2}$ in. Then we have—

w = load on column $= \frac{100}{5} = 20$ tons

Column is 1 ft. wide

$\therefore$ Cross-sectional area $= 12 \times \frac{1}{2} = 6$ sq. in.

Also for steel, $f_c = 6\frac{1}{2}$ tons per sq. in.

least dimension $= \frac{1}{2}$ in., and $a = \frac{1}{1200}$

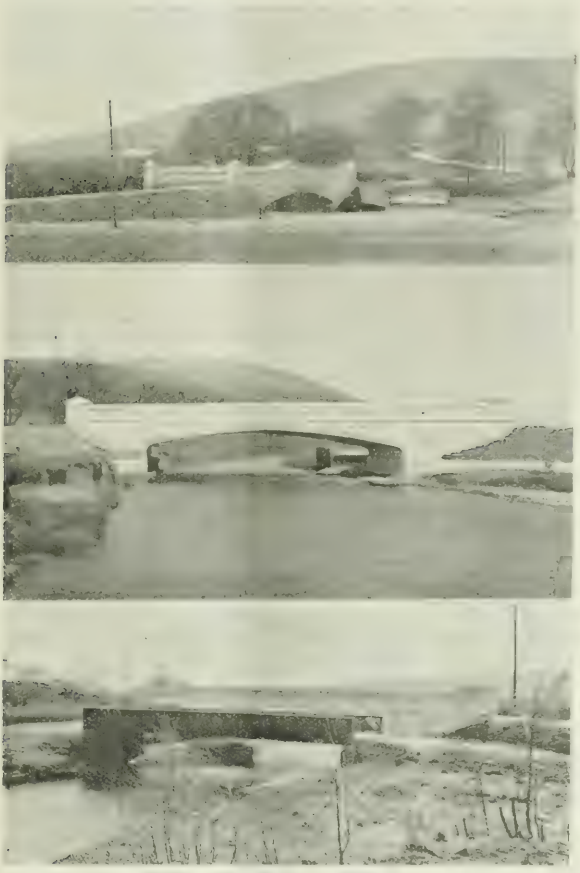
$$\therefore 20 = \frac{6\frac{1}{2} \times 6}{1 + \frac{1}{1200}\left(\frac{l}{\frac{1}{2}}\right)^2} \quad \therefore l = 16{\cdot}88 \text{ in.}$$

$\therefore$ Horizontal distance between stiffeners at abutments

$= \frac{16{\cdot}88}{1{\cdot}414} = 11{\cdot}94$ in., or approximately 1 ft.

Since the shear decreases as the distance from the abutment increases, it is not necessary to have so small a pitch for the stiffeners across the entire span, and we therefore proceed, as above, to find the position of the next stiffener, having found the shear at the required section from the diagram

of shear stress. In a girder of large span it is a laborious process to continue these calculations right to the centre of the span, and it is usual to take some fixed pitch at or near the latter, though it should not, in any case, exceed 6 ft. It should be observed that when calculating the pitch of rivets to fasten the stiffeners to the web, particularly in girders of small depth, it is sometimes necessary to increase the thickness of the web at the abutments, in order to come within the safe limits for bearing strength. This will, of course, necessitate a revision of the calculations for the pitch of the stiffeners. It has been pointed out that the above method assumes that the intensity of shear stress is uniform over the cross-section of the web, which is not the case; but the difference is negligible for all practical purposes; in fact, we have a margin on the safe side in calculations for the shearing and bearing strength of the rivets fastening the stiffener to the web, since we assume the intensity of shear stress to be equal to S_{max} throughout the cross-section. It is also usual to place a stiffener at the ends of the cross-girders carrying the roadway or other load, for it is found that the application of a concentrated load induces severe local stresses, and in addition to this consideration, the use of a stiffener ensures the more even distribution of the load over the whole of the web. (B. K., *Newport, Mon.*)



Views of Stinchar Bridge, Ayrshire.
One showing the old steel bridge.

Cement Waterproofing.—The architects for the Somerset Education Committee have been building new schools for the Langport Council. The large cement-concrete playground has been waterproofed with Pudlo. The work is now completed, and the architects report that they are very pleased with it.

FERRO-CONCRETE BRIDGE BUILDING IN AYRSHIRE.

Situated about 200 yds. from Pinwherry Station on the Glasgow and South-Western Railway between Glasgow and Stranraer, the bridge described and illustrated in the present article—which we reproduce from the February issue of *Ferro-Concrete*—carries one of the county highways over the river Stinchar, and was built to replace an old steel bridge which was of insufficient strength for modern traffic.

We give two views of the new bridge, which was built entirely in Mouchel-Hennebique ferro-concrete, and one view showing the old and new bridges side by side.

The arch span measures 65 ft. between the abutments, and consists of two arch ribs, 6 ft. deep at the springings, moulded so as to be monolithic with the parapets, the effective depth at the crown being 1 ft. 6 in. The ribs are connected transversely by beams spaced about 4 ft. apart, and the structure is completed by a continuous ferro-concrete decking slab 5 in. thick. The width of the bridge is 20 ft. between the parapets, which are continued up from the two arch ribs, and are treated in a very effective manner from the artistic point of view.

The bridge was designed by Mr. Robert Moir, then acting as the engineer to the Carrick District Committee of the Ayrshire County Council, the working details of the ferro-concrete construction having been prepared by Messrs. L. G. Mouchel & Partners, of Westminster and Glasgow. The contractors were Messrs. Gray's Ferro-Concrete Contracting Company, Limited, of Pollokshaws.

According to the requirement of the specification, the structure was calculated for a rolling load represented by two 17-ton steam rollers, or a static load of 150 lb. per square foot over the entire area of the roadway. Among those present at the [illegible] tests were representatives of the District Committee. Mr. MacGregor, the successor of Mr. Moir, who is now the surveyor to the Midlothian County Council, Mr. Livingstone, representing the contractors, and Mr. T. O. Dixon, district engineer for Scotland to Messrs. L. G. Mouchel & Partners.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

Loans for Isolation Hospitals.—At the last meeting of the County Councils Association the Parliamentary Committee reported the receipt from the assistant secretary of the Local Government Board, Mr. H. O. Stutchbury, of the following communication dealing with a request of the association that they should take steps to have the period for loans for isolation hospitals extended as soon as possible, even if this were done merely as a temporary measure in respect of buildings erected to meet the present emergency: "The board may say that, as a general rule, they regard a period of thirty years as sufficient for the repayment of loans in respect of buildings such as hospitals, and they would observe that many of the buildings which are being erected to meet the present emergency are of a temporary character for which a long term of repayment would be inappropriate. I am to add, however, that Mr. Herbert Samuel is willing, when opportunity offers, to consider the proposal that the limit of thirty years as the maximum period for the repayment of loans raised by county councils under the Local Government Act, 1888, should be reconsidered."

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible*

INQUIRIES HELD.

Boston T.C. (March 24th. Mr. R. H. Bicknell). £7,000 for the construction of a refuse destructor. The borough surveyor (Mr. G. L. Gardner) and other officials were present. At the conclusion of the inquiry the inspector stated that, although he hoped the Local Government Board would sanction the loan he must explain that, owing to the war, the corporation would not be able to get the money. In case the Local Loans Commissioners would be willing to lend it, and it would be very difficult to obtain it elsewhere. They would not be able to begin the works to provide employment until the Board's sanction had been given.

Cleethorpes U.D.C. (March 16th. Mr. Edgar Bedford). £9,250 for widening Grimsby-road, Cooper-road and Humberstone-road.—The surveyor, Mr. C. H. Westbrook, presented the engineering details of the scheme. The inspector said he was very much surprised to note that the council proposed to pay the Sidney Sussex College price of £24 to £2 10s. per yard for the land required in connection with the improvement. He would like to point out that the improvement would be of great benefit to the adjoining College estate, as a danger to the district by reason that the cottage which, he was informed, was owned about two-thirds of the land in Cleethorpes, might have given the land. He would be glad to hear on what grounds the council consented to pay for the land at all. Alderman Grant remarked that although he quite agreed with the criticisms of the inspector, the college had done all they could to get the land for the least price possible. The college had given them land for parks, and so forth, and the relations between the college and the council were satisfactory.

Derby T.C. (March 19th. Mr. Edgar Dudley). £4,500 for the purchase of property in Cheapside for the widening and improvement of the Wardwick. Referring to the Treasury's intention that local authorities must not expect to be able to borrow money just now as freely as they had done, the town clerk said the corporation were committed to the purchase of this property before any such restrictions were notified by the Government. The corporation fully recognised their obligations in this matter, and he should be sound prudence that no other application for sanction to borrow money would be made while the war lasted, unless it happened to be an application for urgent necessity. The borough surveyor (Mr. Jesse Wood) attended the inquiry with other officials.

Leicester T.C. (March 22nd. Mr. R. H. Bicknell). £1,994 and £3,817 for street improvement and works of sewerage in Lutterworth-road and Welford-road. The town clerk, Mr. H. A. Pritchard, and the borough surveyor, Mr. L. G. Mawley, were in attendance, and it was explained that the improvement of the Lutterworth-road was from Aylestone to near the borough boundary. The average width of the road at the present time was 48 ft., and the improvement would make it 60 ft. The owners on the west side of the road had given land on condition that a sewer was laid, and that was included in the scheme. The Road Board consented to make a grant of £586 on condition that the work would not be commenced until they gave sanction. The application with regard to Welford-road relates to the portions of that thoroughfare.

Lisburn U.D.C. (March 24th. Mr. P. C. Cowan). This was a resumed inquiry into the application of the Lisburn Council for a Provisional Order to enable it to acquire compulsorily other than by agreement certain lands for the purpose of extending the water supply for the urban district. At the same time the council applied for sanction to the borrowing of £6,000.—Mr. J. E. Crosadaile (Messrs. Swiney & Crosadaile) stated that, in his opinion, the catchment area would not affect the interests of the opposition, who would be amply protected. Mr. J. H. H. Swiney, M.Inst.C.E., was also examined. Several farmers in the district considered their lands would be injuriously affected if their present water supply were diminished or taken away.

Stone U.D.C. (March 23rd. Mr. R. H. Bicknell). £3,764 for the purpose of carrying out a scheme of alteration and addition to the waterworks pumping station.—Particulars were given of the existing works, and it was stated that the new work was a duplication of the existing pumping station. The estimated cost was: Borehole, £580; engine-house, £580; engine and pumps, £2,200; legal costs, £100. During the inquiry the inspector stated that there was no possibility of getting the money at present.

Worcester T.C. (March 24th. Mr. A. W. Brightmore). £10,275 for the purpose of water supply. When the Local Government Board granted the Provisional Order for the extension of the city, the question of the improvement of the water supply was raised until the council eventually determined upon a scheme of additional filtration. At a recent meeting of the council it was reported that a tender had been accepted for the work, but the firm subsequently withdrew it owing to the uncertainty of prices caused by the war. It was desired to provide two new filters with a total area of 2,400 sq. yds. The city engineer, Mr. T. Caink, stated, in the course of his evidence, that in Glasgow, where storage existed, the typhoid rate was one of the highest, while in Edinburgh, where filtration was depended upon to a greater extent, the typhoid incidence was very low.

APPLICATIONS FOR LOANS.

Audley U.D.C. £5,000 for the purpose of the gas works.

Aylesbury U.D.C. £640 for electricity extensions.

Barking U.D.C. £18,000 for electricity works extensions.

Darfield U.D.C. £16,218 for workmen's houses.

Devonport T.C. £17,000 for the extension of the technical school buildings.

East Stow R.D.C. £2,393 for the erection of workmen's houses.

Hertford T.C. £1,150 for the construction of a new road.

Long Sutton U.D.C. £500 for walling the proposed cemetery and tree planting.

Mountain Ash U.D.C. £2,650 for the Abercynon electric lighting scheme.

LOANS SANCTIONED.

Essex C.C. £870 for the purchase of a site at South Woodford for a new school.

Killarney U.D.C. £1,500 for road and footpath improvement.

Mountmellick R.D.C. £3,700 for the erection of labourers' cottages.

FORTHCOMING INQUIRIES.

TOWN PLANNING.

20. **Croydon.** (Mr. George L. Pepper)

Motors for Assistant Surveyors. — The Finance Committee of the Derry County Council have unanimously agreed to recommend the council to provide all the assistant surveyors in the county with motor bicycles, with a view to facilitating them in their work. The proposal was strongly supported by the county surveyor (Mr. C. L. Boddie), who stated that two of the surveyors were provided with motor cycles some time ago and the advantages had been very material. One of the machines had been in use now for two and a-half years, costing in maintenance £9 7s. 7d., and the mileage covered during that period was 11,745, or approximately 4,700 miles per annum.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below:—Barking's Tottenham housing and town planning schemes; Swansea roads and materials—Kesteven, Lakeside reservoir and sewage disposal—Ashby, Audley water-mains and electricity—Luton, Hampstead. Further particulars of other works projected will be found in our Local Government Board Inquiries" page.

BUILDINGS.

Bedford T.C. It is proposed to build an electricity sub-station in Campbell-road.

Gravesend T.C. It is proposed to enlarge the Central school, at an estimated cost of £800.

Isle of Wight R.D.C. A scheme estimated to cost £650 is to be submitted to the War Department and the county council for the extension of the sea wall at Yaverland.

Kesteven C.C. The county council are pressing upon the Grantham and Sleaford Rural District Councils and the Sleaford and Rackheath Urban District Councils the necessity for proceeding with the provision of isolation hospitals.

Lees (Lancs) U.D.C. The building of new mortuary and lobby, which has been approved by the Local Government Board, has been postponed for three months.

Tottenham U.D.C. The Education Committee have approved schemes for two extensions at Vale-road and Park-lane, for 900 and 750 children respectively.

Tyrone C.C. Mr. Lennon, surveyor for the northern division, has reported serious defects to Monaghan Bridge, on the road between Newtownstewart and Drumquin. The whole bridge, in his opinion, would fall in a year or two, and must be replaced at a cost of £250, to be shared by Strabane and Castlederg districts. Drumshambo Bridge, about 2 miles distant from Monaghan bridge, over the same river, is also in a very bad state, and must be renewed within the next few years.

HOUSING AND TOWN PLANNING.

Holywell R.D.C.—As the result of a communication from the Local Government Board, the proposed housing scheme will be deferred.

Swansea T.C.—The council decided recently to proceed with the erection of 500 houses on the Town Hill estate, at a cost of about £121,000. They proposed to applied to the Local Government Board for power to borrow the requisite money, and last week a letter was received from that body refusing the application on the ground that the present was not an opportune time for the borrowing of money. The Housing Committee have instructed the town clerk to bring the matter before the board with a view of seeing if they could not modify their view.

Ystradgynlais U.D.C.—It has been decided to proceed with the scheme for the erection of twenty workmen's houses at Abercrave. An application from Mr Rogers, contractor, for a bonus of £500 on account of increased cost of materials and the fact that a number of houses were ready before the proper time, has been deferred.

ROADS AND MATERIALS.

Barking U.D.C. It has been decided to metal the centre of River-road, at an estimated cost of £800.

Bispham U.D.C.—The surveyor, Mr. T. Harrop, has received instruction to prepare a scheme for widening the northern side of Red Bank-road.

Clackmannanshire C.C.—In deference to a recommendation by the Road Board, it has been decided to postpone the larger part of the road improvement scheme for 1915-16 (for which a grant had been promised), which was estimated to cost £3,420.

Dartford R.D.C.—Consideration is being given to a proposal to make up Castlestreet.

Dover R.D.C.—The surveyor, Mr. F. Sergeant, reported recently that the Military required that the old Roman road from the rear of Old Park road across the fields to Sandwich Hole should be repaired. The council had slightly repaired a part of the road elsewhere, but they had never repaired the road, and there was no foundation for a road at all. It would cost £2,000 to make a proper military road across there. He had not made an estimate for he was going to see the Road Board, and would mention the matter and see what they wanted.

Finchley U.D.C. The surveyor, Mr. C. J. Jenkin, has been asked to prepare an estimate of the cost of widening Hendon-lane, near the church gates, and also for widening the Great North road, from Walfield Bank to the county boundary, from 50 ft. to 60 ft.

Hertford T.C.—A scheme has been prepared by the borough surveyor, Mr. J. H. Jevons, for the construction of a road to connect Port Vale with North-road and the new Great Northern station. The estimated cost is £2,450, towards which the railway company will contribute £1,000.

Kesteven C.C.—It is reported that the Holland County Council have agreed to join with this council in a scheme for the improvement of the Bridge End road, at an estimated cost of £1,200 per mile. The War Office, the Treasury and the Road Board will, it is anticipated, bear a considerable proportion of the cost.

Newhaven R.D.C.—The council last week passed a resolution recommending the county council to postpone all work on the Lewes-Newhaven road at present as it prevents farmers getting men, and in that way keeps up the price of food.

Stockton R.D.C.—A scheme has been adopted for the repair of the main road between Stockton and Yarm.

Uckfield U.D.C. [illegible] connected to the [illegible] sewerage, for consideration, approved [illegible] estimated cost of £4,200.

Walton-on-Thames U.D.C.—The surveyor, Mr. R. Wilds, has received instructions to make up the first [illegible] Station-road.

Watford U.D.C.—The surveyor, Mr. D. Waterhouse, has submitted a report stating that the county surveyor, in the application for a grant from the Road Board, was including the reconstruction of Queen-street with wood paving, and of Woodford-road, St. Albans-road, Station-road, and Clarendon-road, with [illegible] macadam.

Winchester T.C. A loan of £2,600 is to be taken up for wood paving at St. Cross.

SEWERAGE AND SEWAGE DISPOSAL.

Ashby R.D.C. Plans have been prepared for the construction of sewers and a sewage outfall for part of Donisthorpe.

Audley U.D.C.—Consideration is to be given to a sewerage scheme for the district.

Christchurch T.C.—The plans and specifications prepared by the borough surveyor, Mr. H. J. Farmer, for the drainage of the added areas have been forwarded to the Local Government Board for their sanction.

Hornsey T.C.—It is proposed to construct a storm-water [illegible] between the railway bridge and Alexandra road, at an estimated cost of £450.

Sevenoaks R.D.C.—It is proposed to carry out works of sewerage at Morris Green, at an estimated cost of £1,850.

WATER, GAS, AND ELECTRICITY.

Fortar T.C. New carbonising plant is to be installed at the gasworks at an estimated cost of £10,000.

Hampstead B.C.—The council have approved a scheme, estimated to cost £17,300 for the extension of the electricity undertaking.

Poplar B.C.—A profit-sharing scheme is recommended to the council by the Electricity Committee. It begins with a general reduction of charges from April 1st, so that the council, as consumer of electricity, will benefit proportionately with other consumers. Any surplus profits will then be apportioned on a scale of percentages, including 20 per cent bonus among officers and workmen and 10 per cent to the general borough fund.

Saffron Walden T.C. The gas undertaking earned a nett profit of £839 in the last financial year.

West Ward (Westmorland) R.D.C. For many years the council have had under consideration the question

of supplying a large part of North Westmorland -an area comprising sixteen parishes—with water from one source, and last year a Local Government Board inquiry was held into a scheme for supplying the area from Blea Water Tarn, near Mardale, at an estimated cost of between £35,000 and £40,000. The council have now resolved that no further steps be taken in connection with the scheme until after the termination of the war. This decision is due to the greatly increased cost of materials and labour, and to the enhanced interest required upon borrowed money.

MISCELLANEOUS.

Middlesex C.C.—The wages of council roadmen receiving 36s. a week or less are to be increased by 2s. a week on their existing normal wage, the increase to date from March 1st last.

Paignton U.D.C.—The question of the repair of the sea wall at Preston has been under consideration owing to considerable damage which was recently sustained, and the council agreed that it would be preferable, instead of incurring the cost of the repairs, to proceed with the negotiations for the requisition of the beach, which was described as a possible valuable asset to the town.

Stoke-on-Trent T.C. — A committee has been appointed to consider the agreement with the Potteries Electric Traction Company for a renewal of the lease of the tramways.

BELGIUM TOWN PLANNING COMMITTEE.

Viscount Bryce, O.M., has consented to become president of the newly formed Belgium Town Planning Committee which has been constituted by the amalgamation of the various committees previously considering the question of the replanning of Belgium. The committee, which is under the patronage of the Belgian Government, has Mr. Raymond Unwin as chairman and Mr. Ewart G. Culpin as secretary.

Following upon the recent highly successful conference at the Guildhall, London, the next step will be the opening of a Belgian exhibition at University College, Gower-street, W.C. It is hoped that Lord Bryce will open the exhibition on April 6th, and it will remain open until the end of the month.

At the same time study circles of architects, lawyers, and others will be instituted for the consideration of the actual facts of town planning, but on the legal and technical sides; lectures and conferences will be held for municipal councillors and the general body of the public in order to educate them in these matters. University College has kindly provided studio and office accommodation.

Money is urgently needed to carry on the work, and may be addressed to the secretary at the School of Architecture, University College.

FOR OTHER ADVERTISEMENTS
See End of Paper.

URBAN DISTRICT COUNCIL OF HORNCASTLE.

ROAD MATERIAL.

The above Council invite Tenders for Supplying the following Road Material—viz.:—

390 tons (more or less) of X Granite.
270 tons (more or less) of XX Granite.
200 tons (more or less) of 2½-in. Slag.
80 tons (more or less) of ½-in. Clean Slag Chips.
20 tons (more or less) of Slag Dust.

To be delivered at Horncastle Station as and when required by the Council's Surveyor (the Contracts to be completed by 30th September next, and security for the due performance thereof must be given).

Small Samples to be sent to the Surveyor, Mr. F. Weeber, Foundry-street, Horncastle.

Forms of Tender can be obtained from the undersigned.

The Council do not bind themselves to accept the lowest or any Tender.

Sealed Tenders, marked "Road Material," must be delivered to me not later than 2 p.m. on Monday, 19th April next.

(By order)
R. W. CLITHEROW.
Clerk to the Council.

Court House, Horncastle.
March 30, 1915. (2,519)

PERSONAL.

Mr. J. C. Trounson has been appointed deputy borough surveyor of Plymouth.

Mr. William J. Cook, surveyor to the Aylesbury Rural District Council, has resigned.

Mr. T. Ingle, Colne, has been appointed highway surveyor to the Louth Rural District Council.

Mr. J. Pickup has been appointed building inspector to the Burnley Corporation in succession to Mr. T. Cross, deceased.

Mr. W. H. G. Browne, surveyor and inspector to the Bolsover Urban District Council, has been appointed supervising sanitary inspector at British Guiana.

Mr. J. G. Howard, assistant surveyor to the Berkhamsted Rural District Council, has been appointed surveyor and inspector to the Salcombe Urban District Council.

Mr. J. R. Hadfield, surveyor to the Berkhamsted Urban District Council, has received the congratulations of his council upon obtaining the diploma as an associate member of the Institution of Civil Engineers.

Mr. George D. Macniven, L.R.I.B.A., of the firm of Messrs. Greig, Fairbairn & Macniven, architects, has been appointed assistant architectural inspector to the Local Government Board for Scotland, under the Housing Acts, and more particularly in connection with the scheme for the housing of Admiralty employees at Rosyth.

Mr. F. W. Bricknell is recommended by the Works Committee of the Hull Corporation for the office of city engineer, in succession to Mr. A. E. White, who retired last year. Mr. Bricknell, who entered the service of the corporation thirty-eight years ago as a pupil, has since Mr. White retired acted as city engineer. The salary has been fixed at £750, with annual increases of £50, till the maximum is reached.

Mr. David M. Jenkins, Assoc.M.Inst.C.E., whose paper, "Notes on Extraordinary Traffic on Highways," read at last Saturday's district meeting of the Institution of Municipal and County Engineers at Cardiff, is reproduced elsewhere in this issue, was appointed borough engineer and surveyor of Neath in 1886, and subsequently water engineer and engineer to the corporation electrical undertaking. He has carried out many important works in the borough which he serves. He has acted as arbitrator in sewerage compensation cases and in boundary and other disputes, and has had considerable Parliamentary experience in connection with schemes promoted by his own and other authorities.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

EAST MIDLAND DISTRICT.

An East Midland District meeting is to be held at the Town Hall, Loughborough, on Saturday, April 10th.

Programme.

2.15 p.m.—The members and visitors will be received in the Council Chamber by the Mayor of Loughborough (Mr. W. W. Coltman, J.P.).

2.30 p.m.—To receive minutes of last meeting.
To elect district committee.
To discuss election of district representative, district chairman, and district secretary.
To consider any other general district business.

3 p.m.—Proceed in conveyances (at a charge of 1s. per person) to inspect the swimming baths, where members will be given the opportunity of inspecting an apparatus for teaching swimming, erected by Messrs. Herbert Morris, Limited, of Loughborough.
Proceed to sewage farm to inspect refuse destructor and other works.

5 p.m.—Arrive at town hall, where tea will be provided by the borough surveyor, Mr. A. H. Walker, Assoc.M.Inst.C.E.

E. H. Crump, Assoc.M.Inst.C.E.,
Hon. District Secretary.

Hinckley.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. W. H. Matthews Jones, City Engineer and Surveyor, Chester.

NORTH-EASTERN AND EASTERN DISTRICTS.

A meeting of the North-Eastern and Eastern Districts of the institution will be held at Newark-on-Trent on Saturday, April 24th.

1.45 p.m.—Meet at the Saracen's Head Hotel, and proceed to the inspection of old castle ruins. En route Ossington Coffee Palace, Trent Bridge and free library will be pointed out.

Parish church (exterior and interior). A short organ recital will be given by Mr. W. F. Wright, A.R.C.O., organist.

Old Magnus Buildings, with Tudor Hall, recently restored at a cost of £2,000 by Mr. H. W. Lockton, M.S.A. (member).

Various old buildings in Market-place.

Beaumond Cross.

New Magnus Grammar School (by the kindness of the Rev. H. Gorse, M.A., head master), designed by Mr. Lockton, and carried out at a cost of over £10,000.

5 p.m.—High tea at the Saracen's Head Hotel, at a cost of 2s. 6d. per head.

Short descriptive notes of the visits will be given by Mr. Lockton, and by Mr. P. A. Watford (member), surveyor, Claypole Rural District Council.

Members of the Yorkshire and other districts are invited to attend.

G. Bellson Chilvers,
Hon. District Secretary.

Oundle, Northants.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Tuesday, April 13th, at the Institution of Electrical Engineers, Victoria Embankment, W.C., a paper, entitled "Main Roads, Past and Present, and Modern Methods of Construction and Maintenance," will be read by Mr. Frank Grove, M.I.M. and Co.E., assistant county surveyor of Surrey, the following being a synopsis:—

Brief history of roads from the time of the Romans to the present day—Traffic requirements immediately prior to the introduction of self-propelled vehicles—Details of road construction at that time—Effects of motor traffic on the old type of roads, and some methods employed to cope therewith—Description of a few of the modern methods of road construction and maintenance employed during recent years in the county of Surrey.

The chair will be taken at 7.30 p.m.

A. S. E. Ackermann,
Secretary.

17 Victoria-street, S.W.

Town Planning Institute.—We have received a copy of the first issue of the "Proceedings" of this institute. It relates to the first of three meetings held to discuss the Ruislip-Northwood town planning scheme. The reports of all meetings can be obtained from the secretary, Mr. A. R. Potter, 4 Arundel-street, W.C., price 1s. per copy.

Buildings.

ANGLESEY.—April 7th.—For the erection of new schools, for the Education Committee.—Mr. J. Owen, county architect, Menai Bridge.

TRURO.—April 8th.—For the erection of a clock turret in steel and concrete and other works, for the corporation.—Mr. F. A. Barnes, city engineer and surveyor.

WINDSOR.—April 8th.—For the erection of bathing boxes, for the corporation.—Borough Surveyor, Almaroad, Windsor.

TRURO.—April 8th.—For the erection of a clock turret in steel and concrete, and alterations to the council chamber, for the corporation.—Mr. F. A. Barnes, city engineer.

HYTHE.—April 9th.—For building a timber-framed and corrugated-iron isolation hospital for eight beds, for the corporation.—Mr. Chris. Jones, borough surveyor, Hythe, Kent.

CORNWALL.—April 10th.—For the erection of a school, for the Education Committee.—Mr. B. C. Andrew, architect, Biddicks-court, St. Austell.

TYRONE.—April 12th.—For additions to Dungannon House, and the erection of a pavilion and medical officer's residence, for the county council.—Mr. J. A. Hunter, Lisburn.

EASINGTON.—April 13th.—For the erection of fifty houses, and the construction of streets, for the rural district council.—Mr. G. Waterhouse, architect, Council Offices.

ASHINGTON.—April 17th.—For the erection of gasworks, for the urban district council.—Messrs. W. A. Valon & Son, Caxton House, Westminster, S.W.

CHERTSEY.—April 22nd.—For the erection of an additional engine-house, gas generating house, new workshop and coal store adjoining the present pumping station, Byfleet Village, together with engine-sheds and other buildings, for the rural district council.—Mr. Charles Muggleton, Byfleet-corner, West Byfleet.

TETBURY.—April 23rd.—For sinking a borehole, for the urban district council.—Mr. H. J. Weaver, consulting engineer, Northgate Mansions, Gloucester.

GLASGOW.—April 29th.—For the wright and joiner's work in connection with the erection of a sanatorium and children's home, for the corporation. —Office of Works, 64 Cochrane-street, Glasgow.

Roads.

KEIGHLEY.—April 3rd.—For laying tar-macadam on 700 sq. yds. of roads and footpaths, for the Joint Hospital Board.—Messrs. Moore & Crabtree, Town Hall-square, Keighley.

PATRINGTON.—April 3rd.—For the supply of road stone, for the rural district council.—Mr. W. H. Snaith, surveyor, Patrington, near Hull.

RAMSEY.—April 3rd.—For the supply of tarred slag, broken granite, and granite chips, for the urban district council.—Mr. R. F. Serjeant, clerk.

TENTERDEN.—April 5th.—For the supply of granite or other approved macadam, for the rural district council.—Mr. W. L. C. Turner, district surveyor, Tenterden.

BOLTON-UPON-DEARNE.—April 5th.—For carrying out street works, for the urban district council.—Mr. J. W. Wilson, surveyor.

FOOTS CRAY.—April 5th.—For the supply of road materials, for the urban district council.—Mr. W. A. Farnham, surveyor, Sidcup.

BENTLEY.—April 5th.—For the supply of tar-macadam, whinstone and dross, for the urban district council.—Mr. R. G. Whitley, surveyor.

BILLERICAY.—April 5th.—For the supply of granite, Kentish rag, Kentish flints, gravel, screenings, sand, cartage, and man and horse hire, for the rural district council.—Mr. F. E. Ennals, surveyor, Shelley-road, Hutton, Essex.

GLASGOW.—April 6th.—For paving several streets with compressed rock asphalt, for the corporation.—Office of Public Works, 64 Cochrane-street.

SHILDON.—April 6th.—For the supply of broken whinstone, slag, and tarred whin and slag, for the urban district council.—The Surveyor.

DUMBARTONSHIRE.—April 7th.—For the supply of whinstone, for the county council.—Mr. J. F. Robertson, 179 West George-street, Glasgow.

KINGSTON-UPON-THAMES.—April 7th.—For the supply of 1,700 tons of Guernsey, Quenast, or other granite, for the corporation.—Mr. R. Hampton Clucas, borough surveyor.

HUDDERSFIELD.—April 7th.—For the supply of 490,000 creosoted Baltic red wood blocks, size 9 in. by 3 in. by 5 in. deep, for the corporation.—Mr. K. F. Campbell, borough engineer and surveyor.

HORNSEY.—April 7th.—For making up a passageway, for the town council.—Mr. E. J. Lovegrove, borough engineer and surveyor.

SWANSEA.—April 7th.—For the supply during the year to end March 31, 1916, of about 1,000 tons of tar-macadam and about 30,000 gallons of tar, for the corporation.—Borough Surveyor, 13 Somerset-place, Swansea.

HOUGHTON-LE-SPRING.—April 8th.—For the supply of machine-broken blast-furnace slag, hand-broken whinstone, slag, and blue limestone riddlings, for the rural district council.—Mr. D. Balfour, 3 St. Nicholas' Buildings, Newcastle-on-Tyne.

ALTON.—April 8th.—For steam rolling and the supply of broken granite, for the rural district council. —Mr. C. W. Maudsley, surveyor, Park-close, Alton, Hants.

BULKINGTON.—April 10th.—For the supply of broken granite and haulage, for the urban district council.—Mr. C. Blakeway, clerk, 2 Church-street, Nuneaton.

ALTON.—April 10th.—For the supply of tarred or Ayr Clee Hill basalt, for the urban district council.—Mr. G. Bertram Hartfree, surveyor, Town Hall, Alton.

MYNDDISLWYN.—April 12th.—For the construction of Ynysddu new road, for the urban district council.—Mr. E. Watkin Edwards, engineer, Council Offices, Pontllanfraith.

MALDEN & COOMBE.—April 13th.—For making 2 unclassified roads, comprising South-lane, part of, measuring 886 ft.; for paving with artificial stone slabs the footways in South-lane; and for constructing 625 yds. of 18-in. and 15-in. concrete tube, and about 82 yds. of 9-in. stoneware pipe surface-water sewer, together with manholes, for the urban district council. Mr. R. H. Jeffes, engineer and surveyor.

EXETER.—April 14th.—For doubling the tramway track in Blackboy-road, and the reconstruction of the tramway track in Pinhoe-road, including the necessary excavation, concrete foundation, paving with granite setts, and about 30 tons steel rails, for the city council.—Mr. Thos. Moulding, city engineer and surveyor.

BENFIELDSIDE.—April 17th.—For the supply of machine-broken whinstone, machine-broken slag, tarred slag-macadam, and limestone dust, for the urban district council.—The Surveyor, Council Offices, Shotley Bridge.

ISLE OF THANET.—April 21st.—For the supply of 1,533 yds. broken flints, and 1,295 tons broken granite, for the rural district council.—Mr. G. L. Butterworth, surveyor, Birchington, near Ramsgate.

Sanitary.

MANSFIELD.—April 3rd.—For laying stoneware pipe sewers, for the corporation.—Mr. T. P. Collinge, borough engineer and surveyor.

STANLEY.—April 5th.—For cleansing ashpits and removing house refuse, for the urban district council. —Mr. J. G. Ridley, clerk.

CHURCH.—April 5th.—For work of sewerage, for the urban district council.—Mr. J. B. Fallowfield, surveyor, Church, Lancs.

PRESTWICH.—April 6th.—For the construction of a storm-water drain, tube sewers, and manholes, for the urban district council.—Mr. S. H. Morgan, engineer, Prestwich, Lancs.

RUISLIP-NORTHWOOD.—April 7th.—For certain supplementary works for sewage disposal at the purification works, consisting of sedimentation tank, bacteria beds, humus tank, pipe connections, sluice gates, valves, and other fitments, for the urban district council.—Mr. H. Howard Humphreys, consulting engineer, 28 Victoria-street, Westminster, S.W.

UXBRIDGE.—April 8th.—For the construction of a sewerage scheme, for the rural district council.—Mr. J. W. Harrison, engineer and surveyor.

SWANSEA.—April 8th.—For the construction of stoneware pipe sewers, and manholes, for the corporation.—Borough Engineer.

DEWSBURY.—April 9th.—For the supply of disinfecting powder and disinfecting fluid, for the corporation.—Mr. B. Ellis, town clerk.

THURROCK.—April 19th.—For the construction of about 4 miles of stoneware and iron sewers of 9-in., 12-in. and 15-in. diameter, with manholes and other appurtenances, engine-house, screen chambers, suction tank, and about 1¼ miles of 12-in. pumping main, for the Joint Sewerage Board.—Mr. G. Midgley Taylor, engineer, Caxton House, Westminster, S.W.

RAWMARSH.—For relaying part of the main sewers in the South Ward, comprising about 700 yds. of 18-in. pipes or tubes, and 700 yds. of 9-in. pipes, with manholes, flushing chambers, and ventilation shafts, for the urban district council.—Mr. J. A. Tonge, engineer, Parkgate, Yorks.

Stores.

SHILDON.—April 6th.—For the supply of broken whinstone, slag, tarred whin and slag, concrete and freestone kerbs, sweeps and flags, cement, screws and paving bricks, sanitary pipes, disinfectants, brooms, shovels, spades, gullies, and manhole covers, for the urban district council.—Mr. J. Arthur Wood, clerk, Council Offices.

SOUTHAMPTON.—April 7th.—For the supply of stores and material, including broken granite, for the corporation.—Borough Engineer.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted † Recommended for acceptance
: Provisionally accepted

EAST PRESTON.—For the supply of tar, for the rural district council.—Mr. C. W. Leney, surveyor.—
Forbes, Abbot & Leonard, Shoreham, Sussex.—3½d. per gallon, Road Board specification No. 2, 3½d. dehydrated.
A. Dickinson & Co., Deptford.—3½d. dehydrated.
Worthing Gas Company, Worthing.—3½d. crude.
Littlehampton Gas Company, Littlehampton.—3d. crude.
Arundel Gas Company, Arundel.—3d. crude.

HAMMERSMITH.—The following tenders have been accepted by the borough council:—

Artificial Stone.—Alexander Payne Stone Company, Limited, London, W.C.

Ballast (River).—Cums, Limited, St. Dunstan's-hill, E.C.

Bricks.—J. Knowles & Co., London), Limited, St. Pancras, N.W.

Brooms and Brushes.—F. Smith & Co., Borough High-street, S.E.

Carbolic Soap and Permanganate of Potash.—Middleton Brothers, St. Georges-road, E.

Carbolic Powder.—Forbes, Abbott & Leonard, King William-street, E.C.

Carbolic Acid.—Ashcrofts, Limited, London, N.

Coal (House).—G. Hinchliffe & Co., Lloyd's avenue, E.C.

Coke.—C. Franklin, Pancras-road, N.W.

Granite.—J. Mowlem & Co., Limited, Westminster, S.W.

Harness.—Ryde & Son, Blackfriars-road, S.E.

Horses, Carts, and Men.—R. J. Greenham, Fulham, S.W.; J. Latter, College Park, N.W.

Lime and Cement.—J. Knowles & Co., London, Limited, St. Pancras, N.W.

Manure.—G. & M. Wells, Isleworth.

Oilman's Goods.—Middleton Brothers, St. George-street, E.

Stable Utensils.—C. J. Bradshaw, Hammersmith, W.

Stoneware Pipes.—J. Knowles & Co., London, Limited, St. Pancras, N.W.

Stores.—F. Bird & Co., Oxford-street, W.

Timber (Hard).—A. Stevens, London, E.

Timber (Soft).—F. H. Norman & Co., Mount Pleasant, W.C.

Turning of Wheels.—J. G. Newell, Bermondsey, S.E.

York Stone.—Bentley & Smith, Limited, Yorks.

Sulphur Candles.—Sanitas Company, Limited, Limehouse, E.

HARTISMERE.—For the supply of 700 tons of best granite and 1,200 tons of pit stone for the rural district council:—

GRANITE.

	Tons
Ellis & Everard, Peterborough	600
C. Abell, Limited, Newmarket	300
Lavender & Bateman, Sutton Bridge	500
Enderby and Stoner, Stanton Concrete Company, Enderby	1,000

PIT STONE.

	Tons
C. F. Acton, Weaponness	1,200

STEAM ROLLER.

W. J. Smeeth & Son, Rochford.

ILFORD.—Accepted for making up certain roads for the urban district council:—Mr. H. Shaw, engineer and surveyor.

Parsons & Parsons, Ilford, Audley Arden, 681 Auckland road, £332; Colombo-road, £73.

NEWPORT (Mon.).—For the execution of private street works, for the corporation:—Mr. H. Tremellyne, borough engineer.

J. H. Monks, Dock-street, £1,449.

Calno
Reg.d

THE ONLY FIRE-RESISTING FIBRE
BUILDING BOARD
MADE IN
GREAT BRITAIN

Does not Split or Crack. Bound with Cement Binder.
Tensile Strength over 300lb. to the square inch

TESTED AND CERTIFIED by the BRITISH FIRE-PREVENTION COMMITTEE.

PASSED by the L.C.C.

Fire and Damp Resisting.

Germ and Sound Proof.

Non-conductor of heat or cold.

Sanitary.

Over 5,000,000 (five million) Square Feet in use by H.M. Government.

Manufactured by Thames Mills, Purfleet, Essex

London Retail Depots:
61 Endell St., W.C. 64 Wardour St., W.
13 Greek St., W. 59 Mount Pleasant, W.C.

FIREPROOF FIBRE BUILDING-BOARDS, LTD., 26 Hart St., W.C.

There is ONE

NONSLIP STONE

and ONE only.

THE HARD YORK NONSLIP STONE CO.,

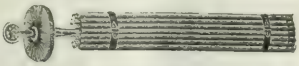
LONDON
CAXTON HOUSE,
WESTMINSTER, S.W.

(BROOKES LTD.,)
HEAD OFFICES:
HALIFAX.

MANCHESTER:
8 EXCHANGE STREET.

DRAIN AND TUBE CLEARING MACHINES

Supplied complete with specially selected MALACCA CANES, fitted with ordinary Brass Interchangeable Joints.



Also with the "FERRET" or other patent LOCKFAST JOINTS.

Cannot Slip the Thread or Unscrew. Interchangeable Self-locking.

Contractors to H.M. Government, Principal Railway Companies, Borough Councils, and Municipalities throughout the World.

IN USE BY EMINENT SANITARY EXPERTS EVERYWHERE.

We are specialists in DRAIN CLEANING and TESTING APPLIANCES. *Catalogue on application.*

CAKEBREAD, ROBEY & CO., Caroba Works, WOOD GREEN, LONDON, N.

Telegraphic Address: "SPLENDOUR, LONDON." Telephone Numbers, Palmers Green, 635 & 636.

THURNSCOE.—For the supply of broken granite, granite chippings, broken slag, slag screenings, flags, kerbs, channelling, and asphalt, for the urban district council.—Mr. T. Bull, surveyor:—
Whinstone.—Ord & Maddison, Darlington, 12s. 2d. per ton; R. Summerson & Co., Limited, Cockfield, 12s. 2d. per ton.
Slag.—J. Parker & Sons, Limited, Sheffield, 5s. 6d. per ton; J. Green & Sons, Silsden, 6s. 3d. per ton.
Slag (large). Prestwich & Sons, Dronfield, 1s. 10d. per ton.
Limestone.—J. Green & Sons, Silsden, 8s. per ton.
Tarred slag.—J. Parker & Sons, Sheffield, 12s. per ton; J. Green & Sons, Silsden, 12s. 9d. per ton.
Kerbs, &c.—C. H. Widdison, Stairfoot.
Brushes.—E. Russum & Son, Limited, Rotherham.
Pipes.—J. Parker & Sons, Limited, Sheffield.

WAKEFIELD.—For the construction of a concrete culvert in tunnel, for the corporation. Mr. J. P. Wakeford, city surveyor.
Parker & Sharp, York.

WAKEFIELD.—For relaying a sewer, for the corporation. Mr. J. P. Wakeford, city surveyor:—
Parker & Sharp, York.

WEMBLEY.—For making up two roads, for the urban district council. Mr. C. R. W. Chapman, surveyor.

	Chatsworth	Waverley.
E. Free & Sons, Maidenhead	£726	£1,041
T. Adams, Wood Green	712	1,019
E. T. Bloomfield, Tottenham	708	1,019
A. Wooster, Wealdstone	674	954
F. G. Brummell, Willesden	661	964
Willis & Powis, Wembley	633	905
Surveyor's estimate	632	887

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

APRIL

10.—Institution of Municipal and County Engineers: East Midland District Meeting at Loughborough.
13.—Society of Engineers: Mr. Frank Grove, assistant county surveyor of Surrey, on "Main Roads, Past and Present, and Modern Methods of Construction and Maintenance." Institution of Electrical Engineers, 7.30 p.m.
14.—Institute of Sanitary Engineers: Mr. W. J. E. Binnie, M.Inst.C.E., F.G.S., on "Corrosion of Iron and Steel Pipes and the Protective Methods to be Adopted." Caxton Hall, Westminster, 8 p.m.

MAY.

28.—Royal Sanitary Institute: Meeting at Shrewsbury. Discussion on "The Value of Mechanical Filters in the Purification of Water." 7.30 p.m.

APPOINTMENTS WANTED.

WANTED, a situation as Steam-roller Driver; Urban District preferred; good reference. Box 2,516, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (2,514)

TENDERS WANTED.

DEVON COUNTY COUNCIL.

SURFACE TARRING.

Tenders are invited for Surface Tarring with Refined Tar about 118 miles of Rural Main Road in North Devon.

Forms of Tender, Specification, and Schedules may be obtained from the under-signed, to whom sealed Tenders, endorsed "Surface Tarring," must be delivered not later than Monday, April 19, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

R. M. STONE,
County Surveyor
(No. 1 Division).

Minutes of Proceedings.

Royal Commission on Sewage Disposal: The Ninth Report.

It must not be imagined that with the Ninth Report of the Royal Commission on Sewage Disposal we get a solution of the problem of the treatment of trade wastes. We are practically at the beginning of a great work, which can only be done after certain very important legislative changes have been made, followed by an enormous amount of scientific research and practical work. The commissioners, having drawn attention to the filthy state of rivers and streams in manufacturing districts, urge once more the need for an alteration in the existing law, giving manufacturers the right to discharge their wastes into sewers. It is not to be expected that manufacturers will be able or willing to undertake the scientific investigations required before they can know how to render their particular wastes harmless. As long as ignorance prevails they cannot be forced by law to adopt a process which has not been invented; further, if any manufacturer should take the trouble to find out how to purify his waste, he would merely render himself and others of the same trade liable to the expense of constructing purification works. Legislation is therefore needed for the more general reception of trade wastes into sewers, for the improved supervision of rivers, and for the prosecution of scientific research.

The Ninth Report merely paves the way for further investigations, and indicates the lines upon which the work should be started. A careful but necessarily incomplete account of trade processes producing liquid wastes is given, and the means which are available, or which might be made available, for the treatment of such wastes are discussed. A good deal of interesting and valuable data has thus been collected, but the subject is so great and the number of instances in existence so overwhelming that no complete statement of the various methods possible and in use can be made. For years to come this must be a fruitful field for investigations and experiments. Scientific research will not alone solve the problem, but scientific research, plus trial and error and careful attention to what has been done up to the present, will ultimately bring about purification of our rivers, combined with general economy both to the public and to the manufacturers. For instance, at some works large settling tanks have been erected owing to the wasteful and unscientific methods adopted. Not only has there been unnecessary expense in construction, but there is permanent continuous waste of water entailed. Thus ignorance causes waste in many cases. Although it is practicable to purify some trade wastes at reasonable cost, the commissioners report that there are others of which they know no examples showing that purification is possible in the present state of knowledge. Hence it is not to be assumed that measures which are applicable to the regulation or prevention of sewage pollution are necessarily applicable to the case of trade pollution. That is to say, that it is at present impossible to suggest a single standard for trade wastes which could be universally applied [illegible] as was suggested in connection with domestic sewage in the Eighth Report. Neither is it possible to legislate for trade pollution generally without distinguishing between the different conditions affecting different trades. The commissioners have not been able to investigate perfectly the different effects produced under different local conditions by each class of trade waste. This work must be done subsequently by an authority appointed for the purpose. The commissioners do, however, think it possible and useful to suggest limits of impurity for certain trades discharging effluents, though they consider it impossible to lay down as regards each trade such a standard as would ensure complete purification of rivers, since in the present state of knowledge the attainment of such a standard would be financially impossible and therefore [illegible]. The limits of impurity suggested by the commissioners will certainly form a useful basis upon which to work, but are not intended as a final pronouncement on river purification. We must look forward to improved methods which will secure a higher degree of purification, and, moreover, under the system proposed it will be open to any rivers authority to require a higher degree of purification in any special case provided they can prove to the central authority that it is necessary and practicable.

A careful study of this most interesting and valuable report confirms the impression conveyed by preceding reports—namely, that there is the greatest need for further investigations and experiments. The commissioners freely admit that they have been unable to explore many fields that are known to require investigation, and they point out also that, even had they been able to do so, there would still remain the fresh problems arising out of social, industrial and scientific developments. This is particularly true with regard to the question of trade waste treatment, which has not hitherto received the attention which has been given to the purification of ordinary sewage, bearing in mind, moreover, that with the growth of new trade processes, and with the alteration of others, trade wastes are likely to be ever changing in character.

Extraordinary Traffic: The Surveyor's Certificate.

The surveyor's certificate being an essential preliminary to the right of a highway authority to recover extraordinary traffic expenses, it is of great importance that this document should be properly framed. It will be remembered that the right to recover only arises where it appears by the certificate that, "having regard to the average expense of repairing highways in the neighbourhood, extraordinary expenses have been incurred . . . in repairing such highway by reason of the damage caused by excessive weight . . . or extraordinary traffic" (Highways and Locomotives Amendment Act, 1878, sec. 23). There has been considerable difference of opinion as to the effect of the words "having regard to the average expense of repairing highways in the neighbourhood," and it may be useful to consider some of the more important judicial decisions and dicta with reference to the certificate in general, and this clause in particular. To take first a preliminary point: Is it necessary, in order to make the certificate valid, that it should be signed by the permanent surveyor of the highway authority properly appointed, or will it suffice if it is signed by a person who has acted as surveyor *de facto?* In the case of a Highway Board the latter was held to be sufficient, and the same rule would seem to be applicable to rural district councils who are successors of Highway Boards. There is no actual decision, however, applying the rule to district councils, urban or rural, and the prudent course, therefore, would seem to be that the certificate should be given by the duly appointed permanent surveyor. Next as to the contents of the certificate. It is apparently not enough for the surveyor to state the bald fact that extraordinary expenses have been incurred; he must set out the facts in sufficient detail to enable the highway authority to say that "it appears to them" that such is the case, and to satisfy themselves that the expense of repairing the damaged road was substantially higher than the expense incurred in respect of a like length of similar roads. And if it should be asked "Why *similar* roads?" (since the adjective is not to be found in the section) the answer is that this is an inference deduced from the judgments in the case of *Billericay Rural District Council* v. *Poplar Union* (1911, 2 K.B., 801), in which the Court expressed the opinion that the highways to be regarded are those which are in their nature fairly comparable. For instance, if it is a country lane that has been damaged, the highways taken into account in calculating the average should not include roads made up to carry heavy traffic, and *vice versâ*. In the rare event of there being no comparable highways in the district, neighbouring districts must be resorted to for the purpose of the necessary comparison.

Another important question which arose in the Billericay case was this: Assuming that the surveyor has given his certificate after duly taking into account the average expense of repairing other highways (in accordance with the foregoing principles), is this conclusive, or must the highway authority be prepared, at the trial of the case, to prove the amount of such average expense by specific evidence? In some earlier cases the Court held that the certificate was conclusive in this respect; but in the Billericay case the highway authority were worsted, and failed to recover for the very reason that no evidence of this "average expense" was forthcoming at the trial, and the Court of Appeal upheld this decision. The opinion expressed by two of the Lords Justices in their judgments in that Court is highly important. In their view the average expense of repair of neighbouring highways is not merely an element to be taken into account, but is the basis of calculation, the sum recoverable being the difference between the actual cost of repairing the damaged highway during the period in question and the average cost during a similar period of repairing an equal length of road of the same class. It may possibly be thought by some that in their interpretation of the rather vague language of the Act the Courts have practically put words into the section which are not there; but so long as these decisions remain unchallenged it is obvious that it will conduce to the successful prosecution of claims for extraordinary traffic expenses for highway authorities to adopt a system of accounts which will enable them to show the expense of repairing the various roads, or sections of roads, in their district during any given period. Such a system will also greatly facilitate the preparation of the all-important surveyor's certificate.

* * *

Liquid Chlorine for Water Treatment.

American practice in water treatment shows the growing use of liquid chlorine as a sterilising agent in place of hypochlorite. Whether it will supersede hypochlorite generally, as it has done in the case of Bubbly Creek, Chicago, is a matter of some interest. Mr. C. A. Jennings, the superintendent of the works, recently stated in a paper presented to the Illinois section of the American Waterworks Association that, as the result of one month's working at Bubbly Creek, it was clear that there was a great advantage in the use of liquid chlorine as compared with the hypochlorite treatment previously in use. With liquid chlorine there was less labour, greater rapidity of working, no loss or deterioration of chlorine, no unpleasant odour about the plant, and last, but not least, a considerable saving of expense. It is the last item which will probably be of the greatest interest, seeing that the efficiency of the best hypochlorite plants leaves little to be desired.

It must be remembered that the conditions at Bubbly Creek are peculiar. The water is of a nature that requires a very large dose of sterilising agent. The average dose of chloride of lime was 55 lb. per 1,000,000 gallons, or approximately 5·5 parts of available chlorine per 1,000,000, whereas about one-tenth of this dose suffices in many cases, and the average dose in America is about 1 part per 1,000,000. The means for getting into solution all the hypochlorites used at Bubbly Creek are known to be very poor. There were, moreover, other shortcomings, and although this was one of the earliest instances of a water supply being sterilised by means of hypochlorites, it was by no means worked on the best and most economical principles. Thus when liquid chlorine was applied, the regulation of the germicide being much more simple and accurate than was possible in the case of the old hypochlorite plant, a considerable saving of expense was effected, the relative costs being as 1 to 3 for a month's working. It is very improbable that a saving of this kind can be made where an efficient plant for the application of hypochlorite exists. However, it is to be gathered that the advantages of liquid chlorine are appreciated elsewhere. Mr. Francis F. Langley, of the staff of Messrs. Hazen, Whipple & Fuller, of New York, in a paper read recently before the American Waterworks Association, discusses the question.

Out of 110 replies received to inquiries from authorities representing water supplies of 2,000,000,000 gallons daily, it was found that in 80 per cent of the cases hypochlorite was used, and in 20 per cent liquid chlorine. It is clear from the replies received that the application of the sterilising agent is not always carried out in a scientific manner or in a reasonable manner. In America the water is generally of such a character as to need settlement, coagulation, or filtration before the dose is added; but it appears that in many cases the sterilising agent is added to water which, owing to the amount of organic

matter in suspension is quite unsuitable for treatment. We read also of such things as wooden tanks, where considerable proportion of the hypochlorite is taken up in the structure of the wood. About 37 per cent of the cities use disinfection without other treatment, although 95 per cent of the plants in question [illegible] water from rivers and lakes. Moreover, 17 per cent of the cities applied the disinfectant before coagulation. More than 20 per cent of the hypochlorite tanks are of unlined wood. We are told also that the works differ widely in design, and that some of the most modern plants [illegible] per 1,000,000 gallons; similarly the working costs differ widely. [illegible] to arrive at any definite conclusions as to the relative economy of liquid chlorine when compared with hypochlorite. All that we can gather is that liquid chlorine is being used, and that apparently it possesses certain advantages. The possible shortcomings of the process have been discussed already in these pages, and these should also be remembered.

* * *

The Port of Liverpool.

In addressing the members of the Liverpool Engineering Society recently on the "Improvement of Local Means of Communication," Mr. John A. Brodie, the city engineer, had a good deal to say which was of more than local interest. We make no apology therefore for referring to a paper which [illegible] concern the general body of municipal engineers. In taking a broad and [illegible] problems under consideration, Mr. Brodie was more than once led to the conclusion that one of the greatest impediments to their solution is the multiplicity of authorities, and the arbitrary manner in which the boundaries between the several districts have been fixed. As an example of the waste which may result from the lack of reasonable co-operation, he cited the case of the outfall sewer to take the sewage of West Derby and Walton through those districts and Bootle to the river, first proposed over fifty years ago, and now being carried out, although in the meantime an expenditure of something like £150,000 on sewage farms and separate outfalls leading to them has been entailed, to a large extent uselessly, when looked at from the point of view of present efficiency. In considering the question of the provision of suitable main lines of communication between the central business areas of the city and the outlying districts, Mr. Brodie insisted upon the vital necessity of making these thoroughfares of adequate width. In these days, having regard to the increasing volume of fast traffic, wide roads are required more than ever before, and the wise engineer, in designing main roads through unbuilt districts, will err on the side of generosity in this respect, and so save the enormous cost of future improvements. It may safely be asserted that, on the whole, the city of Liverpool has been developed with considerably more foresight than most towns, and yet during the past fifty years she has expended over £5,000,000 sterling on street improvements.

One of the most interesting parts of Mr. Brodie's paper was that which dealt with the respective prospects of the motor omnibus and the tramway as competitors for public favour. He did not incline to the view that the day of the tramway is past, but was of opinion that an improved tramway will probably continue to hold its own wherever sufficient width is provided to enable the vehicles to travel at a high rate of speed with comfort and safety to the passengers, and without causing a nuisance by noise or vibration to the frontagers. As a practical method of overcoming the nuisance from noise, Mr. Brodie suggested the use of rubber or resilient tyres, and pointed out that it is only by this means that the fast-speed motor omnibus has been successfully placed on the road. The extra cost of rubber tyres may be an objection, but it should be remembered that we are now running motor wagons which, complete with load, are equal in weight to that of a loaded tramcar, and that there is no difficulty in getting satisfactory guarantees of mileage on a 10,000 miles basis, while most of them give a life much greater. It is likely also that the total cost of running tramcars at 20 miles per hour will be lower than at 8 miles per hour, as the proportion of the first cost of the car will be less, and the [illegible] conductor will be spread over more than double the daily car mileage. The cost of current will, of course, be increased, as may also be the cost of repairs, but neither of these charges will increase in the same proportion as the car mileage. Great advantage in economy will also be found from the lower cost of upkeep of the permanent way, and the saving on this head alone may more than compensate for the additional cost of upkeep of resilient tyres, while the change in the tyres may, as in the case of motor wagons, repay itself in [illegible] vehicle.

* * *

The Engineer as Publicist.

In order that the status of the engineering profession—and particularly that of municipal engineers—may be improved, the first necessity is that the general public may be educated up to something like a true appreciation of their work. One method by which this [illegible] *Engineering Record* suggests, the publication of reports in such a form as will interest the general reader. Indeed, it may be said that in the preparation of an annual report three objects should be kept in view. First, a broad survey should be given of the leading features of the year's work, as far as possible in non-technical language, and so arranged as to be capable of easy assimilation by the members of the local authority—the vast majority of whom are laymen in regard to engineering matters—and the public at large. Next, the report should contain such details and data of a technical character as will render the report of value to other engineers and suitable for exchange. Finally, there may be an appendix of purely statistical details suitable for office reference and intended primarily for that purpose. In other words the annual report should be the medium through which the engineer keeps himself in touch with his authority, the ratepayers of his district, and his professional brethren. The suggestion is made that copies of the introductory part of the report should be sent to the local newspapers, and there is a good deal to be said for such an idea. We fear, however, that the innate modesty of most British engineers will prevent them from doing more than is absolutely necessary to give publicity to their work.

* * *

A Chair of Civic Design.

It will have been seen from the advertisement in our issue of March 26th (p. 154) that the council of the University of Liverpool are inviting applications for a Professorship of Civic Design—a course which should be widely welcomed. The successful candidate will be responsible "for the conduct and direction of research into the problems connected with the design and development of towns, such research being held to include the production of drawings of schemes for the treatment of specific problems, as well as critical and historic surveys of existing work." So interesting and practical are the possibilities this suggests that, for the information of those qualified for candidature, we give elsewhere full details as to the appointment.

Disposal of Liquid Wastes from Manufacturing Processes.

SEWAGE COMMISSION'S RECOMMENDATIONS IN NINTH REPORT.

[The Ninth Report of the Royal Commission on Sewage Disposal, which made a simultaneous appearance last week with the Final Report, deals (1) with the discharge of manufacturing wastes which for any reason cannot be taken into sewers, and (2) with the disposal of domestic refuse in rural areas. Full extracts from the Report—the commissioners' own summary of which appeared in last week's Surveyor—are appended.]

The trades or manufacturing processes with which we are concerned require the use of water in considerable quantity, and the problem with which we have to deal is the proper treatment or disposal of the water after use. In some cases, such as in tin mining or stone quarrying, the water is used merely as a mechanical carrier, with the result that, apart from the addition of much suspended matter, its quality is not materially affected. In other cases, where it is used as a solvent, as, for instance, in wool washing, the dissolved impurities are very great, and the water is rendered far more foul and polluting than strong domestic sewage. Again, other manufacturing processes give rise to liquid wastes which are highly objectionable on account of the corroding or poisonous nature of the chemicals which they contain.

The character of the waste liquor varies with each trade, and frequently with different branches of the same trade, but, speaking generally, it may be said that liquid trade waste is of a highly objectionable and polluting nature. As regards the quantity, it is to be observed that in the manufacturing districts the volume of waste liquor discharged from a single factory during a working day of ten to fourteen hours may amount to as much as 500,000 gallons, equivalent to the daily volume of domestic sewage of a town with a population of about 17,000 persons.

These general facts and the filthy state of many rivers and streams in the manufacturing districts show clearly the necessity for laws regulating the purification or disposal of liquid trade wastes.

DISCHARGE INTO SEWERS RECOMMENDED WHERE PRACTICABLE.

As we pointed out in our Third Report, the most effective, as well as most economical, means of protecting our rivers from damage due to the discharge of trade liquids is the treatment of these liquids, when practicable, at the sewage works of the local authority, and we accordingly recommended that the law should be altered so as to give manufacturers the right to discharge their waste liquors into the sewers, subject to certain conditions. We desire to repeat and emphasise this recommendation, which was in the following terms:—

"22. We are therefore of opinion that the law should be altered so as to make it the duty of the local authority to provide such sewers as are necessary to carry trade effluents as well as domestic sewage, and that the manufacturer should be given the right, subject to the observance of certain safeguards, to discharge trade effluents into the sewers of the local authority if he wishes to do so. We do not think it possible to provide by direct enactment what these safeguards should be. In each district it would probably be desirable that the local authority should frame regulations which should be subject to confirmation by a central authority. In most cases, however, these regulations could provide definite standards for the different manufacturers as regards preliminary treatment, and it appears from the evidence that the manufacturers would much prefer to have standards to work to. Power to vary the standards or to dispense with them altogether in special cases would be necessary.

"23. Although the duty of receiving trade effluents should, we think, be imposed on the local authority, cases may arise in which they should be wholly or partially relieved of it. For example, we find that in some instances the effluent discharged from the manufactory is of a composite character, the greater part of which might with advantage be easily dealt with by the manufacturer if it were kept separate. In such cases we think the manufacturer would generally be willing to adopt this course, but provision is necessary for those cases in which the local authority and manufacturer could not agree. Further, although we have received no conclusive evidence to show that there are trade effluents which could not be purified by the local authority, we do not deny the possibility of such cases arising. And it is possible that in some cases, as, for example, of a large manufactory being newly established in a small district, it might be necessary to relieve the authority of the obligation to treat the trade effluent or to enable them to exact some special contribution from the manufacturer, not only for the cost of treatment, but also towards capital expenditure.

"24. It is obvious, therefore, that some tribunal will be required for settling the differences between the local authority and the manufacturer, and for relieving the local authority in exceptional cases, either wholly or partially, of their obligation to provide sewers and disposal works of sufficient capacity for trade effluents as well as ordinary sewage."

GENERAL LEGISLATION REQUIRED.

Unfortunately, effect has not yet been given to these recommendations. Most of the larger local authorities do, in fact, receive into their sewers a large number of trade effluents of small volume without conditions, and in some cases on special conditions; and this policy has been useful in assisting the trades of their districts without materially increasing the difficulties of sewage treatment.

On the other hand, most small authorities show considerable reluctance to receive trade effluents into their sewers at all. We think that this reluctance may be partly due to the fact that in many cases the cost to the local authority of treating trade effluents is considerably in excess of the amount received in sewage rates from the traders; indeed, we have had evidence of cases in which the cost of treatment exceeds the rates paid by the traders for all purposes. In our Third Report we recommended that traders discharging into sewers should if possible comply with certain conditions as to preliminary treatment which would facilitate the final treatment of their effluents, but that no special charge should be made upon them unless for any reason they were unable to comply with those conditions. We added, however, that "power should also be granted to make a special charge even when preliminary treatment is adopted, when there are exceptional circumstances as regards volume, quality, or otherwise."

Since the issue of that report in 1903 a few local authorities have, in the absence of general legislation, obtained powers under local Acts for dealing with trade effluents. In these Acts power is given to the local authority to make a charge upon the trader when the regulations in regard to preliminary treatment, control of flow, &c., are not complied with, or where there are such exceptional circumstances as are indicated above. In one of the Acts, however, the power to charge is not so restricted. Our own additional experience and the further evidence which has been laid before us indicate that it may be desirable that local authorities should have a general power to make a charge, provided that the charges were lower in the case of effluents which had been subjected to preliminary treatment in accordance with the regulations. As we recommended in our Third Report any such charges should be fixed by agreement between the manufacturer and the local authority—or in default of agreement by the Rivers Boards, subject to appeal by either party to the central authority. Further, we would repeat our recommendation that the power to make a charge should extend to cases in which connection with the sewers already exists, subject to the terms of any agreement under which a manufacturer may have purchased the right to discharge his trade effluent into a sewer.

But, notwithstanding a general extension of the system under which purification of trade wastes is undertaken by local authorities, there will remain many cases in which manufacturers must remain responsible for the 'treatment' of their own 'trade-

[illegible] quiring further time and experiment for the elucidation [illegible] only indicate the lines on which, in our opinion, the appropriate solutions should be sought.

[illegible] river or trade, we have undertaken special experiments [illegible] all liquid trade wastes would involve prolonged [illegible] we have repeatedly recommended.

It is unlikely, in most cases, that manufacturers will be able or willing themselves to undertake the scientific investigations which are required in order to discover the best means of rendering harmless the liquids which are produced by their particular trade. As the law stands, indeed, it is not to their interest to do so, seeing that, under sec. 6 of the Rivers Pollution Prevention Act, 1876, proceedings cannot be taken against manufacturers unless the Local Government Board are satisfied, *inter alia*, that "means for rendering harmless the poisonous, noxious or polluting liquids proceeding from the processes of such manufacturers are reasonably practicable and available under all the circumstances of the case." Hence, in the case of manufacturing waste of which no practicable means of treatment are known, the manufacturer is at pains to discover such means as will no doubt confer a benefit on the community, but in so doing will render, both himself and others connected with the same trade liable not only to the expense of constructing purification works, but also to the risk of proceedings from which they would otherwise be exempt.

It is true that in some cases a manufacturer may, by adopting means of purification, derive direct and material advantage from his expenditure. Thus, when water has to be purchased, the treatment of his liquid waste may render it suitable for further use as water in the process of manufacture, and so lead to substantial economies. Or, again, treatment of waste [illegible] proportion of the material which it is the primary object of the industry to secure, or of separate by-products which have a commercial value. Thus, in the dyeing industry the effluent, after purification, can frequently be used again with advantage and economy; at tin mines and china-clay works considerable quantities of the minerals are obtained from further treatment of the washing waters; in various woollen industries the recovery of grease may recoup a part, or even the whole, of the cost of purification; while by some coal-washing processes both loss of coal and waste [illegible] are prevented. At the same time, it has to be borne in mind that the interests of manufacture are not the only consideration on which the demand for improvement rests. To most this demand some stimulus other than prospect of profit will be required.

DISTINCTION BETWEEN INDUSTRIAL AND OTHER DISTRICTS.

By sec. 6 of the Rivers Pollution Act, to which we have referred above, it is provided that the Local Government Board "... shall not give their consent to proceedings by the sanitary authority of any district which is the seat of any manufacturing industry unless they are satisfied ... that no material injury will be inflicted by such proceedings on the interests of such industry."

From the principle embodied in this enactment we do not dissent. In the special investigations which we have conducted we have considered the question of cost from this point of view, and we think that the primary object of future experiments to be carried out by the central authority should be to show, not that purification can be carried out with profit or without loss to the manufacturer, but that the cost should not be so great as to inflict material injury upon the industry.

[illegible] preamble [illegible] quoted above—"in any district which is the seat of any manufacturing industry." These words are important, as indicating that in industrial centres the special interests of manufacturers should be regarded with an indulgence which they would not receive in other places. The framers of the Act of 1876 recognised that in such centres the interests of the community are largely bound up with the interests of the manufacturers, and that to demand from manufacturers costly schemes of purification might injure the community without securing any corresponding improvement in the character of their river, which was already materially, if not hopelessly, impaired by its environment. On the other hand, it would be clearly inequitable if in a sparsely populated district a manufacturer, with a view to obtaining free of charge a supply of clean water, were to set up his [illegible] entitled to discharge polluting liquids into the stream on the ground that the cost of purification works would inflict material injury upon his industry.

[illegible]

We may, however, point out that this distinction between industrial and other districts, while it is intended to prevent the extension of industrial pollution to fresh districts, may also tend to perpetuate the conditions which prevail in manufacturing centres. The problem presented by the rivers which flow through such centres has become so complex and of such large dimensions that, under present conditions, measures of purification can be expected to do little more than act as a palliative of the grosser forms of pollution. The cost of such measures is felt, but their benefits are negative rather than positive in character. It is necessary that means of purification should at once be more efficient and more generally enforced if their cost is to be compensated by material advantages.

For example, the advantage to a riparian manufacturer of being able to obtain clean water from the river is obvious; but, owing in great measure to the difficulty of administering the existing law, the condition of many rivers is such that their water is valueless for manufacturing purposes, and the prospect of restoring by remedial measures any serviceable degree of purity to such rivers must needs appear so remote as to deter manufacturers from spending more money than they are compelled on purification works which are of no direct benefit to themselves, and of scarcely appreciable benefit to others. But if a more efficient, albeit perhaps more costly, system were in force, manufacturers would be able to save large sums which they are now compelled to spend in obtaining clean water, and would thus have a direct interest in securing the purity of their common source of supply.

In a district which is not the seat of a manufacturing industry we have said that the present law is intended to prevent the extension of industrial pollution. We do not find, however, that the operation of the law has proved efficient in this regard. In such districts there are various interests which, in our opinion, need further protection. Apart from considerations of public health, the interests of fishing and of agriculture, as well as the amenities of the river are liable to be adversely affected by pollution. We think it right to draw special attention to the protection of fishing, both in tidal and non-tidal waters, not only because in many cases it is an important industry, but because it is peculiarly liable to serious injury from pollutions which, under present conditions, neither those concerned in the industry nor the authorities who are charged with the duty of dealing with pollution have adequate power to prevent.

FISHERIES.

In our Third Report we made further recommendations in regard to the formation of Rivers or Watershed Boards throughout the country, and in our Fourth Report, which dealt more particularly with tidal waters, we recommended that the necessary power of action over the pollution of such waters should be vested in the Rivers Boards, and that Sea Fisheries Committees should be empowered to appoint one or more representatives on River Boards having tidal waters under their jurisdiction. We also supported generally the view of the Salmon Fisheries Commission that, if practicable, the powers of Salmon Conservators and other similar bodies

should be transferred to the Rivers Boards. In that event the duty of protecting fisheries should be expressly imposed on the Rivers Boards, who should be armed with such extended powers as may be necessary to deal with pollution in the interest of fishing as well as in the interests of public health.

We desire to repeat and emphasise the recommendation that fishery interests, whether in tidal or inland waters, should be represented on the Rivers Boards having control over such waters. In districts where it may not be necessary that a Rivers Board should be set up, we think that the county council should be clothed with any powers necessary for carrying out the duties of a Rivers Board, including the power to co-opt representatives of the various fishing interests.

We think, then, that both in industrial and other districts legislation can do much to reduce or prevent the pollution of rivers. The main objects of such legislation should be to secure—(1) more general reception of trade effluents into sewers, (2) improved supervision of rivers, and (3) prosecution of scientific research.

With the first of these objects we are not at the moment concerned. We have dealt with the subject at length in our Third Report, and we only refer to it here for the sake of emphasising our opinion that if the bulk of trade effluents were received into sewers, the magnitude of the problem would be so greatly reduced that a valuable incentive would be suppled for attacking the remaining difficulties.

In the same report we have considered the machinery by which improved supervision of our rivers could be secured—viz., the formation of Rivers Boards throughout the country, acting under a central authority; and in a later section of the present report we shall indicate in greater detail what should be the functions of those bodies in relation to the discharge of manufacturing wastes directly into streams.

RESEARCH BY CENTRAL AUTHORITY.

As regards scientific research, we would urge that the investigations which have been instituted by river authorities, by private individuals, and in some cases by ourselves, should be continued and extended by the central authority, whose constitution we have repeatedly recommended. We have already suggested that the staff of the central authority should include a chemist, an engineer, and a bacteriologist, all with special qualifications, and that it should be equipped with a laboratory; and we think that the function of discovering the most efficient and economical means of treating the different classes of trade liquids would form a most important branch of the duties of such an authority.

The problems to be solved are very largely financial. It must be admitted that thorough purification of liquid trade waste is frequently very costly, and that if it were enforced upon all manufacturers indiscriminately in the present state of our knowledge a vast sum of money might be expended without commensurate benefit to rivers. Large sums of money have already been spent in this way, and although the expenditure has improved the condition of rivers, we cannot help noticing that substantial amounts have been wasted through want of technical knowledge. For example, large settling tanks have had to be erected at some works owing to the wasteful and unscientific method of washing adopted. The same cleansing effect could frequently be produced with a much smaller volume of water, with a consequent saving, apart from economy of water, in the expense of constructing settling tanks.

To pave the way for further investigations we have made a general preliminary survey of the ground to be covered, and have indicated, where possible, the lines on which we think advance should be essayed. To this end we have made some inquiry into the character of the different trade effluents. We have caused average samples to be drawn and analysed by our officers, who have also carried out purification experiments on a laboratory scale with certain trade effluents, and on a large scale with two or three others. The results are given in later sections of this report, but we may make some general remarks as regards their material bearing.

GENERAL CHARACTERISTICS OF TRADE EFFLUENTS.

They show that all the more important trade wastes are liquors which contain a very considerable quantity of suspended matter, and most of them take up a large amount of oxygen when submitted to the "five days dissolved oxygen absorption" test.

We have made no experiments ourselves, and we know of none made by others, which show that the polluting power of a trade liquor of given oxygen-absorbing strength is equal to that of a domestic sewage liquor of the same oxygen-absorbing strength.

Probably the effect of the discharge of not a few trade liquors into a river differs somewhat from the discharge of domestic sewage, for their rate of absorption of oxygen may be very slow to begin with, being delayed, no doubt, by the inhibitory action of some substances in solution, and may only reach its maximum in two or three days, while with most sewages and sewage liquors the maximum rate of oxygen absorption is reached within twenty-four hours. On the other hand, there are trade wastes which closely resemble sewage as regards the rate at which they take up oxygen from water, some, indeed, which would have a more immediate effect of this kind on the river.

There are, too, certain trade wastes whose organic matter is mainly carbonaceous, which may take up oxygen from water rather rapidly without giving rise to nuisance from smell when the oxygen becomes exhausted, or nearly so.

Again, the quantity of nitrogen contained in many trade liquors is relatively small, and as other plant food constituents, such as phosphorus and potash, are doubtless present only in minute quantities, if at all, it follows that such trade liquors are unlikely to cause excessive vegetable growths of any kind in rivers. Indeed, seeing that they sometimes contain certain poisonous substances, they may destroy or inhibit vegetation in rivers, and so diminish important self-purification agencies. The poisoning of aquatic insects, worms, or of other forms of animal life, &c., is another very important effect which must be borne in mind, especially in relation to fish life.

Many trade liquors, moreover, are strongly coloured, or acid, or alkaline, or they are excessively "hard," and in such cases they may very materially impair the quality of the river water for manufacturing purposes.

Certain classes of trade liquors would have to be purified to something like the same extent as a domestic sewage if nuisance was not to be caused in the stream receiving them; and, in addition to this, they would have to comply with standards for "acidity," "alkalinity," "hardness," and poisonous metals. In other words, they would require not only full biological treatment, but special preliminary treatment in addition.

SUFFICIENT PURIFICATION NOT YET POSSIBLE IN SOME CASES.

It is practicable to purify at reasonable cost some trade waste liquors to an extent sufficient to prevent injury to the stream, but as regards others we know of no examples showing that this is possible in the present state of our knowledge.

Before making any suggestions as to the extent to which we think purification should be carried in any particular case, we proceed to give a detailed account of the chief trade processes with which our inquiry is concerned, of the liquid wastes which are caused by these processes, and of the measures which have been or could be adopted for purifying the wastes before their discharge into streams.

We think it important to make it clear that the examples of purification works cited comprised the best that we could find after consultation with the Rivers Board or county council concerned. In each case we satisfied ourselves, before drawing our own samples, that the plant was being worked with proper care and under normal conditions.

GROUPS OF TRADE WASTES.

We propose to classify these liquid wastes in three groups, as follows:—

(1) Those which are polluting by reason of the suspended matter which they carry with them.

(2) Those which are polluting mainly because of the suspended matter which they carry with them, but also to a considerable extent because of the dissolved impurities which they contain.

(3) Those which are polluting mainly because of the dissolved impurities which they contain.

[Here follows a detailed account of the more important trade processes producing waste liquids, together with a consideration of the means available for their purification.]

GENERAL SUMMARY AND CONCLUSIONS.

We [illegible] the information which [illegible] to [illegible] to the best advantage [illegible] it proper to give some fuller consideration to the questions arising out of our inquiry, with a view to suggesting improvements in administration and amendments of the existing law.

[The commission is directed with the existing law in regard to manufacturing pollution, setting out the main principles embodied in the Rivers Pollution Prevention Act, 1876. The Act, they point out, deals separately with mining pollution, but on generally similar lines.]

DEFECTS OF THE EXISTING LAW.

From a study of the provisions [illegible] evidence which has been [illegible] to the operation we have come to the conclusion that in one main respect [illegible] one hand they provide facilities for escaping the consequences of the commission of an offence; on the other hand, they do little to assist manufacturers who are anxious to avoid the offence itself.

[illegible] and inherent in the principle on which the law is conceived. If we leave [illegible] in regard to channels existing at the date of the Act [illegible] its retrospective operation—and the similar provisions in regard to mining pollution, we see that the law makes a prohibition with which most manufacturers could only comply to the letter by closing their works. In [illegible] means of securing that no poisonous, noxious or polluting liquid whatever is discharged into the stream. The law does not say that a manufacturer who is using the best practicable means of treatment is not committing an offence; it merely provides him with means for escaping prosecution.

The commission of a technical offence being practically inevitable, it was clearly judged necessary that some safeguards should be provided to protect the manufacturer who does his best to avoid committing an actual offence. These safeguards are, as we have seen, sufficiently elaborate. The prosecuting authority must obtain the consent of the Local Government Board, who are bound, before giving it, to be satisfied on various points. When that consent has been obtained, the authority must give two months' notice before proceeding, and in the meantime the manufacturer may demand that the authority shall hear his objections and decide upon them in a more or less judicial capacity; and, finally, the court might find, on expert advice, that any effective order would be impracticable on the ground of expense.

This prolonged procedure affords ample opportunities for evasion to an actual offender. On the other hand, it gives little or no guidance to the manufacturer who is ready to avoid causing pollution, but is ignorant of the best means of doing so; nor does it give him any security that, when he has constructed works to comply with present demands, he will not be compelled thereafter to comply at short notice with further and more stringent demands.

We do not suggest that the authorities who are empowered to enforce the Rivers Pollution Acts are in the habit of pressing their provisions unduly, but we do suggest that it is desirable to secure that a manufacturer shall know with what degree of purification the authorities will be satisfied, and for how long they will be satisfied with that degree.

We think that a good deal could be effected in this direction by a simple alteration. . . . It is to be observed as a rather curious feature of the Act of 1876 that, whereas the Local Government Board are required to have positive knowledge of industrial and local requirements, their functions are of a merely negative character. They may be compared in this respect to a Grand Jury: they can stop further proceedings; but when once they have given their consent to proceedings being taken the matter passes out of their hands. Thus their knowledge of the local conditions is not available at the time when it is most required—that is, when it has to be decided by the court what particular steps are necessary to prevent a recurrence of the offence.

It appears to us to be a not unreasonable proposition that, if the Local Government Board are the body best qualified to decide on the merits of a particular case in which proceedings are to be taken, they are [illegible] should be taken if the proceedings are successful.

The considerations which, under present conditions, are to guide the Local Government Board in the first instance are, broadly speaking, the same as those which are to guide experts to whom the case may be referred by the County Court in the last instance; but, whereas a central authority may be expected to observe a uniform principle in their decisions, the various County Courts and the various experts might well hold widely divergent views of local and industrial requirements. We suggest, therefore, that procedure would be at once shortened, simplified, and made more uniform if some alterations in the law were made. We think that these alterations might be designed so as to provide:—

(1) That, before proceedings are taken against a manufacturer, the Rivers Board or sanitary authority should specify the degree of purification which they [illegible]

(2) That the manufacturer should have the right of appeal to the central authority against those requirements;

(3) That the requirements [illegible] by the manufacturer or settled by the central authority, should remain in force for a definite term of years; and

(4) That, [illegible] ment of the requirements, any matters at issue (other than questions of law) should be referred by the court to the central authority.

[illegible]

We think that such alterations as we have indicated in regard to procedure would be effective in obtaining both a greater measure of security for the manufacturer and a greater measure of uniformity in administration; but further advance in both directions is, in our view, desirable. The discretion which would be given to the central authority by our proposals would doubtless be exercised within more definite limits than the discretion which is now given to the different County Courts and the expert advisers whom they may consult. But it would strengthen the hands of the central authority, and at the same time be more satisfactory both to the prosecuting authorities and to the manufacturers if general rules in regard to the degree of purification to be demanded as regards various trade wastes could be formulated and published. It is further desirable that such rules should have the force of law binding on the courts. Unless these rules were made statutory they might have little effect. For example, if a sanitary authority were to obtain the necessary consent and take proceedings on the ground that the agreed or approved requirements were not being fulfilled, the court might find that, whether those requirements were in fact being fulfilled or not, an offence against the Rivers Pollution Act was being committed, and might make an order which had no reference to such requirements. To obviate this result it is necessary that offences against the Act should be further defined, and this could best be done by reference to a standard or system of standards, provision being made to the effect that the discharge of a trade effluent which complied with the appropriate standard of purity should not be an offence against the Act.

THE PRACTICABILITY [illegible] AND STANDARDS [illegible] TRADE EFFLUENTS.

In regard to the purification of domestic sewage by local authorities, we advocated in our Eighth Report a single standard which could be modified in various local circumstances. We have now to consider whether and to what extent the principles which we laid down in regard to sewage can be made to apply to trade effluents, having regard to certain differences which exist in the character of sewage and of trade effluents, and in the conditions under which they are respectively discharged.

Differences in Character of Sewage and Trade Effluents.

The several classes of trade waste show *inter se* much greater differences of character than do the various types of sewage liquids. Indeed, as compared with trade wastes, sewage liquids may be regarded as more or less homogeneous, and from this point of view sewage pollution is but a single species of pollution—each kind of waste appearing as a parallel but quite distinct species. Hence it would be unsafe to assume that measures which are applicable to the regulation or prevention of sewage pollution are neces-

sarily applicable to the case of trade pollution, or to legislate for trade pollution generally without distinguishing between the different conditions affecting different trades.

The scheme of standards which we recommended for sewage liquids was based upon prolonged and extensive observation of the effects which various sewage liquids of known composition and volume had upon various streams of known character and volume. By carrying out experiments and observations under a great variety of local conditions we aimed at eliminating or discounting irrelevant factors, and isolating, as far as possible, the effects which are directly attributable to the discharge of the sewage liquids under review. Before we could recommend, with equal confidence, a similar scheme of graduated standards for trade effluents, we should need to investigate the different effects produced under different local conditions by each class of trade waste. So extensive an inquiry we have been unable at the time at our disposal to attempt. It must be remembered, too, that no single kind of trade liquid is discharged under so great a variety of local conditions as is sewage, and that in industrial districts, where the question of trade pollution is most serious, it frequently happens that different trade liquids are discharged at such short intervals and are so intermingled that separate estimation of their effects is impracticable.

Different Effects of Sewage and Trade Pollutions upon Fish Life.

We find that, speaking generally, manufacturing pollutions are apt to be more injurious to fish life than is sewage pollution. The effect upon fish of a discharge of sewage liquor is produced in the main not directly, but through the de-oxygenation of the water, owing to decomposition of organic constituents of the liquor. Trade liquids, on the other hand, may not only de-oxygenate the water, but they may contain constituents which are directly poisonous to fish. The Royal Commission on Salmon Fisheries reported in 1902 that:—

"Many manufactories discharge substances which are directly toxic. Among these are the chlorine from bleaching works, paper works, &c., the acids from steel works and tin-plating works, the alkalis from wool washings, the gas lime, cyanides and carbolic acid from gasworks, and the organic acid in the pot ale of distilleries. . . .

"The fine detritus of coal washings may act as an irritant to the gills of the fish, and by forming a deposit in the river bed prevents the free passage of oxygen to the ova."

We agree with this statement, and we find also that some trade liquids contain mineral poisons, such as arsenic, lead and zinc, which are undoubtedly harmful to fish. For example, we have found the following amounts present (in parts per 100,000):—

In six dye and bleach works effluents	0·01 to 0·26	arsenic (As)
In two chrome tannery effluents	0·38 and 2·13	"
In a brook water above a print and dye works ...	0·02	"
In a brook water below a print and dye works ...	0·07	"
In a brook water near a works manufacturing arsenical products ...	7·6	"
In a dye and bleach works effluent	0·21	lead (Pb)
In a lead mine effluent ...	·66	zinc (Zn).

We are unable to say what would constitute a toxic dose of any of these substances; our evidence shows that further investigation is needed into the effect upon fish of different mineral poisons. While dilution with comparatively clean water may be relied on to prevent injurious de-oxygenation, we have no information showing to what extent such dilution would be a safeguard against the effect of poisonous substances.

In the present state of our knowledge, therefore, we do not think it possible to found a scheme of graduated standards for each class of trade effluent on any adequate basis of observation, and experiment in regard to the effect of trade pollutions on streams.

Differences in regard to Methods of Treatment of Sewage and Trade Refuse.

For sewage liquids there are several known methods of treatment by a selection or combination of which the required degree of purification may be obtained. For many trade wastes, on the other hand, only one method of treatment is known or needed; for others there may be available two or three processes, each producing somewhat similar results, while in other cases no means of treatment are at present known which could be made efficient at any reasonable cost.

From this point of view graduation of standards for each class of trade waste seems neither necessary nor desirable.

Differences in General Conditions Affecting the Discharge of Sewage and Trade Wastes.

There is, moreover, a broader distinction between sewage and trade discharges which should have some bearing on the administrative aspects of the question. The discharge of sewage is a public necessity; its proper disposal is a public duty carried out by a public authority at the public expense. Provided that this service is efficient in the sense of preventing injury to the river and to the community, any saving which can be effected on this head is to the direct interest of the community, and should be encouraged on public grounds. On the other hand, the disposal of trade waste by a manufacturer is part of a process which he voluntarily carries on for his own profit. We do not suggest that he should be penalised on this account, but we think it not unreasonable to expect that a trader who uses water from a stream for his own purposes should do what he can towards returning it to the stream in a condition as pure at it was before use, even though, owing to the relative volume of the stream, the discharge of unpurified waste would cause no appreciable injury; nor do we think that a trader who derives his water from other sources could properly complain of a similar requirement, for he is not compelled to discharge into the stream, but only uses it as a convenient method of getting rid of his waste liquids. We hope, however, that in future the difficulty will be solved in the majority of these cases by the reception of the effluents into the sewers of the local authority.

Arguments have been put before us in favour of requiring, as far as is practicable, the same degree of purification from all who are competitors in the same branch of trade. We think it generally desirable to aim at securing uniformity of treatment for those engaged in any given branch of industry rather than at providing for preferential treatment in those cases where merely local conditions would seem to warrant a relaxation of the ordinary requirements.

We are, then, in favour of the principle that any standards which may be prescribed for the purification of trade wastes should be determined rather by the character of the particular trade waste to be treated, and by the means available for treating the particular waste than by the local conditions under which it is discharged. At the same time we have not lost sight of the fact that, under existing conditions, many manufacturers are so placed that they would have much greater difficulty in complying with any given standard than would others engaged in the same industry; in some cases, indeed, owing to want of space or for other reasons, they might find it impossible to comply with the standard. Again, when for any reason it is necessary to preserve a very high degree of purity in a river, a more stringent standard than would be required in normal circumstances might have to be prescribed.

We think that for each branch of industry a single standard of purity should be prescribed by the central authority, and that a departure from that standard should only be permitted if the central authority are satisfied, on the merits of the particular case, that it is necessary in the interests of the manufacturer and the locality.

A SINGLE STANDARD FOR EACH CLASS OF TRADE WASTE.

We have now to consider to what extent it is possible, in the present state of our knowledge, to indicate standards which would be appropriate to each class of trade liquid.

We think it impossible to lay down, as regards each trade, such a standard as would ensure the complete purification of rivers, since, in the present state of knowledge, the attainment of such a standard would, in many cases, be financially impracticable and therefore useless. We have thought it useful, however, to suggest limits of impurity which we believe to be now practicable, and which are based upon careful consideration of the data given in the detailed sections.

These figures will afford guidance to the central authority when established, and, although provisional

and based upon the present condition of knowledge they should, in our opinion, if prescribed, remain in force for a definite period. At the end of this period they would be subject to revision, since admittedly they are inadequate to prevent pollution of streams, and improved methods of treatment may meanwhile have been discovered.

In regard to the periods for which standards for sewage effluents should remain in force we made the following suggestion in our Eighth Report:—

"(52) We think it of importance that a standard once imposed upon a local authority should not be altered until the expiration of a definite period, in order that they may have some security as to the extent of their liability. We suggest that these periods should be prescribed by order of the central authority, and should in the case of the general or any specially stringent standard be not less than ten years from the date when the standard came into operation. In the case of relaxed standards the periods should be shorter. The less elaborate the plant required to meet a standard, the less hardship there will be in reducing the period during which the standard should remain in force; and, on the other hand, it is desirable to offer the local authorities some inducement, in the shape of a more prolonged immunity from interference, to carry purification beyond the minimum. By the end of those periods the central authority should have acquired sufficient experience to enable them to decide whether the general standard required any modification (which we suggest they should be empowered to effect on the joint report of an Officer and also to revise, where necessary, the special standards in particular cases."

We think the central authority might well consider whether a similar principle might not be applied to standards for trade effluents—viz., that in the case of those trades where a standard requiring exceptional purification is prescribed, the period might be longer than in those where only partial purification is required. In either case the period could, of course, be extended if in the meantime no improved methods of treatment had been discovered.

SUGGESTED STANDARDS FOR DIFFERENT KINDS OF TRADE WASTE

We think it important that, in order to simplify administration, the standards to be prescribed for different classes of trade wastes should be uniform with one another as far as practicable. While it is recognised that different trade liquids have widely divergent effects upon streams, and cannot always be judged by the same tests, it has been urged that such common characteristics as they possess should be made amenable to the same standard. Representations have been made to us that in all trade liquids the suspended solids (which may be regarded as common to them all) should be reduced to the same figure.

We are aware that this uniformity of standard cannot produce uniform results, either as regards cost to the manufacturer or as regards the effect upon streams. The separation of solids is a much more costly process in some trade liquids than in others, and this is a consideration which cannot be wholly disregarded. Again, the suspended matters in some trade liquids have a much more deleterious effect than the same quantity of solids in other liquids; but it is obvious that this discrepancy diminishes as the amount of solids allowed to pass into the stream decreases.

The crux of the problem lies in the figure which is selected as the standard. It has been strongly represented to us, on behalf of existing rivers authorities, that this figure should not exceed 4 parts per 100,000 for all trade liquids. We should welcome the imposition of such a standard if we were satisfied that it could be met at reasonable cost. Evidence has been brought before us with a view to showing that suspended solids can be reduced to this degree. But we think it necessary to point out that the procedure which we propose to recommend differs in some important respects from the procedure at present adopted for the enforcement of the Rivers Pollution Prevention Acts. River authorities, under existing conditions, exercise a wide discretion in instituting proceedings under the Acts, and they must needs exercise discretion in the absence of a more definite guide than "the best practicable and reasonably available means." On the other hand, the manufacturer desires to know more definitely what is required of him. This he will gain from the setting up of a standard, but the converse of this proposition is that a standard once set must be rigidly adhered to. We do not suggest as a general rule that prosecution should follow a single infringement of the standard, but we contemplate that in the event of prosecution a single infringement should transfer the burden of proof to the manufacturer. Hence a standard thus rigidly enforced cannot be set at a figure which can only be reached under the most favourable conditions. If a manufacturer is liable to be judged by his worst results he must for his own sake aim at producing average results which are better by a considerable margin than the prescribed standard. It follows that under the system which we contemplate any standard which we may suggest will in practice be much more stringent than would appear at first sight.

It will be seen, then, in the case of most trade liquids under review we propose a standard for suspended solids of 4 parts per 100,000, but in some cases we are prepared to suggest a more stringent a standard, because we are not satisfied that it could be uniformly attained at reasonable cost. We cannot emphasise too strongly, however, that a standard will fail of its results, too stringent a standard will fail in its inception, and the failure will discredit the whole principle of standards which

At the same time it must be borne in mind that our suggestions are far from being intended as a final pronouncement on river purification. We look forward to a time when improved methods will secure generally a still greater measure of purification, and in the meantime we would point out that under the system which we propose it will be open to any rivers authority in specific cases where they are satisfied that a higher degree of purification either attainable, or has in fact been regularly attained, to require a higher degree of purification than we have indicated for particular trades, if they can satisfy the central authority that it is necessary and practicable.

We find that the different trade liquids which we have examined make themselves naturally into the following classes:—

(A) Those for which efficient purification is practicable.

(B) Those for which efficient purification is not in the present state of knowledge practicable.

In Class A we include waste liquids resulting from—

(i.) Coal washing.
Tin mining.
Lead mining.
Chalk washing.
Stone quarrying.
Stone working.
Wood pulp paper works.

(ii.) Brewing.
Malting.
Distilling.
Tin plating.
Galvanising.
Wool drawing.
Shale oil distillation.
Wool scouring.
Tanning.
Leather dressing.
Fellmongering.
Dairying.

In these cases dissolved impurities could also be removed.

In Class B we include waste liquids resulting from—

(i.) Bleaching.
Waste bleaching.
Paper works (except where paper is made from wood pulp only).
Cotton dyeing.
Cotton printing.
Woollen dyeing.
Woollen piece and yarn scouring with dye liquor.

(ii.) Sulphite cellulose manufacture.
Gas and coke production.

Although no practicable means are known for rendering completely harmless the liquids included in this class, nearly all of them can be, and are, considerably improved by clarification.

We have placed sulphite cellulose liquor and spent gas liquor in a separate sub-division because we are not aware of any method of so treating them that

the effluents could properly be discharged into streams.

Class A.

(i.) In this subdivision, as we have pointed out above, reduction to a low figure of the solids in suspension may be regarded as efficient purification, and this can be effected by adequate settlement.

Coal Washing.—We think that the effluent should not contain more than 4 parts of suspended solids per 100,000. In a number of cases this standard might have to be relaxed.

Tin, Lead and Zinc Mines, Chinaclay Works, Slate Quarries, and Stone Polishing Works. Here we suggest provisionally a standard of 6 parts suspended solids per 100,000. So far as our evidence shows, reduction of suspended solids to this extent should obviate danger to cattle or fish from poisoning by lead, tin, antimony or arsenic. There are, however, cases in which no interests other than those of the particular industry are affected by the discharge of the waste waters. If it can be shown—*e.g.*, in the case of small streams near to the sea, which are not used for fishing, for navigation, for watering cattle, or for manufacturing purposes—that no damage is caused by the discharge of waste waters without treatment, we think that the standard might be relaxed or wholly dispensed with.

Paper Mills where Wood Pulp Alone is Used. In this case the effluent should not contain more than 4 parts suspended solids per 100,000.

(ii.) In this sub-division reduction of dissolved as well as suspended impurities is necessary.

Breweries and Maltings.—We suggest that the effluents should contain not more than 4 parts per 100,000 suspended solids, and should take up not more than 4 parts per 100,000 dissolved oxygen in five days.

Distilleries.—For the various methods of treating this waste we refer to our Sixth Report. Since the issue of that report we have kept under observation plants which were erected on the lines which we recommended, and have found them both efficient and economically practicable. We recommend a standard of 3 parts of suspended solids and 2 parts dissolved oxygen absorption in five days. (This corresponds with the general standard which we have suggested for sewage effluents.)

Tin Plating, Galvanising and Wire Drawing. These wastes are strongly acid from mineral acid, and contain much iron in solution. The stronger liquids should not in any circumstances be allowed to discharge into streams. The wash waters should be neutralised and settled. We suggest that the standard for these wash waters should be 6 parts per 100,000 suspended solids. Even after compliance with this standard, a somewhat yellow and colloidal liquid might result. It might possibly have to be softened before discharge, but we do not think it necessary at present to suggest any standard of hardness.

Shale Oil Distillation.—The standards which we suggest are 4 parts per 100,000 suspended solids, and 4 parts per 100,000 dissolved oxygen absorption in five days.

Wool-scouring Liquor.—Though the precipitation liquor obtained by subjecting wool-scouring liquor to direct precipitation is practically free from fat, it remains very strongly organic, and may be regarded as similar to a highly concentrated sewage liquor; and the same may be said of the septic tank liquor from wool suds, which also contains much sulphuretted hydrogen. For this reason we consider that the liquor should be looked upon as a sewage and purified biologically. This treatment has so far only been carried out in the laboratory, but we are of opinion that it is practicable at a reasonable cost, and, subject to our conclusion being verified by experiments on a large scale, we recommend a standard of 4 parts suspended solids and 4 parts dissolved oxygen absorption in five days. Pending such experiments we would suggest for this type of precipitation liquor clarification down to 6 parts of suspended solids per 100,000.

Tannery Waste, Leather Dressings' Waste and Manufacturers' Waste.—These wastes are also highly polluting, and contain much organic matter of animal origin in solution. Our observations in regard to the treatment of wool suds are equally applicable to these wastes, and we make a similar suggestion in regard to a standard—viz., 4 parts suspended solids and 4 parts dissolved oxygen taken up in five days.

Dairy Waste. Here, too, our observations on wool suds are applicable. We suggest as a standard 4 parts suspended solids and 4 parts dissolved oxygen absorption in five days.

Class B.

We now come to that class of trade waste in regard to which we are not in a position to say that efficient means of purification (such as would render them "harmless") are reasonably practicable and available. As we have said, however, some of them—Class B (i.)—are, according to present knowledge, capable of being considerably improved, and it will be useful to indicate to what extent improvement has been found to be practicable.

(i.) *Bleaching.*—In this waste the polluting matter is mainly in solution, but some improvement would be effected by reduction of suspended solids. We suggest that it should not show more than 6 parts suspended solids. Systematic experiments on a large scale would be necessary before suggesting any standard based on the absorption of oxygen.

Waste Bleaching.—The waste liquor from this trade is of the same nature as that from bleaching, but it may contain a good deal of soap as additions. We suggest a standard of 6 parts suspended solids per 100,000. Systematic experiments on a large scale are also required here.

Paper Works (Esparto and Rag Paper, Esparto and Wood Pulp Paper).—The liquid portion of most of these wastes is, as a rule, considerably weaker than that of bleach wastes, but we have found one instance where it was equally strong (owing, probably, to a less abundant water supply). Here, too, systematic experiments on a large scale are necessary. In the meantime we can only suggest a standard similar to that proposed for bleach wastes—viz., 6 parts suspended solids.

Paper Works (Brown Paper and Wall Paper).—For the waste liquors from these works we think that a standard of 6 parts of suspended matter would suffice at the present time.

Cotton Dyeing and Cotton Printing.—Compared with many other wastes, these are not very polluting, but their volume is large. Although most of their oxygen-absorbing power is due to dissolved impurities, considerable improvement is effected by clarification. We suggest as standards 4 parts suspended solids for cotton-dye liquor, and 6 parts for the liquor from print works.

Woollen Dyeing, Piece and Yarn Scouring and Blanket Scouring Liquors (carrying either separately, or in any combination).—Though these wastes are not usually concentrated, their liquid portion is, as a rule, of an oxygen-absorbing and putrescent nature. Clarification produces considerable improvement. As a standard we suggest 4 parts suspended solids per 100,000.

Wool Scouring with Piece and Yarn Scouring and Dye Liquors.—Wool scouring liquor or wool suds when unmixed with other wastes forms the subject of a later paragraph. It is an exceedingly polluting liquid, and when it is combined with those discussed in the preceding paragraph it adds considerably to their strength. If, however, all four liquors, as produced together at the works, are carefully mixed, it is possible to obtain, with the aid of good precipitation, a non-putrescible effluent which does not take up oxygen at an excessive rate. The standard which we suggest is 4 parts suspended solids.

Manufacture of Sulphite Cellulose. So far as we are aware, there are only two works in this country from which either the waste liquid produced by this process or the more dilute washings are discharged into a stream. We are unable to suggest a standard appropriate to the waste liquid, but we think that neither the liquor itself nor the first washings should be discharged into a stream.

Spent Gas Liquor.—Here, too, we are unable to suggest a limit of purification. In no circumstances should the liquor be discharged untreated into a stream. In some cases purification by percolation through "bings" may be sufficient to permit the discharge of an effluent, but we can make no general pronouncement on the point. Where no bings exist, biological treatment on the lines suggested by Dr. Fowler will lessen very materially the polluting power of the liquor. Evaporation appears to be the only other practicable alternative at the present time.

The information which we have set out above is obviously incomplete. It does not extend even to all existing trade processes whereby polluting liquids are produced, though it includes the most important. And it is to be anticipated that new processes will

commercially be carried out operations which create a demand for new means of purification or a demand which could not be economically satisfied by any system of treatment with which we could [illegible]

We do not think it necessary that the central authority should forthwith proceed to prescribe a complete set of standards for all known kinds of trade waste, but we think it eminently desirable that a general standard should be prescribed in all cases where its efficacy and practicability have been in some measure tested by experience. We are confirmed in our view inasmuch as the West Riding of Yorkshire Rivers Board, the Mersey and Irwell, and the Ribble Joint Committees, and the Thames Conservancy Board have progressively employed for their own guidance working rules which are in the nature of standards. It may, however, be necessary to extend the provisions of particular standards by existing and by new processes for which no standard can as yet be fixed.

In the case of some trade wastes additional standards may have to be imposed—*e.g.*, standards of hardness and of "caustic" alkalinity or acidity, or a requirement of neutrality, for the effluents from various branches of the cotton, woollen and paper trades, and from metal works; a standard for arsenic or other poisonous metal for trades in which those substances are used or mined; an oil-film standard for the wastes from oil, gas, grease, or soap works, &c. Some further investigation may be required before such standards—or some of them—can properly be laid down.

These standards should, in our opinion, be looked upon for the most part as special standards, applicable only to certain rivers or reaches of rivers where local circumstances call for them. It is important, however, that the necessity for imposing them in special cases should be borne in mind when the general standard is being considered, for in some cases the special standard may be required more urgently than the general standard. Several manufacturers have, for instance, urged that the "softness" of a river water is of greater moment to them than its organic purity. It will be necessary also to have special regard to the protection of drinking waters against mineral poisons.

Alteration of existing law.

We may now set out in greater detail the proposed amendments of the existing law which have been foreshadowed in the earlier sections of this report. We recommend that the law should be altered so as to provide as follows:—

1. The central authority may by Order prescribe a general standard for effluents produced by any trade process therein defined, the standard to remain in force for a period to be specified in the Order. The Order shall be published in the London Gazette and a copy of it shall be sent to every rivers board, county council, and sanitary authority.*

2. Where a general standard has been thus prescribed, the authority before taking proceedings shall serve a notice on the manufacturer specifying the requirements of the general standard and the period within which the requirements are to be complied with. After the expiration of that period proceedings may be taken against him for non-compliance with the notice (but on no other ground†), and the consent of the central authority shall not be required to such proceedings. The proceedings should not be taken in a County Court for an Order, but in a Court of Summary Jurisdiction for a penalty. The Court may extend the period in which the requirements are to be complied with, and if they consider that it is doubtful whether the notice can reasonably be complied with they shall remit the question to the central authority, who shall confirm, or modify, or cancel the requirements, and who may fix a period during which the requirements as confirmed or modified shall be in force or shall be cancelled, as the case may be. The central authority may from time to time extend such period, but on the expiration of the period the requirements of the general standard shall be deemed to be again in force in regard to the works in question.

3. Where no general standard has been prescribed, the authority, before taking proceedings, shall serve a notice on the manufacturer specifying the degree of purification which they propose to require, certifying that means are available for meeting their requirements, and prescribing the period within which their requirements are to be met. Within one month of the service of the notice, the manufacturer may appeal to the central authority against the notice. If he does not appeal, proceedings may be taken against him after the expiration of the prescribed period as if the requirements of the notice were a general standard in force in regard to his works.

If he appeals the central authority shall confirm, or modify, or cancel the requirements of the sanitary authority. If the central authority confirm or modify the requirements, such requirements as confirmed or modified shall be deemed to be the standard in force in regard to the works of that manufacturer for such period as the central authority shall specify. The central authority may also extend the period within which the requirements must be complied with, and on the expiration of such period, as prescribed or extended, proceedings may be taken without the consent of the central authority for the recovery of a penalty for non-compliance with the standard in force. If the central authority cancel the requirements for a period, no proceedings shall be taken within that period.

4. Where a general standard has been prescribed, but for any reason the authority propose to require of any manufacturer a higher degree of purification than is required by the standard, the authority shall also set out in the notice the requirements of the general standard, and the reasons for requiring the higher degree of purification. In all other respects the procedure shall be as if no general standard were in force.

5. The authority shall be required to prepare an annual report on the administration of the Rivers Pollution Prevention Acts within their jurisdiction, including particulars of all requirements made by them under the Act, whether appealed against or not, and to submit a copy thereof to the central authority.

6. Where a Rivers Board is constituted for any area, the authority for the purpose of enforcing the Rivers Pollution Prevention Acts in that area shall be the Rivers Board. The order constituting the Rivers Board shall provide for the adequate representation on the Rivers Board of any fishing interests concerned.

7. Where no Rivers Board has been constituted, the authority for the purpose of enforcing the Rivers Pollution Prevention Acts shall be the county council, who should act through a Rivers Committee, and the central authority may, by Provisional Order, confer or impose upon the Rivers Committee any powers or duties of a Rivers Board, including the co-optation of representatives of any fishing interests for the said purposes.

New sources of pollution.

Representations have been made to us that the law should be altered with a view to the prevention or regulation of the establishment of new sources of pollution. It has been suggested that every person who proposes to set up works whereby liquid refuse might be discharged into a stream should be required to give notice of his intention to the sanitary authority or Rivers Board, specifying what steps he proposes to take to prevent such liquid refuse from polluting the stream; that the sanitary authority or Rivers Board should have power (subject to appeal to the central authority) to disapprove the proposals; and that any person failing to give notice or commencing to discharge liquid refuse after his proposals have been disapproved should incur a penalty.

We are fully in sympathy with the object of taking measures in advance for the prevention of pollution, but we think that the suggested procedure might involve needless interference with manufacturers. We do not therefore recommend that the law should be altered except to this extent—that the manufacturer proposing to establish new works from which liquid refuse would be discharged into a stream should be required, under penalty, to give to the Rivers Board as long notice as possible, and at least a month's notice, before commencing to discharge. The Rivers Board would then indicate to him the degree of purification which would probably be required of him.

We do not think that a penalty other than for failure to give notice or for actual infringement of a standard should be imposed.

Power of entry.

We repeat the recommendation contained in paragraph 59 of our Eighth Report, which we think

* This expression includes rivers boards, county councils, and joint committees of county councils.

† *I.e.*, not on the ground that he is discharging a "poisonous, noxious, or polluting liquid," but only on the ground that his effluent infringes the particular standard.

should extend to entry on the purification works of manufacturers.

"(59) We think that the officers of the central authority and of the Rivers Boards should have statutory authority to enter upon lands at any time without notice for the purpose of inspecting works and rivers and taking samples of the liquor or effluent and river water wherever they can be obtained. The Rivers Pollution Prevention Act, 1876, contains no provision on this subject, but reference may be made to secs. 16 and 17 of the Alkali Works Regulation Act, 1881, sec. 98 of the Thames Conservancy Act, 1899, and sec. 7 of the Middlesex County Council Act, 1906. In the Mersey and Irwell Joint Committee Act, 1892 (sec. 10) and the West Riding of Yorkshire Rivers Act, 1894, the power to take samples is limited to the point at which the effluent enters the stream. We think the limitation is undesirable."

We recommend further that manufacturers should be required under penalty to provide facilities for taking samples of effluent at the point or points where it leaves their premises.

MINE WATER.

We have already referred to the exemption which is conferred by the Rivers Pollution Prevention Act, 1876, in regard to waters proceeding from any mine "in the same condition as that in which it has been drained or raised from such mine." We are not aware of the circumstances to which this exemption was due. We have received some evidence of the pollution caused by some mine waters of this character, which, in many cases, continues after the mine has ceased to be worked. But our evidence is not sufficient to enable us to make any general recommendation in regard to preventing this form of pollution. Under the system which we have suggested it would be open to a sanitary authority to demand purification of such waters subject to appeal to the central authority, who would be able to consider each case on its merits.

THE NEED FOR FURTHER EXPERIMENTS.

In this and in previous reports we have repeatedly drawn attention to the need for continuous and systematic research in all branches of the wide subject with which we have been called upon to deal. Our labours have extended over a period far exceeding the customary span of a temporary commission, yet we have been unable to explore many fields that are known to require investigation. Were we to continue our labours until we had covered all known fields of inquiry, we should still be faced with fresh problems arising out of social, industrial and scientific developments. We have recommended, in the constitution of a central authority, the setting up of permanent machinery for carrying on the work of investigation, and we would express the hope that if there must be an interval before this machinery can come into operation, there will be devised some method, not requiring legislation, by which research can in the meantime be continued on the lines which we have indicated in our several reports.

Further investigation is needed in regard to the treatment and disposal both of sewage and trade wastes. We are aware that local authorities, manufacturers and others conduct experiments from time to time in regard to particular points of difficulty, but we are impressed with the need of some independent authority which could not only test and coordinate the results of such experiments, but would itself seek the solution of problems which individual enterprise has not yet attacked. We are convinced that in this way great improvement in sanitation concurrently with substantial economies could be secured, and we are therefore confident that the co-operation both of local authorities and manufacturers can be relied on to give and of great value to the work of progressive research.

Cairo Drainage Scheme.—The inauguration of this work, which was first taken seriously in hand in 1907, was performed on March 22nd by the Minister of Public Works. The sewage from each of the sixty-three sections into which the area dealt with is divided is, in the first place, forced by ejectors into a main sewer, and after gravitating for a distance of [illegible] is pumped for a distance of about [illegible] the Nile at Kherda. The [illegible] the complete [illegible] is described [illegible] and on this [illegible] works out at about £E2 per head.

LUBRICATION OF INTERNAL COMBUSTION ENGINES.

Among the patents recently granted is No. 15374 to Mr. C. H. Cooper, M.Inst.C.E., borough engineer of Wimbledon, for "Improvements in and Apparatus for Lubricating Internal Combustion Engines."

Most causes of trouble in internal combustion engines have been overcome. Some of the devices, however, introduced for lubricating the pistons of these engines insure such a distribution of lubricant to the various pistons as to prevent seizing, with its accompanying dangers, or excess of carbon deposit due to over-oiling.

Mr. Cooper appears to have been the victim of the troubles that beset the motor cycle, whether such troubles were due to an absence of direction signs or to the internal complaints of the animal itself. The conclusions he has arrived at as regards lubrication are:—

(1) That lubricant should be admitted to the piston at such period in the engine's cycle as will insure a minimum amount being present when the explosion takes place.

(2) That the supply of lubricant to each piston should be independently controlled.

His device for affecting these desiderata contains lubricant under pressure while the amount of such lubricant admitted to the piston is controlled by the valve marked **E** on the accompanying plan; this valve also controls the moment when the lubricant is admitted on to the piston—that is, at the end of the explosion stroke—so that the lubricant is evenly distributed before the next explosion takes place. Valve E is actuated by a cam L on the magnet's shaft. This cam revolves in a slide J, the

Fig. 2.

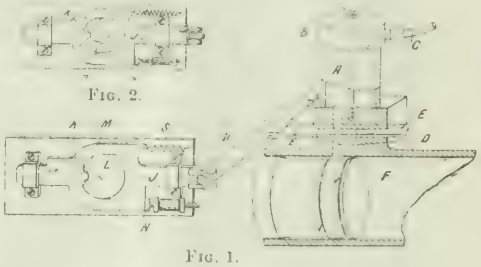

Fig. 1.

position of which is controlled by an adjustable stop N, the adjustment of which is regulated by a sleeve screw. The slide is pressed against the adjustable stop by a spring S. As placed in Fig. 2, the cam can revolve without engaging the slide, so that valve E remains closed. If the stop N is released, as shown in Fig. 1, the cam engages the slide so as to cause the slide to reciprocate; these reciprocations are transmitted by lever H so as to actuate valve E, the amount of which this valve opens, and consequently the amount of lubricant admitted to the piston, is controlled by stop N.

The plan shows the device applied to one cylinder only. In the case of two or more cylinders each will have an independent slide and control, all of which may be worked off the same cam, provided that each slide is placed at such a distance as to admit of the supply of lubricant at the desired period.

The device [illegible] is in addition to the [illegible] includes the following:

(1) Lubrication takes place [illegible] when the engine is at work, so that there is no need to handle taps or pumps—a feature every motorist will appreciate.

(2) The device will admit of grease being used.

(3) As the lubricant is admitted on to the piston, better distribution is effected than in the splash system, where the lubricant has to work up and round the piston.

We see from the provisional applications that Mr. Cooper has designed various methods of applying the principle [illegible] more complex than that now described. We wish Mr. Cooper every success with what appears to be a [illegible] portant improvement in the engine which is now universally used.

Extraordinary Traffic.

DISCUSSION OF MR. D. M. JENKINS' PAPER.

The paper on Extraordinary Traffic [illegible] by Mr. D. M. Jenkins, Assoc.M.Inst.C.E., Engineer and Surveyor to the Neath Rural District Council, at the recent South Wales District Meeting of the Institution of Municipal and County Engineers, at Cardiff, was printed in our issue of March 26, page 463. The paper was considered [illegible] Engineers and Surveyors.

Mr. Thomas (Mr. W. Harper Carey, Engineer and Surveyor to the Cardiff Rural District Council) said he would be glad to hear the opinions of members on the question of extraordinary traffic claims.

Mr. C. A. Phillips (Aberdare) said [illegible] Mr. Jenkins on the very full manner in which he had dealt with the matter. The paper would be very helpful to members who had to deal with claims for extraordinary traffic. Anyone who had to prepare such a claim would find the paper very helpful. Personally he had had to deal with a claim for extraordinary traffic which was started by the previous [illegible] from. Experience had taught him a very valuable lesson in preparing his claim, and also in the [illegible] to lay before the court. In the claim he had referred to [illegible] really all they [illegible] was cut out because sufficient details of the expenditure had not been kept. The question seemed to [illegible] As the author pointed out, on main and arterial roads the [illegible] up their roads to such a standard as would carry [illegible] Rhymney and [illegible] passed in Glamorgan, tracks of a very [illegible] to the roads and [illegible] that the roads ordinarily were called upon to carry [illegible] against any particular traffic unless in connection with any works, [illegible] Still there were [illegible] character which often got damaged by traffic, which it was perhaps [illegible] such as the cutting down and hauling away of timber [illegible] about 6 or 7 miles away from Cardiff. [illegible] road was much damaged by [illegible] to the [illegible] large reservoir at Pontsticill. Mr. Harper might be able to tell them something about [illegible] He had been connected with the preparation of claims in cases of extraordinary traffic, and his experience had led him to the conclusion that it was much better to do everything [illegible] agree with their adversary. Directly the extraordinary traffic began they should try to arrange the basis upon which payment for the repairing of the damage done could be made. At the same time it was well to keep very careful records of the cost and also of the traffic, so as to be able to lay them before the court. In each case he had had to deal with, he thought without exception, they had been able to arrange with the parties who were damaging the road, and, taking them generally, he thought the arrangements come to had been fair, and they had avoided a large expenditure in law costs. He thought he was right in saying that courts, as a rule, were not sympathetic towards claims for extraordinary traffic.

Mr. H. C. Rimell (Cardiff) explained that Mr. Priestley, waterworks engineer of Cardiff, who was unable to attend the meeting, had requested him to read a statement which he had prepared on the paper. Mr. Priestley stated that the author mentioned especially a case which had come within his own knowledge in his district, where damages were obtained for the extraordinary traffic caused in the conveyance of materials for the construction of a service reservoir. This reservoir was, he gathered, outside the borough of Neath; therefore there would be no additional rates payable in respect thereof to the town, which would not in any way benefit therefrom. In these circumstances the corporation no doubt felt justified in obtaining compensation for the considerable expense to which they had been put owing to the undoubtedly extraordinary traffic upon their roads. He would give them an instance, or rather instances, of similar extraordinary traffic caused by [illegible] him in the neighbourhood of Cardiff, the two reservoirs being in the districts of separate authorities. He was informed that application for payment would be made in each instance with regard to the extra traffic caused during construction on the roads leading to these reservoirs, but in neither case was an actual claim made, nor proceedings taken. Circumstances were different from those in the case mentioned by Mr. Jenkins, as in both instances the [illegible] district authorities. The rates were, therefore, increased in each district, and in addition thereto the reservoirs were being built for the benefit of the ratepayers within the respective districts. These circumstances, he maintained, should be taken into [illegible] to make a claim for extraordinary traffic, and presumably in each of the cases mentioned this fact was not forgotten, or he would probably have received a demand. He would ask Mr. Jenkins to give him his opinion upon the cases which he had mentioned, and the circumstances [illegible] making a claim. It would be interesting to know what proportion of the claim made was actually received, but there might be good reasons why Mr. Jenkins should not feel justified in giving this information.

Mr. L. Holmes (Cardiff) said he was afraid the case referred to by Mr. Phillips had not gone on very far yet. They were still busy cutting up the road. They had been very careful to do as Mr. Jenkins advised, and keep records of damage.

Mr. W. L. Harper (Brecon County) observed that the question of extraordinary traffic was very difficult. He thought it was easier now than in days past because they had had practically to take everything which came upon the roads, with the exception of new works and things of a temporary character. They suffered in his county a good deal from timber hauling. They brought a case some years ago which they lost, and his county did not seem inclined to go on with claims. They said "the timber had been rated for years, and if any damage is done when it is hauled away it is best to put up with it." He had one case when he happened to be a contractor's engineer where they paid about 12 per cent of what was actually claimed, which the county surveyor accepted. If the case had gone on he thought the contractor would have won it. He was under the impression that the Locomotive and Motor Car Acts were not looked into as they should be. He believed that the dead weight per axle was often exceeded. If that were looked into they would get some relief. Mr. Priestley was now constructing a reservoir in his own county, and, of course, they would in the future get rates from it. At present there were no extraordinary traffic, but if they did get extraordinary traffic from this work he should not hesitate to bring a claim against Mr. Priestley. If they had to make such a claim he thought they would certainly win, because Mr. Jenkins won in a similar case at Neath.

Mr. D. M. Davies (Neath Rural) said he was particularly interested because he was one of the parties referred to in the Neath case. They constructed this reservoir outside the borough area, and their contractor was responsible for the damage done by the extraordinary traffic. He thought the damage was mainly caused by the excessive weights carried by the sub-contractor, and was due to no fault of the contractor. The contractor, he thought, made one mistake when he did not protect himself when he let the sub-contract. The reservoir was some 400 ft. or 500 ft. above the level of the town. The greater part of the road over which the loads were carried was within [illegible] district, and a very short length within the borough area. Their section of the road did not suffer to the same extent as the road in the borough, owing to the foundation of the road. They had some extraordinary instances of claims for extraordinary traffic—one for timber, one for stone, and one for the storage reservoir for the borough of Neath. They had no benefit of supply, but they had the benefit of the rateable value. They

considered they had a claim for the damage done. Mr. Jenkins had protected his corporation by a clause in the contract as to damage. They claimed £89 from the contractor, Mr. Allen, and he came forward and promptly paid it. He took it from that that he felt he had had value for his money. With regard to claims for timber haulage, their clerk had always advised them to settle if they possibly could with their adversary. There was no doubt the day was arriving when the roads must be made sufficiently strong to take all the traffic of the district. They had traffic now which they would not have dreamt of five years ago. They had engines with two trailers, each carrying a load of 6 or 7 tons, and that was what they would never have thought of in the past.

Mr. E. Whitwell (Abersychan) said the question of extraordinary traffic was one of the most neglected in the departments of a surveyor. Mr. Jenkins stated that with merely occasionally heavy traffic the road had time to recover itself in between. He could not imagine that a road which was damaged in a material sense could ever recover itself. No one who noticed a highway in which there were deep ruts ever saw those ruts disappear except by repair of the roadway. Mr. Jenkins might possibly enlighten them as to his meaning on that point. With regard to annual cost per mile of repairing the roads, Mr. Jenkins suggested (and probably gave them the practice in other similar cases) that the average to be taken should be a period of five years. That might be rather difficult if the road had not been recoated during the five years. There were cases in which roads lasted eight or ten years without recoating. Mr. Jenkins suggested that notice should be given to the party when the damage commenced. He agreed that directly any signs of damage became apparent an intimation should be sent to the person responsible. Mr. Jenkins also referred to the importance of keeping a road ledger. Was it possible to keep a road ledger which was sufficiently accurate as to costs, and, if so, in what form did he keep it? He had adopted a form for some years and found it very difficult. There were so many things—sweeping, cleansing, watering, and so on. Even in his district he had 70 or 80 miles of road, and it would take two clerks to keep an accurate account.

Mr. H. A. Clarke (Briton Ferry) said the attention of most surveyors was engaged now on this subject, and the information given in the paper was most valuable. Some years ago, during the construction of a railway through his district, the contractor carted over one of their roads considerable quantities of the material required for bridge construction, and did much damage. Traction engines were not then in vogue. When the question of the payment of the increased cost of repair and maintenance was brought to the contractor's notice, he did all he could to get out of it. Eventually a bargain was struck that the contractor should, at the completion of the haulage work, resurface the portions of the road required by the surveyor. The council at that time thought such procedure was better than taking the usual proceedings for recovery. Then a few years ago the council took over the maintenance of a canal towing path—length, approximately, 800 yds.—which averaged 12 ft. in width. The track had been abandoned as a towing path, and reformed with a fair foundation and metalling. At the time the ordinary traffic was light, consisting of horse-drawn vehicles, conveying coal, bricks, &c.; to a small industry, and small tradesmen's carts. Subsequently a new industry was started, with the result that upon this narrow road the traffic increased considerably in quantity and weight—loads ranging up to 5 tons in wagons having ordinary wheels. The traffic being in the same rut continuously, the sides, being weak, were squeezed out, making it necessary to construct concrete retaining walls to support the [illegible] deal, and the council endeavoured to prevail upon the proprietors of the new industry to contribute toward the increased cost. This they declined to do. They admitted that there was a considerable volume of traffic, but contended that it was not heavier or more destructive to the roads than the average traffic of the district, and did not agree that the case came within sec. 23 of the Highways and Locomotive (Amendment) Act, 1878. Probably his council showed some weakness there, for they decided not to take [illegible] might prejudice the development of the new industry. It might be a reasonable view to take that a charge should only be made for extraordinary traffic where the work was of a temporary nature; but where a new industry had developed the increased cost should be borne by the road authority, notwithstanding the fact that the road was unsuitable for such traffic.

Mr. Edwards observed that five years was the time given in the paper for averaging the cost per mile of road repairs. In his district, where there was extraordinary traffic, it was largely due to the development of the district. The cost of his roads had been about £40 per mile per year, but while the model village was being erected by the colliery company it would probably run up to £160 per mile. The question was whether the council would not be justified in looking upon the higher expense as due to the development of the district. The colliery company paid about one-fourth of the rates; the model village was being erected by the colliery company, and the whole of the haulage was done by traction engines carrying about 10 tons.

The Chairman, in closing the discussion, remarked that in Cardiff they had never made a claim of this kind, though there was a case going on now where they would be perfectly justified in making a claim. He intended putting the matter to his committee, and leaving it to them as to whether they should make a claim or no; but for forty years they had never made a claim for extraordinary traffic. Their extraordinary traffic had been in the carting of building material for the natural development of the city, and it had been over roads where there had been a great deal of other traffic, and it would be difficult to make claims for damage for any special haulage. There was a point in connection with roads which had not come under Mr. Jenkins' paper; it did not affect that aspect at all. It was a rather important one—that was the strength of the bridges upon the roads of the country. This question was raised some few years ago; he did not recollect exactly how it arose, but he thought it was on a paper discussed at one of their meetings. It raised the question what, in case of this country going to war, would happen with so many weak bridges which were only just capable of taking the ordinary cartload of stone or building material? They could imagine if they had had in this country what had happened in Belgium and a part of France; if the enemy came into this country and the War Department had to carry the munitions of war over the hundreds of bridges, how would they manage to do it without those bridges collapsing? At that time he thought it was suggested that the attention of the War Office should be called to the point. He was not sure whether it was or not, but at any rate nothing was done. It was of very great importance that they should consider the carrying capacity not only of the roads, but of the bridges, because, after all, the strength of the road was no good unless the bridges would carry the traffic. Since he had been in Cardiff they had reconstructed over fifty bridges—practically all the bridges which would not carry a motor or traction engine with its trailers. There was only one bridge which had not been so reconstructed. He put it to them to consider whether not only the roads, but the bridges should be made sufficiently strong to carry all the traffic.

The vote of thanks was carried.

Mr. Jenkins, in replying, said the object of the paper was not, of course, to encourage litigation. He quite agreed with what Mr. Phillips and Mr. Whitwell had said—that in all cases of extraordinary traffic it was far better to compromise than to go to litigation. It was a very thorny subject, and all sorts of points cropped up, and although the Courts had now laid down a clear issue, it was far better to settle when possible, even if the amount were less than they thought they were entitled to. Mr. Edwards raised a point as to extraordinary traffic arising from extraordinary development of the district. He would not advise his council to bring an action in a case of that kind. He thought it would be very doubtful if that would be extraordinary traffic. Mr. Phillips had referred to the difficulty, in some cases, of getting sufficient details of expenditure. He did not think the Courts were very exacting in that respect; they had to show that their cost in repairing the damage caused by the extraordinary traffic had been about so much. Mr. Priestley had asked whether a highway authority was justified in making a claim for extraordinary traffic in connection with works in their [illegible] tage from rating. That was a matter for the council to decide. Where there was going to be a big revenue from work it was a question whether a claim for

extraordinary traffic was worth pleading, but that did not affect the question of his right to plead. All Prosser also asked for the production of the [illegible] Limited. He would not say the exact amount, but it was a very substantial sum. It was to be attacked who had to pay, and there were circumstances which made it advisable to accept a reduced sum. The question of timber haulage had been referred to by one or two speakers. There was a popular impression that if any traffic was connected with established industries they could lay a claim to extraordinary traffic. That was quite a mistake. It all came back to this: What was the character of the road, and what was the ordinary traffic on it? In the case of timber haulage a man bought a certain amount of standing timber, and had to haul it away. That occurred every few years. He did bring on to that road traffic for which it had not been constructed and beyond the limits of ordinary traffic, and it had been held that a claim for extraordinary traffic lay. He might say that the damage spoken of in the paper was, to a great extent, due to the excessive weights brought upon the road by the sub-contractor; but the difficulty was that the sub-contractor appeared to have no responsibility at all. He knew that 7 tons were carried in these wagons until the sub-contractor said that if the traffic was continued it would make the road impassable for himself. Their road had a bottom of very soft clay, whereas there was a very much stronger bottom in the rural district. Moreover, their road had a very heavy gradient; that outside the borough was much less. They were bound to agree to make all roads to stand motor traction traffic; but it was going to be a long time before all rural roads had to stand heavy motor traffic, and it would be an extravagance to put in a strong foundation for it. It would be as unreasonable as to make their sewers and storm-water drains sufficiently large to carry the heaviest possible storm rainfall. It must be obvious that there were a large number of roads which could not be made so expensively as the main and arterial roads. With respect to Mr. Whitwell's point as to the recovery of roads they all knew that roads had a certain resiliency, and if there was no repetition of the extraordinary traffic the road practically recovered itself. As to the annual cost of a road per mile, the period of five years was taken for the practice of the Courts, and had been held to be a reasonable period to take. As to a road ledger, he admitted that they could not keep their road costs with absolute accuracy, but it was possible to keep the ledger within reasonable limits of accuracy.

THE ROYAL COMMISSION ON SEWAGE DISPOSAL.

AN APPRECIATION.

By John D. Watson, M.Inst.C.E.,
Engineer to the Birmingham, Tame, and Rea District Drainage Board

After more than sixteen years' investigation and deliberation the Royal Commission on Sewage Disposal have issued their Final Report. Very few Royal Commissions have laboured so long or done better public work, and it is to be regretted that only three of the original nine members (Lord Iddesleigh, Sir William Ramsay and Colonel Harding) remain to receive the gratitude of the public for their valuable services. That the commission have maintained an even course, notwithstanding the changes in its personnel, is very largely due to their able secretary, Mr. F. J. Willis, whose recent appointment to a seat on the commission was a graceful acknowledgment of his ability and indefatigable services to the community. The commission had its genesis in the clamour of sanitary experts for more enlightened and less stereotyped treatment of schemes of sewage disposal, and in their First Report, issued in 1901, the commission dealt with the chief question in dispute—viz., whether it was practicable to produce, by artificial processes alone, effluents which will not putrefy, which could be classed as good according to ordinary chemical standards, and which might be discharged into a stream without creating a nuisance. This they answered in the affirmative, and went on to express the opinion that the Local Government Board would be justified in modifying, under proper safeguards, the application of sewage to land.

Around this salient feature of the Interim Report an immense amount of valuable work has been done by the commission, work for which I have nothing but admiration; but critics have not been wanting who have said that the recommendations following upon it have been lacking in definiteness, that they have been inconsistent, and more likely to be a source of weakness than strength.

This criticism evinces lack of appreciation of the [illegible] and traces a narrow outlook on the part of the critic. Those who say that the Royal Commission after all those years of study should have been able to state clearly and definitely what is the best method of treating sewage do not realise that there are hardly two sewages alike, and that even in the same town the leading characteristics of the sewage sometimes change as the town develops. The very reasons which account for such a prolonged study of the subject as the commission have made during the past sixteen years may be adduced to prove the unwisdom of dogmatic assertion where the treatment of so changeable a substance as sewage is concerned. The commission have done what was most needed—they have obtained and made serviceable vast stores of information, they have recorded individual views, and they have expressed their own without equivocation in such a manner that the expert is encouraged to study specific cases in the light of the best modern scientific opinion and practice. To have attempted to set up a best method of treatment, as one would a best process of manufacture, would only have prolonged the thraldom so irksome to an engineer who wishes to stamp his work with some individuality—a thraldom which obtained to a great extent in the days when nothing but land treatment would satisfy the Local Government Board.

The history of the sewage question shows too clearly the

INFLUENCE OF ROYAL COMMISSION REPORTS

in their tendency to stereotype the methods and practice of great Government departments. We cannot forget that commission after commission have stated that land treatment was the only proper method of sewage disposal; nor have we forgotten the claims that were made on behalf of the Exeter septic tank process, and its extravagant claim to have solved the sludge problem, besides many other less-known claims that have been accepted and rejected in turn. But the Iddesleigh Commission have rid us of this bugbear. They have adopted the view that each purification scheme should be considered on its own merits, and that the nature of the stream or watercourse into which an effluent is to be discharged must be taken into account as well as the quality of the effluent. This, in my judgment, is a sound attitude to adopt towards a subject which unites indissolubly applied science with progressive scientific knowledge.

Their Third Report indicated that the commission

were satisfied that the law required to be altered in several particulars, and that a central authority be established possessed of adequate technical knowledge and statutory power to determine differences without being obliged to have recourse to the Law Courts.

The proposed drastic change has been received with a good deal of sympathy, as the impossibility of adopting a law which would be applicable to all cases of sewage purification is almost universally recognised. As the law stands local authorities are bound to see that sewage is treated in such a manner that it is freed from all excrementitious, foul or noxious matter such as would affect or deteriorate the purity or quality of the water into which it is discharged—a duty which may be tantamount to requiring the local authority to do the impossible. If sewage works for which the local authority is responsible are located on a pure stream, the cost of providing works to comply with the law would be ruinously expensive, and if the effluent were not greater in volume than 1/2000th part of the river into which it is discharged—as in the celebrated Llanrwst case—the absurdity of enforcing the law would be apparent to all but the most biassed. When, however, one comes to consider the need for setting up Rivers Boards, the wisdom of the recommendations of the commission is not so apparent, as there are several notable instances of existing county rivers authorities having done good work at comparatively little expense, and I am glad to see that this view appears to be recognised in the Ninth Report. Whether a river authority does good work or not is probably more a matter of individual initiative than administrative machinery.

The Eighth Report contains a recommendation which has caused a good deal of discussion, and which in the opinion of some is the crux of the sewage disposal question—viz., the setting up of a standard for effluents. This recommendation was regarded by the Association of Municipal Corporations as of sufficient importance to warrant them in inviting experts to consider the question in all its bearings. This Expert Committee, after several meetings for discussion (at one of which the officers of the Royal Commission were good enough to enter into an informal conference with the members), reported to the Association of Municipal Corporations that it is not desirable that

STANDARDS OF PURITY

should be prescribed by Parliament.

A standard fixed by Act of Parliament would do far more harm than good. Nature varies her requirements in the different seasons of the year, and the sound principle admitted by the commission that the quality of an effluent should have a definite relation to the quality of stream into which it is discharged should be emphasised. A statutory standard would strangle that principle.

Our legislators should aim at the conservation of pure, and the improvement of polluted streams, but they should never forget that a manufacturer has the right to a reasonable use of a stream passing through his property no less than the sportsman and angler. Adherence to a uniform standard for sewage effluents would frequently inflict unnecessary hardship upon local authorities and individuals, as it would be unreasonable to expect even the most up-to-date sewage plant to give as good effluents in winter as in summer, or as good effluents during the day as during the night, when the normal strength of the sewage is greatly reduced. No doubt the capacity of the plant could be materially increased so as to obtain more equal effluents than the best works produce at the present time, but the cost would be great and the gain in most cases would be inappreciable. The responsibility attached to a local authority is sufficiently great without imposing irksome duties the benefits from which would be altogether disproportionate to the labour and expense involved. The Iddesleigh Commission are entitled to respect for having adhered to their original purpose to have regard to economy in their recommendations.

If the central authority when appointed is able to furnish local authorities and their engineers with specific indications of the quality of effluents which they are prepared to accept in specific cases, a great public service will be rendered; but to do this it is essential that that authority must have a free hand to deal with individual cases without being hampered with one, or even several, typical standards specified by Act of Parliament.

However reluctant I am to advocate the multiplication of Government Departments, I am convinced that the Royal Commission are justified in suggesting that an ordinary law court is not a suitable tribunal to deal with river pollution cases, and that a central authority is much more likely to deal out even-handed justice than the court whose function is merely to administrate the law. The greatest care should, of course, be taken to see that it is not possible for one authority to order works which would not be accepted by another authority. The Local Government Board now have the power to refuse borrowing powers for the construction of new works, and when such powers are granted there must be conformity to certain requirements of the board, and care should be taken to see that these requirements do not clash with the requirements of the proposed central authority. If so it will eventually it may be necessary that the central authority should in some way be affiliated to the Local Government Board, but it will be necessary to bear in mind that Parliament is under no obligation to accept the lead of a Government Department when asked to approve of a Bill to authorise the construction of public works. It would be anomalous for either Parliament or the Local Government Board to approve of sewage purification works capable of producing an effluent which would comply with a much higher standard than the central authority deem necessary.

THE NINTH REPORT

is not at all likely to give universal satisfaction. It is sure to meet with opposition from certain quarters and certain manufacturing districts; but, taking it as a whole, it seems to meet the difficulties fairly well, although I still adhere to the view, however reluctantly, that the only way out of so many obvious difficulties is for the central authority to take full responsibility for deciding what is essential in individual cases.

The difficulties surrounding the question of standards for effluents from purification works dealing with ordinary town sewage are great, and they are not diminished when trades waste has to be dealt with. It appears to me that manufacturers will have to trust to the integrity of the central authority, just as the local authorities have learned to trust the integrity of the Local Government Board.

The commission has been so long in existence that its end will not be unwelcome to some, but it will also be regretted in many quarters where its help was as freely given as it was much needed. Distillers on the Scottish rivers, owners of oyster beds, and residents on Belfast Lough, and municipalities all over the kingdom will look in vain for the repetition of that unbiassed scientific advice which the commission have been able to give through their exceptionally able staff, unless, indeed, the central authority when created is actuated by a similar spirit.

No one who understands anything of the subject of sewage purification can honestly say that the problem has been solved. Much has been done during the past generation to bring us nearer a satisfactory solution, but much still requires to be done, and a great advance will be made if when the central authority is established it is provided with sufficient funds to set up as part of its working machinery a research laboratory on the lines of the research department which the Massachusetts State Board of Health has had for so long.

Royal Institute of British Architects.—At a meeting to be held on Monday, April 19th, Mr. Segar Owen (Fellow) will read a paper on "The Design and Construction of Buildings for Industrial Purposes."

Quarry Bank Surveyor and the Mud Cart.—Mr. Furber, Quarry Bank's surveyor, says the *Brierley Hill Herald*, does not look like having a mud cart and brush just yet. He has worked hard to get the sanction of the council for its purchase, but now that he has succeeded in getting the members to his way of thinking he finds that there is no money to spare for the luxury. Mr. Furber has to suffer adverse comments upon the condition of the roads of the township, and few people seem to realise how helpless he is in the matter. Bricks cannot be made without straw, and roads also cannot be kept in good repair without money being spent upon them. Quarry Bank is probably the only district in the country where a mud cart and brush would be looked upon as a luxury. Every other town consider them necessary possessions.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C.E.

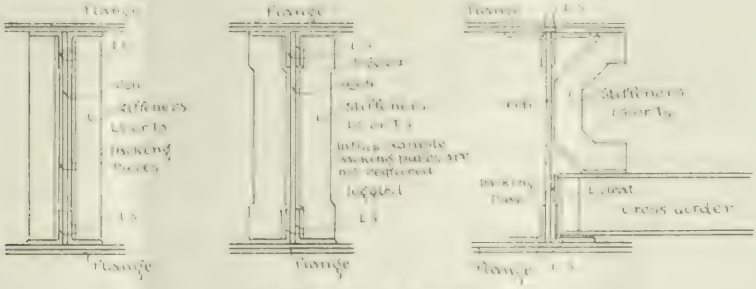
All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24, Bridelane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

466. Road Making.—Describe a test that will enable an engineer to ascertain the quantity of the bitumen and filler to be used in a bituminous macadam road. (L. . . .)

469. Sewage Sprinklers.—Give a good practical method of marking off the holes in the [illegible] to the question which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.



SOME EXAMPLES OF STIFFENERS.

[illegible] arms of revolving sprinklers. The diameter of holes to be constant. (C. A. B., *Catford.*)

471. Building Construction.—[illegible] Explain its function and give sketches to illustrate. (M. T. R., *Rhyl.*)

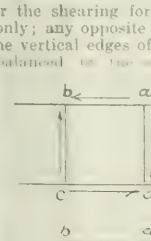
472. Statics.—Discuss the relative advantages of the graphical and analytical methods in the determination of the stresses in a framed structure. (M. T. R., *Rhyl.*)

REPLIES TO QUESTIONS.

468. Girder Design.—Explain a method for determining the position of the web stiffeners in a plate girder. (J. F., *Padiham.*)

The following alternative reply to this question has been received since our last issue.

In the web of a girder the shearing force does not act in one direction only; any opposite tangential stress acting along the vertical edges of a rectangular plate must be balanced by the moment of a pair of tangential stresses acting along the horizontal edges, and these forces, in all cases, will be proportional to the respective sides of the rectangle. The horizontal shearing force acting along *ab* will be to the vertical shearing force acting along *ad*, as the side *ab* is to the side *ad*. This necessary equilibrium applies also to every portion of the plate. If the panel *abcd* be divided into any number of square or rectangular compartments, as sketch, each individual rectangle will be subjected on every side to a shearing force proportional to the length of that side. The straining effect produced upon the rectangular plate *abcd* by these opposite shearing forces is a tendency to distort its rectangles to parallelograms, as *abcd*, the sides of the rectangle being unaltered in length, but the angles altered, as in the case of a bolted joint subjected to shearing strain. The diagonal *ac* will be extended and the diagonal *bd* will be extended; the shearing stress will produce no extension or compression of the horizontal or the vertical fibres, but all fibres sloping in the direction of *ac* will be shortened, and all fibres sloping in the contrary direction will be stretched. The resistance



which a solid body offers to such a distorting strain is really due to the direct resistance of its particles to tensile and compressive strains in diagonal directions, and the special function of the web in transforming vertical forces into horizontal stresses can as well be performed by a series of diagonal bars uniting the two flanges and crossing each other, and in such a case each bar would have to exert merely a direct tensile or a direct compressive stress. The web is assumed to have the shear uniformly distributed over it; therefore the minimum area of the web should be such as to keep the shear stress within safe limits.

D = depth of web in inches
t = thickness of web in inches
f_s = the safe shear stress
S = the shearing force at the given point

$$t \times D \times f_s = S$$

$$t = \frac{S}{f_s D}$$

The thickness of the web may require to be increased at the ends beyond that necessary for shear stress to provide sufficient bearing area to give a reasonable pitch to the rivets. As previously shown, the shear stress causes tensile and compressive stresses at right angles to each other, and at 45 deg. to the direction of the shear stress; therefore the web buckles, due to the compressive component of the shear stress. To make allowance for this it was first proposed to treat the web as a strut equal in length to the diagonal of the panel, with diameter equal to the thickness of the web, and work on Gordon's formula. Mr. Theo. Cooper, of New York, suggested a similar formula with different constants, the distance between the stiffeners being taken instead of the length of the diagonal. Cooper's formula for the shear stress to adopt in plate girder webs is:—

$$\frac{\text{shear in tons}}{\text{area of web in sq. in.}} = \frac{5}{1 + \frac{d^2}{1500 t^2}} = f_s$$

where d = distance apart of stiffeners in inches
where t = thickness of web in inches

From this we get the theoretical spacing of stiffeners, if the thickness t is fixed

$$d = 38.5 \sqrt{\left(\frac{f_s}{5} - 1\right)}$$

$$\therefore \frac{d^2}{1500\,t^2} = \frac{5}{f_s} - 1$$

$$\therefore d^2 = 1500\,t^2\left(\frac{5}{f_s} - 1\right)$$

$$\therefore d = 38{\cdot}7\,t\sqrt{\left(\frac{5}{f_s} - 1\right)}$$

(E. W. P., *Southampton.*)

470. Structures.—What are "deficient" and "redundant" frames respectively? Give some outline diagrams as illustrations. (T. R.)

A theoretical framed structure is built up of a number of straight bars "pin-jointed" at their extremities, and when the centre lines of the bars are all in the same plane it is termed a plane frame. A framed structure is designed, as far as possible, so that the members have only pure tension or compression stresses, bending stresses being obviated. Joints may be either "riveted" or "pin-joints." In calculating the stresses in the members of a framed structure it is always assumed that the joints are "pinned."

(1) A framed structure may be deficient or under-firm.
(2) ,, ,, ,, perfect or firm.
(3) ,, ,, ,, redundant or over-firm.

(1) A deficient or under-firm frame has an insufficient number of bars to keep it in equilibrium for all systems of loading.

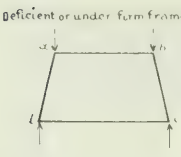


Fig. 1.

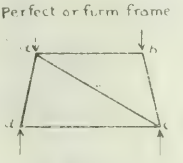

Fig. 2.

Fig. 1.—For certain values of the forces acting on it, this frame would be in equilibrium, but it would collapse if the forces were changed.

(2) A perfect or firm frame has a sufficient number of bars, and no more to keep it in equilibrium for all systems of loading.

(3) A redundant or over-firm frame has a more than sufficient number of bars to keep it in equilibrium for all systems of loading.

A deficient or under-firm frame with actually "pin-joints" is in unstable equilibrium, and if the joints be riveted its stability will depend on the stiffness of the joints, the members being then subjected to bending stresses which it is the object of the framework to avoid.

In a redundant or over-firm frame any stress in a member caused by bad fitting or change of temperature will cause stresses in all the other mem-

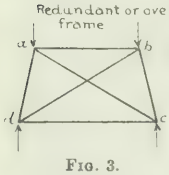

Fig. 3.

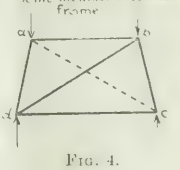

Fig. 4.

bers, which it is impossible to calculate by simple mathematical or graphical process. These frames are consequently termed "statically indeterminate."

(4) Semi-member or Counterbraced Frames.—Certain frames having the appearance of "redundant" frames act as "perfect" frames, and may be treated as such.

Fig. 4.—The two diagonal bars *ac bd* each can act in "tension" only, so that if the loading tends to put one of the diagonal bars *ac* in "compression," it would go out of action, and the frame would act as if *bd* were the only diagonal.

The diagonals *ac bd* are semi-members, or counterbraces, and are commonly used, especially in the centre panels of railway bridge trusses in which the crossing of the load causes a reversal of the stress in the diagonals.

Fig. 2.—In a perfect or firm frame the bar *dc* has two joints; two more bars, *ad ac*, are required to produce the next joint *a*, and so on to complete the frame.

∴ If N = number of joints in the frame, two of these will be required for the first bar, and the remaining joints, N−2, will require 2(N−2) bars.

∴ The total number of bars = 2(N−2)+1 = 2N−3.

∴ In a perfect or firm frame the number of bars is equal to twice the number of joints minus 3.

In cases where the number of bars is more than this the frame is "redundant," and where less it is "deficient." (E. W. P., *Southampton.*)

A frame is a structure composed of bars, rods, links or chords united at their extremities by joints which offer little or no resistance to rotation of the frame. The function of a structure is to transmit force. When determining the stresses in the different members of a structure of this type by the application of the principles of statics, we regard all joints as hinged, although they may be riveted in the actual structure under consideration. Any stiffness or rigidity that a frame may possess in virtue of its joints being riveted is neglected for purposes of design. Frames may conveniently be divided into three classes—viz.:—

(1) Perfect frames, which have just sufficient struts and ties, and no more, to preserve the shape of the frame under load.

(2) Deficient frames, which have not enough ties and struts to prevent the distortion or rotation of the frame under load.

(3) Redundant frames, which have a larger number of members than required to resist change of shape under load.

The stresses in frames of class No. 1 can be determined by the application of the principles of statics, while those in frames of class No. 3 cannot be determined by these means alone, but require also the use of the "principle of least work" for their solution. The definition of this principle is as follows: "The true stresses in a redundant elastic system in stable equilibrium are such that the internal work stored therein is a minimum.

To apply the above in the solution of a problem of this nature involves the use of Hooke's Law of Elasticity, and presumes a knowledge of the sectional areas of all members of the frame. The problem of the design of a redundant system appears, therefore, to be an indeterminate one. This is the principal reason why redundant systems are not regarded so favourably as formerly, and this is specially true with respect to the employment of such systems in structures of large dimensions. However, redundant systems perform their function economically when loads carried are comparatively light, and when stiffness is a consideration—for instance, lattice girders with multiple web systems, as used for foot bridges, and light girders of the double Warren type, as used to carry small rolling crane loads. (M. T. R., *Blyth.*)

Glasgow Town Planning Scheme.—The corporation of Glasgow have applied to the Local Government Board for Scotland for authority to prepare a town planning scheme with reference to lands at Kennyhill and Riddrie. Besides the corporation there is only one other proprietor of ground within the area included in the scheme, and, so far as known, he is not opposed to it.

"Tarvia." As was recently pointed out by the War Office, the manufacture of high explosives is dependent on the supply of certain by-products obtained from the distillation of coal tar, and the authorities have made a special request that under the present circumstances nothing but dehydrated or refined tar shall be used for road improvement. A circular which Messrs. Bristowe & Co., Limited, 11 Tothill-street, Westminster, are issuing to their customers, states that "Tarvia" complies in every respect with this requirement, all the elements from which high explosives are prepared having always been carefully removed in the manufacture of their material. "This process," it is added, "ensures the reliability of 'Tarvia,' owing to these products which are not only useless, but absolutely detrimental to road making and treatment, being entirely eliminated. By using Tarvia you not only assist assisting the Government, but ensuring good results."

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Armagh T.C. (March 31st. Mr. P. C. Cowan).—£1,300 for the purpose of [illegible] the supply of water to the district within the town. Mr. [illegible] Kennedy, stated that during the past [illegible] had been twice subjected to great shortage of water owing to insufficient storage capacity in the reservoir at Lavey's Lake. It was proposed to raise the weir by 2 ft. to remedy this defect, and it is necessary to acquire additional land, hence the application for this loan.

Burnley T.C. (March 24th. Mr. F. O. Stanford).—£23,030 for the extension of the Altham sewage disposal works.—The borough surveyor, Mr. G. H. Pickles, giving evidence, dealt with the proposed extension of the works and [illegible] The [illegible] present [illegible] meeting the increases generally in tenders.

Leyton U.D.C. (March 19th. Mr. M. K. North).—£460 for the purchase of land for the widening of Church-road, Leyton, and £1,650 for the construction of underground public conveniences at the junction of Church-road and Lea Bridge-road.—There was some opposition to the road widening scheme on the ground, as alleged, that it was proposed for the wrong side of the road. No opposition was offered to the proposed underground convenience.

Pontefract T.C. (March 31st. Mr. P. M. Cross-[illegible]) £21,000 for [illegible] disposal.—It was stated that in 1902 the corporation spent £14,000 on the present works in the hope of dealing finally with the sewage; but three years ago complaint was made by the West Riding Rivers Board with respect to the effluent running into the Aire, and eventually the board took proceedings in the county court. An order of abatement was made by consent, and the present scheme, prepared by Messrs. D. Balfour & Son, of Newcastle-on-Tyne, was the sequel. Dr. Wilson, who represented the Rivers Board, said he had no criticisms to offer. The scheme would be very easy to work, most economical, and [illegible] some years. In answer to Mr. G. W. Hobman, who represented the Pontefract Rural District Council, Mr. Balfour said that every precaution had been taken to safeguard the main road and the adjoining property from any nuisance. The inspector suggested that the Treasury might object to granting a loan at the present time, whereupon the town clerk said with an expenditure of about £200 the present works might be utilised for another year, and Dr. Wilson said the Rivers Board would not take any steps if the Treasury raised objection.

Sheffield T.C. (March 31st. Mr. H. Shelford Bidwell).—£164,373 for extension of electricity supply works and plant.—The object of the extension, it was stated, was that the corporation might be in a position to supply much-needed assistance to the large armament works which were now engaged at top pressure on Government orders.

Upper Stour Valley Main Sewerage Board (March 31st. Mr. M. K. North).—£1,500 for sewerage purposes. The engineer (Mr. W. Feltham) stated that the length of sewer affected extended from New-street, Quarry Bank, to Cradley Pool, and from Butcher's-lane, Cradley, to New-street, Cradley. It was in all about a mile in length. The sewers were constructed in 1896, but, owing to mining operations, they commenced to subside as far back as 1900, and several lengths had been replaced on various occasions, the cost to the board being about £200 to £400 per annum, which had been paid out of the revenue account. The inspector alluded to the fact that the Local Government Board was opposed somewhat to the raising of loans at the present time, and inquired whether, in the event of sanction being deferred for one year, it would endanger the public health or seriously pollute the river Stour. The engineer replied that such a proposal would not imperil the public health, and he did not think it would seriously affect the river, which had been for some time past a receptacle for a good deal of manufacturing waste. It was desirable, nevertheless, that the work should be proceeded with.

APPLICATIONS FOR LOANS.

Ellesmere Port U.D.C. £5,500 for new municipal offices, and £2,450 for road widening.

Frome U.D.C. £320 for sewer extension.

Leyton U.D.C.—£17,158 for electricity plant.

LOANS SANCTIONED.

Celbridge No. 2 R.D.C.—£4,930 for the provision of cottages.

Foleshill R.D.C.—£14,250 for housing schemes at Foleshill and Bedworth.

Heywood T.C.—£6,440 for the purposes of the electricity undertaking.

Melford R.D.C.—£750 for the erection of houses.

FORTHCOMING INQUIRIES.

APRIL. £

13. **Blackburn.** For the erection of public [illegible] (Mr. Edward Leonard) 9,000

13. **Clacton.** For works of sewerage and [illegible] (Mr. P. M. Crosthwaite) 10,150

EURIPIDES

INSECTS AND DISEASE.

To the Editor of THE SURVEYOR.

SIR,—In view of the approach of warmer weather, it may be well to draw attention to the fact that much of the clothing of the wounded arriving at Red Cross hospitals is, as one would expect, swarming with lice, and probably many sanitary inspectors have the task of disinfecting the clothes by heat. At present, so far as one hears, there is no typhus in France or Belgium. The war commenced towards the end of the hot weather last year, and the trenches were comparatively clean when the cold weather set in; but the lice are now arriving when insect life will be exceedingly active—one hopes without a corresponding increase of disease.

Lice (so-called) almost certainly are known to convey typhus. Verb. sap. The work of sorting out, brushing and labelling the clothes of the wounded when they arrive at the hospital usually devolves on the quartermaster, while the lot of disinfection belongs to the local sanitary inspector, and it seems only fair to point out that lice should be regarded as conveyers of infection, and that the clothes should therefore be handled carefully.

One may wait in vain for any official dictum on such a point; spoon-feeding and optimistic euphemisms appear to rule the day. It is not so many years ago since certain bacilli found in this country, and identified as plague bacilli, were referred to officially under a long new Latin name to allay public apprehension.

How many lives lost by enteric at the commencement of the Boer War would have been saved if the persons responsible had notified those who were inoculated against enteric that for the first six weeks after inoculation they would be rather more susceptible than normal to enteric?—Yours, &c.,

G. BERTRAM KERSHAW, M.INST.C.E.

9 Victoria-street, S.W.
April 7, 1915.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Cornwall; housing and town planning—Evesham, Ludlow; roads and materials—Barrow-on-Soar, Croydon; sewerage and sewage disposal—Aberdeen, Chertsey; water, gas and electricity—Aberdeen. Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Blairgowrie T.C. — The question of effecting improvements at the public hall is under consideration.

Blyth R.D.C.—A scheme has been approved for additions to the isolation hospital, at an estimated cost of £400.

Bridgwater R.D.C.—The Watchet and Langport Rural District Council are to be approached by this council on the question of the provision of a joint isolation hospital.

Eastbourne T.C. The council have forwarded to the Board of Trade an application for sanction to construct two timber groynes 220 ft. long upon the foreshore below high-water mark, 600 and 900 ft. respectively, south-west of the shelter in the Holywell Pleasure Ground.

Cornwall C.C. —Dr. Clarke, medical officer of health, in a report presented to the Sanitary Committee, proposes that the county council should become the authority for the treatment of infectious diseases by the provision of two hospitals of twelve beds each, at an estimated cost of £2,500. A committee has been appointed to go into the matter.

Leeds T.C.—The corporation have approved the purchase of a site at Hunslet for the erection of a transformer substation.

Lewisham B.C.—The borough council are recommended by the Health Committee to build a tuberculosis hospital.

Leyton U.D.C.—A scheme has been sanctioned for the erection of a temporary fire station in Church road at an estimated cost of £500.

Rowley Regis U.D.C.—It has been decided to build a retaining wall for about 70 yds. in Powke-lane where landslides occurred recently, at an estimated cost of £130.

Tredegar U.D.C.—The report of the surveyor, Mr. W. L. Roach, suggesting the erection of a lavatory and waiting-room at Bedwellty Houses, and alterations to the council chamber, at an estimated cost of £150 has been adopted.

HOUSING AND TOWN PLANNING.

Evesham T.C.—The council have purchased sufficient land to build 150 houses, and a proposition was made last week to ask the Local Government Board for sanction to borrow £11,275 for the erection of fifty-two houses, as a commencement of the scheme. After discussing the matter, however, the council decided to adjourn further consideration of the question till August.

Ludlow T.C.—The Local Government Board have intimated that they would be prepared to sanction a loan for the council's housing scheme, but that for the present the construction of the houses must be postponed.

Newcastle-upon-Tyne T.C.—A tender at £6,828 has been accepted for the erection of workmen's houses in City-road.

Ruislip-Northwood U.D.C. — The council have approved the plans of Messrs. A. & J. Soutar for a housing scheme, and authority is to be sought for the purchase of land and the erection of twenty-two houses.

Woolwich B.C.—The council have accepted from the Office of Works a complete series of the plans of the new garden city at Well Hall for exhibition in the town hall.

PARKS AND OPEN SPACES.

Fleetwood U.D.C.—The surveyor, Mr. E. Frobisher, has been instructed to prepare an estimate of the cost of completing the improvements at the park, including the erection of two shelters and other works.

ROADS AND MATERIALS.

Barrow-on-Soar R.D.C.—It has been resolved to proceed with the making up of Anstey Old Green-lane-road, at an estimated cost of £2,928.

Belfast T.C.—The borough surveyor, Mr. H. A. Cutler, has received authority to proceed with the widening of Shankill-road at Glenwood, where property has recently been acquired under the Belfast Improvement Act, 1911, as soon as the necessary formalities have been completed.

Cambs C.C.—The following tenders for steam rolling have been accepted: Pamplin Brothers, Cherry-hinton, time only, £1 1s. per day; time and distance combined, 1s. 6d. per mile plus 10s. per day; S. E. Covill, Ely (two rollers only), time only, £1 2s. per day; time and distance combined, 1s. 6d. per mile plus 10s. per day.

Chiswick U.D.C. An intimation has been received from the Road Board that they were prepared to make a grant towards the resurfacing of Wellesley-road and Bath road, but suggesting that, if possible, the works should be deferred for the time being. It was stated that the work at Bath-road must proceed, as the contract had been signed. With respect to Wellesley-road, which was being used by the War Office, the surveyor, Mr. E. Willis, said it would be possible to do some temporary repairs in sections.

Cirencester U.D.C.—The Local Government Board having intimated that they would be unwilling to sanction at the present time the loan asked for by the council of £1,000 odd for the purpose of carrying out Bishop's Corner improvement in the Market-place, the council have resolved that the clerk write to the board explaining that the matter was taken in hand a considerable period before the war broke out, and that unless it was now carried through no other opportunity of effecting this great public improvement might recur for many years.

Croydon T.C.—An intimation has been received that the Road Board have sanctioned a grant of £18,950 for the proposed relief road from Thornton Heath to Purley.

Dumfriesshire C.C.—An improvement has begun on the section of the Carlisle and Edinburgh road of which the Langholm District Committee has charge. The road forms part of the main road from London to Edinburgh, and it is expected that the sum of £1,015 will be expended on it this year from the Development and Road Improvement Fund. Large sums will have to be spent in future years, as the scheme will take some time to complete.

Forfar C.C.—The Dundee District Committee have adopted the proposal of the surveyor, Mr. J. B. Roberton, to continue the work of laying a strip of pavement on the footpaths in populous places, and 3,500 lin. yds. would be laid, the same quantity as last year. The cost of pavement would be 4d. per superficial foot more than last year. Experience had shown that the strip of pavement was much appreciated by that section of the ratepayers who used footpaths only. The pavement would probably last twenty years, and always provided a clean place for walking on.

Glamorgan C.C.—At a meeting of the Roads and Bridges Committee letters were read from the Local Government Board and from the Road Board requesting the council to defer, where possible, schemes for the improvement and construction of roads and bridges, stating that no new grant could be made in respect of such works for the present. It was agreed to defer the carrying out of a great number of improvements on hand.

Grimsby T.C. The corporation of Grimsby have received from the Local Government Board a communication stating that at the present juncture they are unable to give sanction for a loan of £1,140 for

paving with granite portions of East Marsh street and East Robinson street, which are at present paved with water-bound macadam.

Hawarden R.D.C. The surveyor, Mr. W. Newton, reported recently that the new streets at Shotton had been completed at a cost of £719, leaving a balance of £46 in hand from the money received for the work. He proposed to tar-spray the streets, and treat them with a coating of chippings, and this and other necessary works would exhaust the whole of the balance. The surveyor was congratulated upon the economy of his methods.

Hursley R.D.C. It is reported that the Road Board have sanctioned a grant of £3,555 for the repair of roads damaged by military traffic.

Manchester T.C.—The council on Wednesday last agreed to the expenditure of £39,700 on the purchase of property in Cross street for improvement purposes.

Rawmarsh U.D.C. It was reported that the county council had acceded to the urban council's application for a grant of £80 towards the cost of the High street improvement. The estimated cost of the scheme is £2,537.

Reigate T.C. It has been agreed to lay wood paving on the approach to Redhill's bridge and Station road, Redhill.

Rugeley U.D.C. The question of widening Hagley road at an estimated cost of between £600 and £800 to meet the increased traffic due to the military camp has been referred to the Highways Committee.

Torrington R.D.C. It was stated at the council meeting on Saturday that in some parts of the district the stone used for road repair was not good enough. Colonel Moore-Stevens observed that it would not stand the lorry traffic. The only thing to do was to get stone which was more serviceable and for which, save money by it. The surveyor, Mr. T. B. Fairchild, said granite was not to be obtainable.

Tredegar U.D.C. An expenditure of £600 has been approved for works of road widening and fencing.

Trowbridge U.D.C.—The surveyor, Mr. H. Lailey, reported recently that he had been unable to get broken stone from anywhere. He had tried three or four places with the idea of procuring it before March 31st, and he had rented a small piece of land with the intention of stacking it until he could get it ready for the roads. It was the same everywhere, and the county council had had to appeal to the War Office to use compulsion because some of their roads were so bad. The chairman said it would be rather remarkable if they could get deliveries as usual in these times. He, however, quite saw the surveyor's difficulty. They might lose the county council grant, or a portion of it. Mr. Waight: Do I understand the difficulty is in getting stone, or stone already prepared? The surveyor: Broken stone from the quarries. There is such a demand for it. Trucks to convey it in are another big item.

SEWERAGE AND SEWAGE DISPOSAL.

Aberdeen T.C.—A sub-committee of the Sewerage Committee has been appointed to confer with the Public Health Committee on the subject of the drainage of the Mannofield district.

Chertsey R.D.C.—The council have approved the plans prepared by the surveyor, Mr. F. W. Greig, for the extension of the Bylleet and Pyrford pumping station, at an estimated cost of £1,947.

Kidderminster T.C.—The Health Committee have been asked to report upon a scheme of sanitation for Foley Park, one of the areas added recently to the borough.

Holmfirth U.D.C. The surveyor, Mr. G. Bray, has been instructed to proceed with the work of constructing a branch sewer in Kirkroyds-lane, and also a coke-breeze filter bed in the council's waste ground adjoining the lane for the treatment of the sewage.

Newry No. 1 R.D.C.—Messrs. P. H. McCarthy, Dublin, and S. Wilson, Newry, have been appointed joint engineers of the new sewerage scheme at a fee of 5 per cent on the cost of the work.

Prestatyn U.D.C.—The council have under consideration plans, sections, and estimates of the main sewerage scheme prepared by the engineer, Mr. Blizard.

WATER, GAS, AND ELECTRICITY.

Aberdeen C.C.—A special committee has been appointed consisting of the chairman of the eight districts of the council, with instructions to confer with the Aberdeen District Committee in the matter of the City of Aberdeen improved Dee water supply scheme. It was explained that it was particularly necessary to consider any question of damage to the roads, because very large contracts were to be carried out, and the council would have to try to endeavour to make some arrangement with the corporation of Aberdeen by means of which any damage should be made good.

Birkenhead T.C.—An undertaking having been given to limit the proposed expenditure during the year under the Corporation Water Act, 1907, to £160,000, it is expected that the necessary sanction to the expenditure of such an amount will be given by the Treasury.

Dundee T.C.—It has been decided to continue the 10s. minimum charge for the use of hose-pipes for garden purposes.

Holywell R.D.C.—With regard to the scheme of water supply for the parish of Llanaser, the clerk stated that the Local Government Board would never give their sanction to borrow the necessary £15,000 at present. The council decided that the scheme should be left over till a more opportune time.

Kirkcaldy C.C.—In connection with the new waterworks, the Kirkcaldy District Committee have decided to grant the contractors, Messrs. Jackson & Anderson, 2d. extra per hour for the men employed provided the number is not under 80, 2½d. per hour provided the number is not under 100, and 3d. per hour provided the number is not under 150.

Liverpool T.C.—The council on Wednesday last adopted the recommendation of the Water Committee for the promotion of a Parliamentary Bill to enable a further instalment of water to be conveyed from Lake Vyrnwy by means of a third pipe line.

Llandudno U.D.C.—In view of the refusal of the Local Government Board to sanction a loan for £2,000 for a necessary increase in the generating plant at the electricity works, the council have decided to pay for the new plant out of reserve fund.

Ludlow R.D.C.—A communication has been received from the Local Government Board stating that they would be prepared to sanction a loan for the Craven Arms water supply, but advising that the completion of the scheme should be deferred.

Midlothian C.C.—Negotiations are in progress for establishing a joint scheme of water supply for Cockpen and Bathgate.

Sandgate U.D.C.—The council have adopted the estimates of the surveyor, Mr. D. V. Howard, at £1,200, for the completion of the waterworks scheme, and the Local Government Board are to be asked to sanction a loan for the work.

Southam R.D.C.—Messrs. Taylor & Wallin, New Queen-square, Westminster, are the engineers of a water supply scheme, the cost of which is estimated at £4,500.

Torquay T.C.—In view of the attitude of the Local Government Board towards a proposed loan of £1,800 for alterations to the electricity generating station and the acquisition of new offices and stores on Victoria-parade, the council have authorised the town clerk to make such financial and other arrangements as might be required to meet the case, in the hope that the application for sanction would be considered at a future date.

MISCELLANEOUS.

Bedale R.D.C.—The surveyor, Mr. T. W. Metcalfe, reported that he had found it necessary to employ 115 additional men at a total cost of close upon £50 in wages for clearing the snow after the recent storm. The snow was so deep in places that the snow plough could not get through.

Colne T.C.—The borough surveyor, Mr. T. H. Hartley, has received instructions to prepare a scheme of cemetery extension.

The Assessment of Dundee Sewers.—Dundee Town Council met recently, when a report was submitted by the town clerk on the proposals to value sewers for income-tax. He said the annual valuation of sewers in Dundee was £8,000, and that on the new 2s. 6d. rate would mean that the ratepayers would in this form have to pay £1,000 a year in income-tax. He expressed the opinion that the subject was not a proper one for income-tax, and that in regard to the matter assessors were not acting with uniformity. It was decided to take any steps necessary to safeguard the council's interests.

PERSONAL.

Mr. W. Fowlds, borough engineer and surveyor of Keighley, has received an increase of salary.

Mr. F. Howarth, collector to the Altrincham Urban District Council, is with the Army Service Corps.

Mr. G. Lapwood, highway surveyor to the Romford Rural District Council, has been voted an increase of salary.

Mr. Herbert C. Jeffs, clerk to the Altrincham surveyor and medical officer of health, is serving with the Army Service Corps.

Mr. B. Richardson, assistant surveyor to the Sunderland Rural District Council, has had his salary increased by £25 a year.

Mr. Frank A. Williams, A.R.S.I., sanitary inspector to the Altrincham Urban District Council, has joined the Army Service Corps, and is now in France.

Mr. David Galloway, borough engineer and inspector of Inverkeithing, who joined the Royal Naval Division, has been appointed Lieutenant.

Mr. K. J. Foster, assistant surveyor at Chelmsford, has been appointed highway surveyor to the St. Germans Rural District Council, at a salary of £120 a year.

Mr. C. Benyon, highway surveyor to the Cheltenham Rural District Council, has been appointed to a similar position under the Abingdon Rural District Council.

Mr. C. G. Atkinson, P.A.S.I., assistant surveyor to the Wellingborough Urban District Council, has been appointed temporary surveyor to the Cheltenham Rural District Council.

Mr. L. Holme Lewis, engineer and manager of the hydraulic power department, was on Wednesday last appointed engineer to the Manchester Corporation waterworks department, at a salary of £850 a year.

Mr. George Jones, surveyor to the Llanfrechfa Upper Urban District Council died recently, we regret to state, and the council have passed a vote of condolence with the widow. He had served the council, it was stated, faithfully and zealously for nearly fourteen years.

Mr. William John Cook, surveyor to the Aylesbury Rural District Council, who has retired owing to ill-health, has received from the council a resolution "recording their appreciation of the twenty years' service rendered by him as surveyor," and expressing the hope that he may live many years to enjoy his retirement.

FOR OTHER ADVERTISEMENTS
See End of Paper.

RURAL DISTRICT COUNCIL OF MUTFORD AND LOTHINGLAND.

TENDERS FOR GRANITE.

The Council invite Tenders for the Supply of Granite during the period ending 31st March, 1916.

Forms of Tender and further information may be obtained of the Council's Surveyor, Mr. H. Blewitt, Council Offices, Oulton Broad, Lowestoft.

Sealed Tenders, marked "Tender for Granite," and Samples of Granite must reach me not later than 12 o'clock noon on the 20th inst.

The Council do not bind themselves to accept the lowest or any Tender.

W. BRYAN FORWARD,
Clerk.

148 London-road N.,
Lowestoft.
April 7, 1915. (2,530)

GOSPORT AND ALVERSTOKE URBAN DISTRICT COUNCIL.

Tenders are invited for the conversion of a pair of 18-in. stroke horizontal cross high-pressure, independent condensing, tandem-driven, double-acting Air Compressors, fitted with silent-running, mechanically operated air compressor inlet and delivery valves, into two pairs of horizontal cross compound independent condensing, and tandem-driven, double-acting Air Compressors, fitted with silent-running, mechanically operated Air Compressor inlet and delivery valves, with all necessary valves, pipe connections, foundations, &c. A copy of the Specification, Plan and Form of Tender may be obtained from the Surveyor to the Council on receipt of a Guinea (returnable). Tenders, addressed to the Clerk to the Council, and endorsed "Tender for Compounding Air Compressors," to be delivered at the Council Offices at or before Noon, May 13th.

The Council do not bind themselves to accept the lowest or any Tender.

H. FROST,
Engineer and Surveyor to the Council.

Gosport.
April 7, 1915. (2,527)

NEWMARKET RURAL DISTRICT COUNCIL.

TENDERS FOR ROAD MATERIALS.

The above District Council invite Tenders for the Supply of the following Road Materials to be delivered at the following Railway Stations—viz.: Six-mile-bottom, Dullingham, Newmarket, Kennett, Swaffham Prior, Bottisham, Burwell, Fordham, Soham and Isleham (G.E.R.), at such times and in such quantities as may be ordered by the Council or their Surveyor:

6,000 tons (more or less) of 1¼-in. to 2-in. gauge Best Broken Leicestershire Granite and ¼-in. Chips.
1,000 tons of Slag.

Tenders, on Forms to be obtained at my Office, to be returned to me, with Samples, marked "Tender for Road Materials," not later than 10 a.m. on Tuesday, the 20th day of April instant.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

FRED. J. BLACKBOURN,
Acting Clerk to the Council.

Deva Chambers, Newmarket.
April 6, 1915. (2,528)

COLOMBO MUNICIPAL COUNCIL, CEYLON.

APPOINTMENT OF ASSISTANT ENGINEER.

The Colombo Municipal Council requires the services of an Assistant Engineer who has a general knowledge of Municipal duties and, in particular, of Waterworks.

Candidates should be unmarried, and not more than 30 years of age, and must have been articled to a Civil Engineer, and obtained experience on some Waterworks of importance, and possess a thorough knowledge of all works pertaining to Waterworks Engineering, and also of Municipal Engineering in general.

Salary Rs.4,500/- per annum, with a commuted allowance of Rs.900/- per annum.

The selected candidate will be required to pass a medical examination by the Consulting Physician to the Colonial Office.

The gentleman appointed will be required to enter into an agreement to serve the Municipal Council for a period of three years in the first instance.

Passage to Ceylon (first-class by a mail steamer, or second-class by a mail steamer) will be provided, and half salary will be paid during the voyage out.

Should the services of the officer be not required at the expiration of the three years for any reason other than misconduct, or should the officer desire to terminate the appointment, a free passage to England will be provided by the Council.

Letters of application, stating age and qualification, and accompanied by copies only of recent testimonials, should be forwarded to R. Eustace Tickell, Institution of Civil Engineers, Great George-street, Westminster, and must be received not later than 1st day of May, 1915.

Envelopes enclosing applications must be endorsed "Assistant Engineer, Colombo."

(By order)

E. H. JOSEPH,
Secretary, Municipal Council.

The Municipal Office,
Colombo. (2,529)

ENGINEER'S or Surveyor's Assistant requires situation; 12 years' experience; architectural, engineering and surveying experience; P.A.S.I.; moderate salary.—Box 2,519, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (2,531)

FOR SALE.—A Leicestershire Granite Quarry in full working order.—Apply, Bland, Carryer & McAlpin, 6A St. Martin's, Leicester. (2,532)

The Treatment of Waste Liquors from Bleach, Print and Dye Works.—(VIII.)

By G. BERTRAM KERSHAW, M.A.M.SOC.C.E., M.INST.C.E., Late Engineer to the Royal Commission on Sewage Disposal.

Although these [illegible] chiefly [illegible] Lancashire, Yorkshire, [illegible] other districts, [illegible] but with an [illegible] parts of the country. A [illegible] are carried on in the same premises.

The substances [illegible] rather widely, according to the material which is being dealt with and the [illegible] at a particular mill.

Very large quantities of wash waters are [illegible] with be gathered from the processes through which the cloth passes, and which are described below.

BLEACHING.

The pieces [illegible] kiers containing milk of lime [illegible] to remove the weavers' size which is added to the cotton thread before weaving; the cloth is then washed, "soured" with dilute acid (grey sour), and again washed; it is then again boiled with soda ash and [illegible] solution, which [illegible] and washed.

The kier liquors are exceedingly alkaline and impure, containing [illegible] starch and gummy substances; they are generally mixed with waste liquors from the print and dye houses. Dealt with by itself, it is a most difficult liquid to treat, since it would not pay to recover the soda by evaporation, as is the case with the liquors from esparto boiling in the paper-making industry, and, if mixed with the other bleaching liquors, arrangements should be made to run the kier liquor gradually into the other liquors from a storage tank.

The plan of adding septic sewage sludge to this type of refuse has been tried as a preliminary to artificial filtration, thereby carbonating the caustic alkali, with somewhat disappointing results as regards the type of effluent produced, while the bulk of sludge to be disposed of is increased.

The following figures, [illegible] as representative of a typical soda kier liquor:—

	Parts per 100,000
Ammoniacal nitrogen ...	20
Total	175
Oxygen absorbed from permanganate in four hours at 80 deg. Fahr. ...	75
Total solids...	900
Caustic alkalinity	220
Dissolved oxygen taken up in five days at 60 deg. Fahr. ...	68

Schiele, speaking of kier liquors derived from bleaching, mentions that superficial purification can be obtained by storing the alkaline liquors in reservoirs, and mixing the acid liquors gradually with them, after which the mixed liquors are clarified in settling tanks. It is stated that the liquor so dealt with can be treated by biological [illegible]

Keller, of Stuttgart, re-uses the alkaline liquors, adding dissolved or undissolved lime to them, with constant stirring, by which the liquid assumes a brighter colour. The liquor decanted from the lime is then re-used as it is or further concentrated.

In this country the usual treatment in use for the mixed liquors is settlement, sometimes with a precipitant, such as alumino-ferric, followed by straining filters. It would seem to be helpful if the alkalinity of the kier liquors were neutralised before discharge by the acid liquors contained in the other wastes.

It may be mentioned that cotton waste from spinning mills, destined to be utilised in the manufacture of gun-cotton, also undergoes a bleaching process, being subjected to boiling with a dilute solution of caustic soda, after which it is bleached.

In the case of greasy cotton wastes it is usual to treat them before kiering to a process devised to extract the grease.

PRINTING.

There are many methods of printing in use at the present day. The colouring substances used for printing are [illegible] paste [illegible] gum, starch flour, or some other glutinous loading, to cause the colour to adhere to the printing rollers. These are made of copper, and are engraved with the design which it is desired to imprint on the fabric. Some printing machines have several of these rollers, each being engraved with a portion of the pattern to be printed, and each roller being supplied with a separate colour. The rollers revolve in a trough containing the colour paste; all the colour, however, with the exception of that lying in the engraved portions of the roller, is removed before coming in contact with the fabric by a steel scraper, technically termed a "doctor," running the whole length of the roller and just touching it. The cloth when printed is passed through a hot soap solution and afterwards washed. In many cases mordants are used.

A large quantity of clean water is required in the printing industry, not only for washing the printed cloth, but also for washing the engraved copper rollers, colour vats, &c., and the waste waters from a print house are highly coloured, soapy liquids, resembling the wastes from a dye house, but containing more suspended matter. The suspended matter, as would be anticipated, is mainly inorganic, and the amount of dissolved oxygen taken up by dye wastes is not very great, some 10 parts per 100,000 being perhaps a usual figure for five days at 60 deg. Fahr.

Concerning the treatment of wastes from the print house. These are generally mixed with the wastes from the bleach and dye houses, and treated by means of settlement in tanks. Precipitants are usually employed, and in most cases the tank liquor is passed through rather shallow cinder or clinker filters; the filtration, however, generally partakes of the nature of mechanical straining, owing to the excessive rate at which these filters are almost invariably worked.

It should be noted that a somewhat heavy dose of precipitant is often needed prior to tank treatment, owing to the presence of soaps in the waste liquors.

Very large quantities of sludge are produced, and this is chiefly disposed of by tipping on waste ground. It appears to possess little, if any, manurial value.

DYEING.

In this process the dyes formerly used were obtained from infusions of various woods; at the present time, however, aniline dyes have almost entirely superseded the dyes extracted from woods, and—as will be gathered from the correspondence in the newspapers during the past few weeks regarding the aniline "dye scheme"—the bulk of this industry of preparing aniline dyes is in the hands of the Germans at the present day, and it appears likely to remain there, judging from the lack of success which usually attends any industry with which the Government of this country meddles.

The processes of dyeing used vary very much in detail, and it is not necessary for present purposes to enter into all these details.

The direct dyeing process may be described generally as passing the cloth to be dyed through a vat containing a hot solution of dye, after which it is treated with a starch solution and washed. In the indirect dyeing process mordants are used, and the dyed cloth is finally washed in large volumes of clean water. The more delicate the tint of dye required in the finished cloth, the cleaner must be the water employed for washing purposes.

The waste waters produced during the process of dyeing are very variable in character, and are usually highly coloured and acid; they also contain, as a rule, many solids, both in solution and in suspension. The contents of some of the vats are frequently quite hot when discharged, and when the discharge takes place into town sewers, nuisance from smell is likely to arise.

The following figures, taken from an analysis made by Mr. Ed. Halliwell, F.I.C. (Seventh Report, Royal

Commission on Sewage Disposal, Vol. III., Part II., p. 430, shows the nature of crude aniline dye waste:

	Parts per 100,000
Ammoniacal nitrogen	·65
Organic nitrogen	1·03
Oxygen absorbed in three minutes ...	17·5
Oxygen absorbed in four hours	64·6
Suspended solids	252·
Oxygen absorbed in three minutes, after incubation	14·4
Odour	No H_2S

Regarding the treatment of the waste waters, chemical precipitation, followed by filtration, reduces the colour somewhat at first, but some dyes are very persistent and difficult to remove, and heavy doses of precipitant are apt to increase the hardness of the effluent, to the detriment of users of the water lower down the river or stream.

When, as is often the case, the waste waters from the bleach, dye and print houses are mixed together before treatment, the acid dye waters tend to neutralise the alkaline kier liquors from the bleach house, and mixing is useful for this reason.

It should be added that where genuine indigo is used as a dye, most dyeworks have a special plant for treatment of the waste waters, and the indigo sludge is re-used.

Large quantities of sludge are produced in the drying processes, and so far no use appears to have been found for it other than the filling up of waste land.

At one very large dyeworks with which the writer is acquainted the sludge is conveyed along an elevated wire ropeway to a large valley adjoining the settling tanks, and many thousands of tons of semi-dry sludge have been tipped here, gradually filling up the valley.

At some works the liquid sludge is run on to steam straining beds, formed of a bed of cinders 9 in. to 12 in. or more in depth, the sludge being removed by spade labour when sufficiently dry to manipulate.

It may be noted that the colour resulting from the use of certain dyes is extremely difficult to remove from the waste waters, and also from a sewage which contains them in any quantity, and in this connection the writer has noticed that really good land appears to be far more efficacious in removing the colour than either contact beds or percolating filters.

At the Nottingham Corporation sewage farm large quantities of dye frequently reach the sewers from the dye houses in the Leen Valley; but, although the dye on occasion shows very plainly in the liquid in the carriers on the farm, it is never seen in the effluents after they have passed through the land.

It is quite possible that some as yet little understood action may occur with some soils and subsoils, which is less pronounced, or even altogether absent, in the case of artificial filtering media.

As with brewery wastes, dye waters should not be discharged at a high temperature into town sewers, or nuisance from smell is probable.

Tieneman has recently stated that many colouring substances, although non-poisonous to men, have a strongly poisonous action, even when highly diluted, upon very varied species of organism in water. Victoria blue, methyl violet, charcoal black, and diamond green B have been found to prove particularly fatal to fresh-water organisms, and they may therefore be indirectly harmful to fish, by destroying the lower organisms in the water upon which the fish mainly subsist.

It is well known that many dye wastes contain mordants which are directly [illegible] to fish-life.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law. A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is not the city of Exeter to be congratulated on having broken down the fetish of always accepting the lowest tender for the execution of public works? Have there not been frequent cases where local influence and prejudice have been the means of tenders being accepted from persons possessing neither the plant nor the experience necessary for the carrying out of particular works, with the result that the surveyor has had an evil time while the works were in progress, and litigation and great expense have often followed?

* * * *

Why is Paddington the only station in London that was properly designed for the comfort of the passengers and the speedy disembarking of luggage? Is it not rather curious that Victoria, which is one of the latest designed stations, should be so hopelessly inconvenient, especially at times of any extra traffic?

* * * *

What will be the general opinion among sanitary engineers of the recently issued Final Report of the Royal Commission on Sewage Disposal? Should we not feel very grateful that what was at one time chaos has been brought into something like order, and that the sixteen years' work of the commission has not been in vain? Whether we shall agree or not with all the recommendations remains to be seen, but will not the study of all the reports, including the Final Report, give us an opportunity of acquiring a mass of knowledge on the interesting and complicated problems of sewage disposal?

* * * *

Have not surveyors good cause to envy skilled mechanics at the present time when we hear from the newspapers that they are earning something like £6 a week for four days' work? Are there many surveyors in the country who can command such salaries, and at the same time take 104 days' leave during the year in addition to the legal holidays?

* * * *

What will eventually be done with the Belgian roads, which are reported to be now ploughed up by the German men of "kultur"? Does it not become more and more evident that English road engineers will be required to set things right eventually in that devastated country?

* * * *

Why is it that the *men* in the trenches have not struck because they can't get Easter leave and time off on Sundays? Who would have thought, at the commencement of the war, that the only allies the Germans could command, in addition to Austria, were some of the "working men" of this country?

* * * *

Have not some of the "thousands" recently published in the papers shown that high wages are synonymous with idleness? And what is to be the remedy?

* * * *

Does not the "house list" for balloting for members of the council of the Institution of Civil Engineers rather indicate that municipal engineers and surveyors are not required? Why cannot the municipal engineers of this country form a "trades union," and combine in the endeavour to receive more recognition?

The Civic Engineer's Who's Who, compiled by the editor of The Surveyor and Municipal and County Engineer, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

G.P.O. and District Council.—Judge Smyly, at Bow County Court, recently decided a dispute between the Postmaster-General and the Leyton Urban District Council. The Postmaster-General desired to place at various points on the public way ten poles for the purposes of carrying telephone wires, but the council contended that the wires should be conveyed underground, and also alleged that the erection of the poles at the points suggested would lead to a nuisance. The judge made an award in favour of the Postmaster-General, subject to the conditions that the poles should be placed as near the kerb as the safety of the traffic would permit.

BUILDING AUSTRALIA'S CAPITAL CITY.

Work is proceeding substantially in connection with the construction of Australia's capital city, Canberra. Extensive [illegible] being formed 3 miles outside the city boundary. A site has been selected for the construction of a dam to [illegible] the water from the Queanbeyan River, in order to force a continuous stream into the Molonglo, which flows through the Federal capital territory. The cost of the dam will be about £80,000. On the Cotter River, 20 miles from Queanbeyan, a dam [illegible] is erected to store water for the supply of the capital. Although the rainfall has been light [illegible] mated there was a flow sufficient to supply Melbourne. From this dam the water is run in pipes through a tunnel cut in the hill to a big reservoir at Red Hill.

The electric power plant, which will generate sufficient power for lighting and industrial purposes in the city, and is to cost £60,000, is approaching completion.

Extensive nurseries contain large plots of healthy trees, which are to beautify the streets and avenues of this model city, and the work of actually laying out the capital may be expected to proceed without much delay. The Australian Government has acquired an area of 900 square miles, to be known as the Federal Capital Territory. This land is to be held by the Commonwealth and leased to occupants.

LONDON SANITARY COMPANIES AND THE WAR.

The two London Sanitary Companies are going strong. Originally limited to an establishment of five officers and a hundred men apiece, they have already sent more than twice as many to the Front, and have now as many more awaiting orders.

During the early months of the war the Sanitary Companies were completing their training at Chelsea, without any ideas as to how, when, or where they would be employed; but, in spite of this uncertainty, men from the various branches of the public health service of the country came forward eagerly to fill the ranks of the companies. Their faith has been more than justified, for to these two companies, Territorials though they are, has been entrusted the important duty of looking after the sanitary welfare of the troops at the Front, a sanitary section, under an officer, being attached to each division.

Interesting letters describing their work and experiences are now coming to hand from the men of these sections. The work varies in different divisions, but it is gratifying to note that it is by no means confined to the rougher sanitary duties, which are for the most part discharged by fatigue parties from the combatant units. The skilled personnel of the Sanitary Sections is largely employed in special work, such as the inspection of camps and billets, disinfection, building incinerators, and, most important of all, the sterilisation of the water supplied to the troops. Another duty closely affecting the comfort of the men in the trenches is that of making provision for drying their clothes, and giving them baths.

The men of the Sanitary Section have to camp in a bit, like the rest, but they are well fed, and, judging from their own account of themselves, they are having the time of their lives.

Their work is winning high commendation from the powers that be, and its results are seen in the wonderful healthiness of the troops. The drop from 57,684 cases of enteric in South Africa to just over 600 so far in the present campaign is an eloquent tribute to the efficiency of the preventive measures of which the work of the Sanitary Companies forms a part.

Authority has now been given for the formation of a fourth unit of each of the parent companies, and recruiting is now actively in progress for these, and to fill the gaps in the existing units due to the despatch of sections to the Front. We drew attention last week to the needs of the 1st London Sanitary Company. We are pleased to learn that the ranks of the 2nd London Sanitary Company are fast filling up, but there are still vacancies for a few qualified men, who must be prepared to take the Imperial Service obligation. Intending recruits should communicate forthwith, personally or by letter, with O.C., 2nd London Sanitary Company, or with O.C. Depot, Medical Units, 2nd London Division, Duke of York's Headquarters, Chelsea, S.W.

The [illegible] Medical Corps, it is naturally desired that it shall be officered, as far as possible, by medical men. We are, however, pleased to note that commissions have recently been granted to Mr. Herbert Beeney, surveyor to the Chertsey Rural District Council, and to Mr. E. Brooke Pike, chemist-in-charge of the northern outfall works of the London County Council.

BALLAD OF THE [illegible] LONDON SANITARY COMPANY.

(1)

[illegible]
Hurry up [illegible] your lot
Say Goodbye [illegible] Mary,
Cheer ahoy! [illegible]
Somewhere [illegible] France [illegible]
Bring [illegible]
Where the [illegible]
Kaiser Bill what they can do.

(2)

Well! we're ready, fit, and willing,
Glad the day has come around,
For we're just fed up with drilling,
And we're [illegible]
We [illegible]
[illegible]
All the [illegible] that knock
Into cocked hats in a day.

(3)

We are [illegible] that water
Must be purified and still to drink,
And to make it safe we sterilise
A pint to a gallon consumers' tank.
Diagrams we've drawn and studied
[illegible]
We can drain a field that's flooded,
Count the germs on legs of flies.

(4)

We can [illegible]
Sink [illegible] and wells,
We're the [illegible] installers
Of the [illegible] smells.
We can [illegible] with the ladies,
Fix a broken leg in splints,
[illegible]
[illegible]

(5)

[illegible]
Of the [illegible] are our lot.
Not much scope for deeds of glory,
Oh [illegible]
But as [illegible]
"Fall in" there, and pack your kit;
[illegible]
After we have "done our bit."

W. J. A. J.

Town Planning Institute.—At a meeting of this body to be held on Friday next, the 16th inst., at 92 Victoria Street, S.W., Mr. W. T. Lancashire, M.INST.C.E., the city engineer of Leeds, and Mr. H. V. Lanchester, F.R.I.B.A., will open a discussion on "Replanning and Redevelopment in Existing Centres." The chair will be taken at 8 p.m.

A New Urban District Council.—Spenborough, the new West Riding urban district, came into existence officially last week. It is formed by the amalgamation of Cleckheaton, Liversedge, and Gomersal, and constitutes the largest urban district in Yorkshire. The total area is 5,170 acres, and the total population, according to the last census, 31,321, made up as follows: Cleckheaton, area 1,755 acres, population 12,867; Liversedge, 2,316 acres, population 14,658; Gomersal, 1,099 acres, population 3,796.

A Rhyl Pier Scheme.—The *Liverpool Post* states that, after many months of delay, the Rhyl Urban District Council are now in a position to do something with their pier. Plans have been prepared by the surveyor, Mr. A. A. Goodall, and the estimated cost is £4,300. It has been decided to apply to the Local Government Board for the loan, and for a sum to cover the purchase price (£1,000), as well as the costs of the litigation which arose over the first scheme.

Dewsbury Corporation and Trade Effluents.—When the Dewsbury Corporation Bill was before the Local Legislation Committee of the House of Commons the trade effluent clauses were endorsed by all firms except laundry proprietors. It was argued on their behalf that laundry effluent was only like washerwomen's soapsuds, and that it was "domestic" and not trade effluent. The Chairman announced that the Committee's decision was against the Laundry Association.

Vide Captain Caley on "The Lower Forms of Life."
† Some may prefer "Johnny Walker;" it is a matter of taste.

PUBLIC BATHS.

TAUNTON CORPORATION'S SCHEME.

The subject of public baths came before the recent South-Western District meeting of the Institution of Municipal and County Engineers at Taunton in a paper submitted by Mr. D. Edwards, Assoc.M. Inst.C.E., the borough engineer and surveyor. The corporation are embarking on a scheme of public baths, and Mr. Edwards exhibited to the members plans of the proposed buildings, afterwards proceeding to make the following observations:—

The scheme consists mainly of a swimming bath 75 ft. long by 35 ft. wide, being of sufficient width for polo playing, with a depth of water 3 ft. 3 in. and 5 ft. 6 in. at the ends, and a depth of 6 ft. 9 in. 18 ft. away from the deeper end, for diving purposes. The clear width of the gangways is 5 ft. 8 in. from front of dressing boxes to edge of bath. There are forty dressing boxes provided, each 3 ft. 9 in. by 3 ft. 9 in., and two foot baths. At the entrance end there is a space of 18 ft. 6 in., sufficient for the erection of a temporary platform for the witnessing of galas, &c. Subways are provided under one long gangway and one short one, for the purpose of laying and maintaining pipes. The water will be heated by steam injection of the circulated water. There is no provision for boilers necessary, as the steam will be supplied from the electric light works close by, and supplied at a pressure of 150 lb., which, of course, will have to be reduced to about 15 lb. There are six slipper baths provided in such a position that three can be used by the particular sex not using the swimming bath at the particular time and without entering the swimming bath hall, while the other three can be used by the other sex.

Coming to the actual construction of the walls of the swimming pond, many baths lately have been built in reinforced concrete, but the cost of such construction, in my opinion, is greater than ordinary 4 to 1 cement concrete. The walls built in this way have to be about 3 ft. 6 in. thick at the bottom if the depth of water is 6 ft. 6 in., and, in addition to less cost, there is greater reliability of watertightness. This is an important factor in the construction of baths, especially if the ground upon which it is built is not of a solid nature.

It is a question of some little doubt in my mind whether it is necessary to incur the expense of lining the pond with a layer of asphalt, although I have known some baths where this has been considered necessary.

There are several minor details which should be considered of considerable importance, from the point of view of utility and economy. For instance, it is questionable, in my mind, whether it is necessary to provide doors to the dressing boxes. Usually these are constructed to a height of about 4 ft. 6 in. I do not think the expense is warranted. Of course, there are good reasons for the provision of doors to the dressing boxes in a bath reserved only for adults, but, where boys are concerned, it is advisable that they should be under observation in some instances, and the chances of pilfering are greatly reduced by the fronts being open. It is proposed in this scheme to reserve one set of boxes (for adults) with doors of the usual height, and the remainder (for boys) without doors.

The expenditure allowed is £3,000, exclusive of the purchase of the site.

The Chairman (Mr. F. Parr, Bridgwater) said the scheme appeared to be one which could be relied on. There was nothing in it which one could find fault with. At Bridgwater they had open baths, the water being taken from the stream, and they had no end of trouble—in fact, the water was not as it should be for bathing purposes. He had pleasure in proposing a hearty vote of thanks to Mr. Edwards for his valuable paper.

Mr. F. W. Jones (Frome), in seconding the vote of thanks, remarked that the number of slipper baths seemed insufficient.

Mr. S. Hutton (Exmouth) asked Mr. Edwards if he had any reason for placing the deep end of the bath at the entrance.

Mr. Edwards: No special reason.

Another member asked if it was necessary to have 3-ft. walls.

The vote of thanks was carried with acclamation.

In replying, Mr. Edwards stated that no provision was made in the scheme for a gallery, but there was sufficient space to accommodate 250 persons by utilising the spacious gangways which were provided round the baths. As regards the height of walls, the height was 20 ft. to the eaves, which he considered was the minimum allowed for public baths. The number of slipper baths was undoubtedly too small, but the cost would not admit of a larger number just at present.

THE "SIMPLEX" CHEMICAL FIRE EXTINCTEUR.

Probably few of the many varieties of chemical fire extinguishers before the public can claim much conformity with the rules laid down for these appliances by the fire offices and British Fire Prevention Committee. Failure to withstand pressure at the moment of operation—through choking, the effects of rust and corrosion, or inherent weakness of construction—is the common drawback. As there is no doubt that these small hand fire engines, when properly designed and constructed, can often prove of enormous value, it is a matter for congratulation that Messrs. Mather & Platt, Limited, of Park Works, Manchester, have devoted their attention to them, and have produced an appliance that they claim can be depended on under all conditions.

The form of "Simplex" extincteur now made by Messrs. Mather & Platt, Limited, has been specially designed to meet the requirements of the British Government, who have placed with the firm an order which is believed to be the largest ever given for fire extincteurs in this or any other country. The type of extincteur which Messrs. Mather & Platt are now putting on the market is identical with the Government appliance in every detail with the sole exception of the Royal cipher.

The "Simplex" extincteur depends for its operation on the reaction of sulphuric acid upon a bicarbonate of soda solution. The acid is contained in a hermetically sealed bottle suspended over the liquid, which is discharged through the jet upon smashing the bottle by striking a knob at the top of the extincteur. The fluid, which has great extinguishing power, is ejected to a distance of 50 ft. to 60 ft.

In this appliance there are no valves or rubber hose, while the jet orifice is protected from glass splinters or other foreign material by a cone-shaped sieve. An opening at the top, 3 in. in diameter, is provided, through which the acid bottle can be withdrawn should it be desired to examine the interior.

The body of the extincteur is constructed of 16s S.W.G. steel, and tested hydraulically to a pressure of 350 lb. It is coated thickly with lead in the centre and with tin at the top and bottom, both inside and outside, to prevent corrosion, and every seam is riveted as well as soldered. The chemicals with which the machine is charged undergo no change, and the extincteur will operate as satisfactorily after ten years as on the day on which it was first charged.

Messrs. Mather & Platt have just issued a catalogue relating to their fire extincteurs; copies can be had on application.

Successful Boring for Water at Howden.—Satisfaction is felt in the Howden rural district at the successful results of the experimental boring for water at South Newbald. At first the boring results were discouraging, but they were persevered with, and now a copious and ample supply has been secured. The water, which is filtered through the chalk, is of great purity. According to an estimate made some time ago, the water supply scheme for the district will cost about £60,000. The scheme will not be proceeded with until after the war.

A CHAIR OF CIVIC DESIGN AT THE UNIVERSITY OF LIVERPOOL (FACULTY OF ARTS).

[The council of the University are inviting applications for this Chair, which is associated with the School of Architecture, and in view of the important nature of the proposed appointment as municipal engineering work we give below the following details (as altered) as furnished by Mr. Edward Carey, the registrar.]

(1) The duties of the Professor will commence and the appointment date from October 1, 1915. The appointment will be for four years, the period during which the endowment of the Chair is secured.

(2) The stipend of the Chair is fixed at £400 per annum. The Professor will be allowed, but not required to become a contributor to the superannuation scheme.

(3) The Professor will be required to work during the Autumn and Lent terms of each session, from the beginning of October to about the end of March, with three weeks' vacation at Christmas. He will be responsible for the encouragement of research into the problems connected with the design and development of towns, and research being held to include the production of drawings of schemes for the treatment of specific problems, as well as critical and historic surveys of existing work; (b) the publication of the results of this research; (c) the guidance and supervision of research students in the subjects of the Chair. It is also such part in the degree and other examinations of the University as in the opinion of the Professor and on the recommendation of the Senate and the Faculty of Arts, may determine, and to hold or be responsible for such terminal examinations in the Faculty of Arts as may be

(4) A lecturer, also holding a Research Fellowship, is associated with the work of the department. There are several special lecturers taking single courses of lectures.

(5) The Professor will be allowed while in residence to carry on the practice of his profession on conditions already determined by regulations. Such work, however, must be undertaken only to such an extent as shall not interfere with the duties of the Chair.

(6) Candidates are expected to give a detailed statement of schemes already executed or projected by them, to accompany it with plans and state age and to supply details of published or written work.

(7) Applications, together with the names of three persons to whom reference may be made, and twelve copies of not more than six testimonials, should be forwarded to the undersigned on or before May 10, 1915. Original documents should not be forwarded.

STOCKTON BOROUGH ENGINEERSHIP.

Applications numbering 126 were received for the post of borough engineer of Stockton, and the following have been chosen for a personal interview in committee, with a view to the selection of one of their number for submission to the town council: Mr. G. H. Whittaker, Assoc.M.Inst.C.E., chief assistant, borough surveyor's department, Sunderland; Mr. H. R. Crabb, Assoc.M.Inst.C.E., borough engineer, Pembroke Dock; Mr. F. Wilkinson, Assoc.M.Inst.C.E., deputy borough engineer, Wimbledon; Mr. F. G. Beaumont, deputy surveyor, Wolverhampton; Mr. T. P. Frank, Assoc.M.Inst.C.E., borough surveyor, Newark; and Mr. G. C. Mitchell, assistant borough surveyor, Stockton.

The salary is £500 a year, rising by annual increments of £25 to £700.

Remaking of Belgium Exhibition. — Mr. Frank Brangwyn has prepared a striking poster for this exhibition, which will take place at University College, Gower-street, W.C., during the present month. The Right Hon. Viscount Bryce, O.M., has promised to open the exhibition at 4 p.m. on April 7th. Study circles for Belgian architects, engineers, and lawyers who will be engaged upon actual town plans later on will be started at the same time. Invitations to the opening ceremony may be obtained from Mr. Ewart G. Culpin, secretary, Exhibition Committee, University College.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President: Mr. J. S. Pickering, M.Inst.C.E., Borough Surveyor and Water Engineer, Cheltenham.

EASTERN DISTRICT.

An Eastern District meeting is to be held at the offices of the institution, 92 Victoria-street, to-morrow (Saturday), at 3.30 p.m.

Agenda.

1. To confirm minutes of previous meeting.
2. Discussion on use of bituminous material (continued).
3. Discussion on "Heavy Traffic."
4. Any other business.

J. A. Wild,
Hon. District Secretary.

Great Stanmore.

EAST MIDLAND DISTRICT.

An East Midland District meeting is to be held at the Town Hall, Loughborough, to-morrow (Saturday).

Programme.

2.15 p.m.—The members and visitors will be received in the Council Chamber by the Mayor of Loughborough (Mr. W. W. Coltman, J.P.).

2.30 p.m.—To receive minutes of last meeting.
To elect district committee.
To discuss election of district representative, district chairman, and district secretary.
To consider any other general district business.

3 p.m.—Proceed in conveyances (at a charge of 1s. per person) to inspect the swimming baths, where members will be given the opportunity of inspecting an apparatus for teaching swimming, erected by Messrs. Herbert Morris, Limited, of Loughborough.
Proceed to sewage farm to inspect refuse destructor and other works.

5 p.m.—Arrive at town hall, where tea will be provided by the borough surveyor, Mr. A. H. Walker, Assoc.M.Inst.C.E.

E. H. Crump, Assoc.M.Inst.C.E.,
Hon. District Secretary.

Hinckley.

INSTITUTION OF MUNICIPAL ENGINEERS.

President: Mr. W. H. Matthews Jones, City Engineer and Surveyor, Chester.

COUNCIL MEETING.

At a meeting of the council, held in London on March 26th, the following applicants were recommended for admission:—

To Membership: Messrs. A. R. Heritage, highway surveyor, Cookham Rural District Council; W. Ellis, engineer and surveyor, Barnoldswick Urban District Council; L. Taylor, building surveyor, &c., Saddleworth Urban District Council; and G. G. Forster, deputy borough engineer, Middlesbrough.

To Associate Membership: Mr. J. W. Nelson, surveyor, Westmorland Rural District Council.

New Members, &c.—From the applicants recommended for admission at the last meeting one member and two associate members were elected.

Departmental Committee on Building By-laws.—In response to the request of this committee of the Local Government Board, a memorandum embodying the views of the institution has been prepared, and the secretary was instructed to send a copy of it to the committee.

Revision of Institution By-laws.—This matter is under the consideration of the General Purposes Committee, who will present their report in due course.

Architects' Registration Bill.—A communication was read from the Society of Architects stating that no further action would be taken as regards this Bill during the present crisis, and that the proposed conference between the society and the institution must therefore be held over.

Council Meetings.—It was decided that London

council meetings should be held on the last Wednesday in the month at 5.30. The next meeting will therefore be held on April 28th.

B. Wyand.
Secretary.

39 Victoria-street, S.W.

NORTH-EASTERN AND EASTERN DISTRICTS.

A meeting of the North-Eastern and Eastern Districts of the institution will be held at Newark-on-Trent on Saturday, April 24th.

1.45 p.m.—Meet at the Saracen's Head Hotel, and proceed to the inspection of old castle ruins. En route Ossington Coffee Palace, Trent Bridge and free library will be pointed out.

Parish church (exterior and interior). A short organ recital will be given by Mr. W. F. Wright, A.R.C.O., organist.

Old Magnus Buildings, with Tudor Hall, recently restored at a cost of £2,000 by Mr. H. W. Lockton, M.S.A. (member).

Various old buildings in Market-place.

Beaumond Cross.

New Magnus Grammar School (by the kindness of the Rev. H. Gorse, M.A., head master), designed by Mr. Lockton, and carried out at a cost of over £10,000.

5 p.m.—High tea at the Saracen's Head Hotel, at a cost of 2s. 6d. per head.

Short descriptive notes of the visits will be given by Mr. Lockton, and by Mr. P. A. Watford (member), surveyor, Claypole Rural District Council.

Members of the Yorkshire and other districts are invited to attend.

G. Belson Chilvers.
Hon. District Secretary.

Oundle, Northants.

SOUTHERN AND SOUTH-EASTERN DISTRICTS.

A visit will be paid on Saturday, April 24th, to the New County Hall Works of the London County Council.

Members will meet on the site of the works, Belvedere-road, Westminster Bridge, at 2.30.

The contract now in progress embraces roughly some three-fourths of the complete building (the northern blocks being not yet commenced), and the bulk of the work is at about second floor level.

Members contemplating attendance are requested to send me a card.

Arthur Palmer.
Hon. District Secretary.

Town Hall,
Greenwich.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Tuesday next at the Institution of Electrical Engineers, Victoria Embankment, W.C., a paper, entitled "Main Roads, Past and Present, and Modern Methods of Construction and Maintenance," will be read by Mr. Frank Grove, M.I.M. and Co.E., assistant county surveyor of Surrey, the following being a synopsis:—

Brief history of roads from the time of the Romans to the present day—Traffic requirements immediately prior to the introduction of self-propelled vehicles—Details of road construction at that time—Effects of motor traffic on the old type of roads, and some methods employed to cope therewith—Description of a few of the modern methods of road construction and maintenance employed during recent years in the county of Surrey.

The chair will be taken at 7.30 p.m.

S. E. Redman,
Secretary.

17 Victoria-street, S.W.

An Expert Wanted.—Mr. William H. Eley, engineer and surveyor, Town Hall, Newmarket, writes: "My council are anxious to appoint an expert to test the illuminating power of the street lamps, as provided by the contract between the council and the gas company. I am anxious to obtain from other councils the names and addresses of their expert in this matter so that I may submit them to my council. Perhaps the publicity of your columns would enable me to obtain the desired information."

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

CLERK OF WORKS.—April 10th.—Llandaff and Dinas Powis Rural District Council. £2 2s. per week.—Mr. J. Holden, surveyor, 20 Park-place, Cardiff.

SURVEYOR.—April 10th.—Horncastle Rural District Council. £2 per week.—Mr. J. E. Chatterton, clerk.

ROAD FOREMAN.—April 13th.—Chesham Urban District Council. 32s. 6d. per week.—Mr. Percy C. Dorman, engineer and surveyor, Council Offices, Chesham, Bucks.

ASSISTANT SURVEYOR.—April 16th.—Wellingborough Urban District Council. £120 per annum.—Mr. J. T. Parker, clerk, 29 Church-street, Wellingborough.

ASSISTANT IN BOROUGH SURVEYOR'S OFFICE.—April 17th.—Corporation of Dorchester.—Mr. H. D. Strange, borough surveyor, North-square, Dorchester.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

WHITEHAVEN.—April 21st.—Competitive designs for laying out the coach road site (6 acres 1 rood 25 poles) and the erection of houses, for the town council. Premiums, 30, 20 and 10 guineas.—Mr. T. Brown, town clerk.

GALEMIRE.—Designs for a small hospital, for the Galemire (Whitehaven) Joint Hospital Committee.—Mr. E. B. Croasdell, clerk, Union Hall, Whitehaven.

STEPNEY.—Designs for municipal buildings, for the borough council. Mr. H. T. Hare, F.R.I.B.A., has been appointed assessor.—Mr. G. W. Clarke, town clerk, 15 Great Alie-street, Whitechapel.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

STREET.—April 12th.—For [illegible] station and works, for the urban district council.—Mr. W. H. Cousins, surveyor, Council Offices, Street, Somerset.

TYRONE.—April 12th.—For additions to Dungannon [illegible] and [illegible] the county council.—Mr. [illegible] Dungannon.

EASINGTON.—April 13th.—For the erection of fifty houses, and the construction of streets, for the rural district council.—Mr. G. Waterhouse, [illegible] Council Offices.

GLAMORGAN.—April 14th.—For the [illegible] bridge, for the county council.—County Hall, Cardiff.

BRADFORD.—April 15th.—For excavating trench and laying water pipes, for the corporation.—Mr. J. Watson, waterworks engineer, Town Hall.

ARRINGTON.—April 15th.—For the erection of three pairs of cottages, for the rural district council.—Mr. S. G. Wilkinson, clerk, St. Neots.

ASHINGTON.—April 17th.—For the erection of gasworks, for the urban district council.—Messrs. W. A. Valon & Son, Caxton House, Westminster, S.W.

HALIFAX.—April 17th.—For the erection of a tramway waiting-room and tool-house, for the corporation.—Mr. J. Lord, borough engineer and surveyor.

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. APRIL 16, 1915. No. 1,213.

Minutes of Proceedings.

Rural Housing.

At a meeting of the Surveyors Institution held on March last the paper on the housing question was read, its recommendations being based on the report of the Land Enquiry Committee. The first of these papers was by Mr. E. Strachan Gardiner, and dealt with Rural Housing. It will be remembered that the committee recommended a substantial increase in such an increase in the wages of the rural labourer as would enable him to pay an economic rent. This increase is to be secured by the establishment by law of a minimum wage. The economic and political considerations involved in this proposal do not enter into the present question, and we shall therefore confine our remarks to certain general factors which go to show that some effective action must be taken by the Government as soon as possible after the passing of the present crisis. And first, as Mr. Gardiner pointed out, the general standard of living is rising steadily, and an element that is going to have its effect on the housing question is the influence of the great improvement in elementary education upon the children of the rising generation, who will not be content with the conditions which have satisfied their parents. It is generally admitted that as a result of their investigations the committee were able to make out a strong case for the immediate necessity of erecting a large additional number of rural cottages. Moreover, many existing cottages are in a very unsatisfactory condition, and their owners are not in a position to bear the cost of repair or reinstatement. Local authorities are thus not infrequently placed in a dilemma. If such cottages are closed under the Housing Acts, the displaced families are unable to find other accommodation, while the only alternative is to wink at the continued occupation of dwellings that are admittedly insanitary. In such cases Mr. Gardiner suggests that small owners might be assisted to put their houses in order by an extension of the Manchester Corporation practice, under which the work is carried out by the local authority, the owner repaying the amount expended by instalments with interest.

The report of the committee emphasises the necessity of stimulating local authorities to make more extended use of their powers under the Housing Acts. It appears, however, from the report of the Local Government Board on Housing and Town Planning in 1913-14 that something in the nature of a boom in house building by local [illegible] we find that in the last year for which statistics are available the number of local authorities who obtained sanctions to loans, the number of local authorities who obtained sanctions for the first time, and the amounts sanctioned all exceeded by about 100 per cent the numbers and amounts in any previous year since the passing of the Act of 1890. A good deal of this building, however, has taken place in urban areas, and the annual reports of the medical officers of health show that the conditions in many rural districts are still deplorable. The reason for this is to be found in the impossibility of carrying out a self-supporting scheme under existing conditions. If the wage of the labourer could be increased so as to enable him to pay an economic rent this difficulty would [illegible] present deficiency in cottage accommodation would speedily be made good. Mr. Gardiner further points out that as much accommodation as practicable should be provided, for if it is sufficient to enable a family to live together as long as possible they may be able to provide an economic rent from the combined income of the working members, where the earnings of the principal bread-winner would be inadequate to do so.

* * *

Urban Housing.

At the same meeting a very instructive paper on "Urban Housing" was read by Mr. C. S. Joseph. Mr. Joseph expressed general agreement with the conclusions of the Land Enquiry Committee as to the serious nature of the existing evils which have to be combated if the poorer classes of town dwellers are to be properly housed. In the first place there can be no doubt that a large proportion of the urban population of the country occupy overcrowded and insanitary dwellings owing to the scarcity of suitable accommodation at a reasonable rent. In the county of London alone over 250,000 persons live in one-room tenements, the number of such tenements occupied by more than two persons being considerably more than 30,000. From this it will be seen that the supply of dwellings, whether by public authorities, public utility societies, or private enterprise, is very much less than the demand, a fact which may be attributed to the high cost of land, especially in central areas, the incidence of rates, and the provisions of local by-laws. The precise effect of each of these three factors on the rent to be charged is matter for

debate. It is worthy of remark, however, that Mr. Joseph, who has a very large experience of the erection of block dwellings, expressed the opinion that the cost of land has not so important a bearing on the problem as is indicated in the report, and that it is quite feasible to pay 7s. 6d. per foot for a site upon which dwellings may be erected and yet obtain a fair return on the capital outlay. At this price the cost of land represents 1s. 1d. per week per tenement. The question of the rates is one to which sufficient importance is not always attached, particularly in view of the fact that the need for a large provision of good accommodation, letting at a low rent, is greatest in the poorer and overcrowded districts, which are, without exception, those which are burdened with the greatest need for public expenditure, resulting in the highest rate in the £. Moreover, there is a general tendency for rates to rise, so that they form a fluctuating charge, and as they cannot be met by an adjustment of capital, any increases must necessarily be directly reflected in higher rents, without regard to the ability of the tenants to pay.

Mr. Joseph summarised the remedies suggested in the report under four main heads. First, that as a result of a complete survey of their district a local authority shall prepare a scheme for the provision of the necessary housing accommodation, particularly for the population likely to be permanently resident within their area. And here we agree with Mr. Joseph that it is not in the lack of powers, but in the neglect to exercise them that the chief difficulty lies. He points out that a good deal of the hesitation on the part of local authorities to embark upon housing schemes is due to the fear that there may be a charge upon the rates; but profitable schemes have been carried out in London in the past, and might be even now if advantage be taken of the borrowing powers under the Housing of the Working Classes Act, 1914. The other remedies were concerned with transit to outlying districts, financial assistance to public utility societies, and the improvement of insanitary property. The last named is not in reality a remedy at all, but rather a temporary expedient which has the great disadvantage of increasing the life of really unsuitable houses, instead of utilising the land on which they stand to the best advantage.

Dry Closets: The Royal Commission's Recommendations.

Theoretical considerations may warrant the use of the earth-closet and the ashpit privy, but it is surely time that the many shortcomings of the system, advocated in the concluding pages of the Ninth Report of the Royal Commission on Sewage Disposal, were generally acknowledged. Those who have had many years of practical experience in the inspection of such appliances know only too well from the disgusting nature of their task how utterly inferior to the water-closet are such contrivances in practical working, and how absolutely certain it is that the earth-closet, even under the best conditions, will be neglected at times. In the poorer dwellings the case is bad enough owing to the difficulty of obtaining dry earth, to the need for continuous, unremitting care, and to many other causes. In the larger houses there may be one or two earth-closets which are kept in proper order, but in the servants' quarters or in the stables it will generally be found that the condition of affairs is horrible. Further, the chances of the spread of typhoid, in the event of the presence of a typhoid carrier, are not inconsiderable, particularly on dark, wet mornings when the process of emptying the buckets and digging the contents into the ground is apt to be hurried, and clothes and hands are practically certain to become contaminated. Such work may be done, say, by a cowman, who forthwith proceeds to milk cows. The process is not only objectionable, but it is generally accompanied by great nuisance and danger. Then again the futility of the process ought to be obvious. Of what use is it to dispose of the fæcal matter in this way if all the slop water, including urine, remains to be treated? Such water contains not only urine, but the foul waters from the kitchens, with fat and vegetable and animal refuse, the washings of dirty clothes and of the people themselves, the dirty water from floor washings, and many other foul matters. These constitute sewage, and cause trouble and pollution, and, futhermore, the addition of fæcal matter to such water renders it easier of treatment. Where a group of houses, or even a single house exists, some sort of treatment, which may often be extremely simple, is necessary.

Dealt with by a competent engineer, the matter is not one of great difficulty, even with a limited water supply, and the Royal Commission might have found many instances of such successful treatment. It is therefore a matter of surprise and regret to find that they state that where the water supply is inadequate "a system of dry closets may be open to little objection," and that "in small communities the removal of the contents may generally be left to the householder," while "in larger villages it may with advantage be undertaken by the local authority." The privy midden, we are told, "may be much improved," and its use is apparently approved if ashes are "applied to the excretion in order to mitigate the offensiveness." It is almost impossible to believe that the suggestion of a large village, in which each house is provided with a privy midden or ashpit, or with an earth-closet, is approved by the Royal Commission. The idea seems to be entirely retrograde, and it is to be doubted if the engineers of the Local Government Board will ever approve such a recommendation in actual practice. It would be of general interest if those of our readers whose experience extends to the extensive use of earth-closets or of privy ashpits would contribute their opinions on this very important matter.

* * *

The Roads Improvement Association.

Among the various functions of the Roads Improvement Association, not the least important is that of acting as a means of communication between road users and those authorities and engineers who are responsible for the maintenance of the highways. It is satisfactory therefore to find that a prominent place is given in the recently published annual report for 1914-15 to the two conferences with surveyors which were held during the year. It will be remembered that the first of these gatherings took place at the Royal Automobile Club, when Sir George Gibb was the guest of the evening, and that at the second, which was held at Leicester, Mr. H. Percy Boulnois, M.Inst.C.E., opened a discussion on "Modern Road Methods." Both conferences were very successful, and it is intended in more normal times to hold others with a view to provide further opportunities of collaboration between road users and highway engineers. The report deals with many other matters of interest, and although the activities of the association have been necessarily somewhat restricted since the outbreak of war, the year under review has witnessed the accomplishment of much useful work. For example, the proposal contained in the Great West Road Bill, promoted by the Middlesex County Council, that motor omnibuses should make a direct payment for the use of the new road, was strenuously opposed in the House of Lords, and although the opposition

was not successful, it was the means of placing before Parliament the views of the association upon a question of principle as to which there has been much difference of opinion. Another matter upon which the association is deserving of congratulation is the announcement by the Chancellor of the Exchequer last year of the adoption by the Government of the principle of state grants in aid of the expenses of maintenance of main and county roads, in accordance with the recommendations contained in the final report of the Departmental Committee on Local Taxation. The Roads Improvement Association has been persistent in its advocacy of such a policy, and the new departure indicated by the Chancellor of the Exchequer marks the successful issue of the campaign.

Before leaving the subject, reference must be made to the Horse Shoe Competition organised by the association in conjunction with the Royal Society for the Prevention of Cruelty to Animals. In writing of this competition some time ago we pointed out that the success of a bituminous road surface depends largely upon its power to resist the penetration of water, and in order that this power may be retained it is important that the surface shall remain smooth and unbroken. Smooth surfaces, however, are not suited to the ordinary types of horse shoe, and lead to the use of calkins or other projections which damage the roads and render them no longer waterproof. Hence the competition, the results of which, however, were on the whole disappointing, inasmuch as no shoe or device entered was of sufficient merit to warrant the award of the first prize of £100. Moreover, neither of the first two of the smaller premiums awarded was based upon any new idea, the appliance in each case consisting of an improved method of adapting an old device. In addition to the general work of the association many local improvements, an interesting summary of which is included in the report, have been effected as a result of the efforts of the several branches.

* * *

The Nottingham Slum Clearances.

Nottingham Corporation have this week decided to proceed with the fulfilment of the Carter-gate and Manvers-street improvement scheme, concerning the desirability of which there has been more than ample discussion. This, one of the final stages of the matter, was not allowed to pass without a protest from a minority of members who, no doubt from the most conscientious motives, sought to prove that the site of the scheme was ill chosen, that it was needlessly costly, and that a great deal of expense would have to be incurred under the compulsory conditions of rehousing that are imposed upon the town council by the Local Government Board. This is the kind of opposition with which we are familiarised by people who, perhaps unconsciously, or because pecuniary interests are involved, are disposed to exaggerate the rights of proprietorship, and at the same time to overlook, or at all events under-estimate, the larger issues of public health and municipal progress. To seek to magnify the mere material and monetary aspects of the subject is to pay a poor compliment to the ideals underlying our housing legislation, or to professional men, architects, municipal surveyors, and sanitary engineers in their efforts to give practical effect to these ideals. Fortunately, the principal local paper of Nottingham, the *Guardian*, leaves no room for doubt as to the side it takes with respect to this particular phase of the matter. Writing on the decision of the town council, it says: "There is room for difference of opinion as to the type of house that is needed, and on this point the opinion of Councillor Goddard, who is opposed to the plans of the Housing Committee, ought to carry weight. But in reference to the need for clearing such areas as Carter-gate there need be no further discussion. The conscience of the nation demands that men and women and children shall not be housed in places not fit for dog-kennels, and the owners of such houses, instead of whining about their losses, may be thankful that [illegible] ."

* * *

Fire Tests with Automatic Sprinklers.

The British Fire Prevention Committee have issued as Report No. 199 a record of a series of tests with an automatic sprinkler submitted by a Philadelphia firm of manufacturers. The series of tests, which were far more elaborate than usual, dealt with the sensitiveness of the sprinkler heads, their reliability, distribution, flow of water, strength and durability, the scientific tests being supplemented by actual fire tests to show the range of efficiency. The British Fire Prevention Committee has not been testing sprinkler heads for some ten years, and the methods adopted are an improvement upon their earlier form, one of the advantages being that there is now made available a considerable amount of technical detail that was previously only known to a limited few.

It may be anticipated that, while the series of tests reported upon deals with one specific American appliance, the committee may, on the termination of the war, undertake a similar series with all the sprinklers at present on the market, and this would be a material advantage to the technical as also to the insurance profession, and lift the veil of a certain amount of secretiveness regarding relative utility and limitations of the various rules of this very useful class of automatic fire appliance. One of the most interesting features of the report is a novel form of comparing the amount of water distributed by the actual sprinklers under test with what should have been distributed if the action of the sprinkler head could be made ideally regular.

* * *

Municipal Employees and the War.

In the *Birmingham Daily Post* for Saturday last there appeared a statement by the Lord Mayor respecting the arrangements which have been made for the release of corporation workmen for service in armament factories. From this it appears that a representative of the Local Government Board had waited upon the Lord Mayor to urge the desirability of the corporation releasing as many of their workmen as possible for employment by the Government in the manufacture of munitions and other materials required for the prosecution of the war. As a result, it has been found possible to release no fewer than 1,062 men for such service, and although this necessarily involves a good deal of inconvenience, it is anticipated that the citizens will give their loyal approval to the action that has been taken. We understand that a similar visit has been made to the offices of the Surbiton Urban District Council, where a complete list of workmen was submitted, together with their ages and the class of work on which they are engaged. From this list a certain number were selected, and it was understood that they would shortly receive communications from the War Office with a view to their being drafted, with their consent, to some work in connection with the manufacture of munitions of war. Both at Birmingham and Surbiton the positions of the men drafted into Government service are to be kept open. There can be little doubt that other local authorities will be similarly approached in the very near future.

A Cape Town Bathing Pavilion.

By A. N. HENDERSON, assoc.m.inst.c.e.

Pleasantly situated on the outskirts of Cape Town, Sea Point, besides being a favourite residential suburb, is deservedly popular as a holiday resort for visitors from all parts of the Union of South Africa, and even from Europe. One of the chief recreations of residents and visitors alike, during the warm summer months is bathing, the southerly Antarctic current rendering the sea beautifully cool and refreshing even on the hottest day. As the coast-line is, to a large extent, rocky, and subject to the very heavy rollers from the open sea, it has been necessary to construct artificial pools to allow of bathing being indulged in in safety. Several of these are dotted along the foreshore, but it became obvious that, owing to the increased influx of visitors, something on a larger scale would have to be erected if Sea Point was to retain its popularity.

The Municipality of Green and Sea Point, now merged in the Municipality of Greater Cape Town, therefore decided in 1912 to construct a pool and a pavilion which would serve the needs of the district for some time to come. After careful consideration the conclusion was come to that reinforced concrete on the Kahn system was the most suitable material of which to construct the pavilion, and the following is a brief description of the work now completed.

The building was erected in conjunction with a large swimming pool, 250 ft. by 180 ft. by 6 ft. maximum depth, formed out of the rocky foreshore, with a heavy mass concrete sea-wall to seaward. It consists of a ground floor, slightly below road level, on which are situated 130 cubicles for male bathers and 120 for female bathers, shower and slipper baths, lavatories, attendants' rooms, and two large club-rooms. A balcony 8 ft. wide extends along the entire sea-face of the building at ground floor level. The shore below ground floor and balcony is covered several feet deep with sand, and forms an extensive shelter from the sun, and a children's playground. Above the ground floor is a promenade-roof with two shelters, one of which is used as a bandstand, and over the centre part of which a large refreshment room has been constructed. There are semi-circular balconettes at intervals on the roof, cantilevered out over the balcony below. In plan the building is "U" shaped, with an overall length of about 250 ft., and two wings 71 ft. long; the width throughout is 33 ft.

The main columns are spaced at about 16 ft. centres transversely, and longitudinally the centres vary from 21 ft. 6 in. downwards. They are 16 in. square throughout, which gives an ample allowance in the case of another story being added. The balcony columns are 10 in. square, and all columns were taken down to rock. At the sea end of the wings, where they are most subject to wave action, the columns are braced. There is a retaining wall below the ground floor and down to rock along the land side of the building. It is 11 ft. 6 in. high by 7 in. thick, and of vertical slab design.

Bathing Pavilion and Swimming Pool, Sea Point, Cape Town.

The longitudinal main beams are 18 in. deep below the floor, by 10 in. wide, and the secondary transverse beams are all 12 in. deep by 7 in. wide at about 6-ft. centres.

Two contraction joints were formed in the length of the building, thus dividing it up into three portions; but although these seem to act quite satisfactorily, the very trying conditions experienced in this part of the world appear to require more allowance for contraction, as cracks have not been entirely obviated.

The promenade portion of the roof has been covered with asphalt. The walls are of reinforced concrete throughout, 4 in. thick. They were rubbed down with a hardwood rubber on the removal of the centering, but otherwise are as the shuttering left them. All mouldings were formed in the shuttering. Copings and parapet, except where the latter was of open construction, were formed in situ.

There are two reinforced concrete stairways from ground floor to promenade. A reinforced concrete footbridge has been constructed over the railway line in front of the pavilion to serve as the main approach. The bridge was originally constructed as a single span of 20 ft. clear, with stairs at either

end. It was subsequently decided to add another span of 25 ft., so that vessels could be cleared close to the promenade pier. At each end of the 25-ft. span there are short cantilevered projections, and the main slab has been cantilevered out on each

The accompanying illustrations show what an attraction the new pavilion offers to visitors at Sea Point.

Main Roads Past and Present, and Modern Methods of Construction and Maintenance.*

By FRANK GROVE, M.Inst.M. and C.E., Assistant County Surveyor of Surrey.

The difficulties of satisfactory road construction and maintenance in this country have in recent years reached a very acute stage, which has been brought home with much force to all road engineers and others interested in the work, and in a particularly unpleasant form to the ratepayer who has been called upon to meet the increased cost, the extent of which has caused him no little alarm. This paper gives an outline of the inception and development of the road system in this country, and indicates in detail some modern attempts to cope with traffic ever increasing in weight and numbers.

History of Roads in England from Roman Times.

We are told by various writers that the Romans, the greatest road makers of ancient times, were noted for the excellence of their roads, which were laid out in straight lines from point to point, often regardless of obstacles which might have been avoided, and have never been excelled in solidity of construction. Their general straightness may perhaps have been due to convenience in setting out or to their being laid out in a line with some prominent landmark. Some of them still remain, forming the foundation of more modern roads. Their general method of construction consisted of a foundation of one or several courses of flat stones laid in mortar, with a surface of pavement blocks laid on concrete and jointed with mortar, and were often 3 ft. or more in thickness. For the small amount of traffic they had to carry their construction would seem to have been unnecessarily substantial. The usual width of the paved portion of the road was about 14 ft., with unpaved ways on both sides about half the width of the paved road, and separated from it by raised stone edgings. The surface was sometimes made of hard concrete, pebbles, or flints set in mortar, and sometimes in clay and marl. Where inferior materials were used the surface of the road was made higher and rounder in cross-section.

The Roman roads remained in use down to the Middle Ages, but no regular provision was made for their maintenance, and they gradually fell into disuse. The materials used for their construction were pillaged for building material, and they were in parts ploughed up so that they are now mostly unidentifiable. Although there are no traces of Roman influence in the later roads in England, which are generally more or less tortuous, their straightness appears to have been copied to some extent in France about the beginning of the eighteenth century, when new roads, known as "Routes Nationales" and "Routes Départementales," were constructed by the Government of that country.

During the Middle Ages there was practically no vehicular traffic, and comparatively few new roads were constructed. Those that were made fell far short of the Roman standard, and for the most part cannot now be traced. They were practically dependent upon charitable bequests for their repair, and these bequests, although usual upon specified roads, were sometimes made for the repair of unspecified roads, and generally took the form of gravel or other material for repairs. Guilds largely contributed to the maintenance of the roads, and monasteries and the clergy also assisted.

Many ways were constructed during the Saxon and Norman periods, the most interesting of which were those by which pilgrims travelled to the various shrines throughout the country, traces of which still remain. In Tudor and Stuart times highways, holloways, causeways, and other ways were made, and took their names from their method of construction, which was very primitive, while they were narrow, and, as a whole, badly kept.

In the fourteenth century vehicular traffic was not unknown, but it did not become general until the middle of the sixteenth century, when public road vehicles were first introduced. The roads at that time, however, were most unsuitable for such traffic. Before the end of the sixteenth century coaches became the general means of conveyance among the wealthy classes, and stage coaches appear to have been introduced towards the middle of the seventeenth century. At first there was a great outcry against their introduction, and it was some time before the old method of personal conveyance by saddle-horse became obsolete, and stage wagons were substituted for pack-horses.

At the beginning of the seventeenth century, owing to the increased use of vehicles, the Legislature had to choose between adapting the roads to wheeled traffic or adapting wheeled traffic to the roads. It chose the latter course, with the result that numberless Acts of Parliament were passed restricting the number of horses to be used in carts and wagons, the weights to be carried, and the widths of wheels. The greater the width of tyre the less toll had to be paid, the theory being that broad wheels tended to preserve and consolidate the roads, whereas narrow ones cut them up, thereby increasing the cost of their upkeep. Each parish had to maintain its own roads by statute labour, and this no doubt accounted largely for their bad condition. The road problem was eventually solved by adapting the roads to the traffic by the passing of the Highway Act of 1835 (referred to later), which at one sweep removed most of the restrictions on traffic.

Down to the middle of the eighteenth century the roads then existing were hardly worthy of the name, and were for the most part hilly and tortuous tracks, because low-lying ground was never crossed if it could be avoided. Local taxation was the sole method of raising money for absolutely necessary repairs, and no doubt the standard was a low one. The establishment by law of numerous turnpike trusts, peculiar to this country, enabled gates or barriers to be set up, and tolls levied upon the persons using the roads, the money thus obtained being utilised in their maintenance and improvement. The system was cumbrous, and the persons appointed to administer the tolls so incompetent, that very little improvement was effected. The turnpike trusts added largely to the number of hilly roads, and no attempt was made to obtain expert advice or skilled labour in the execution of the necessary repairs. Such materials as could be most readily obtained were heaped upon the middle of the roads without any attempt being made to consolidate them. The roads thus became so convex that the only safe place for the traffic was along the centre of the road, and the wheels of vehicles pressing against the sides of the roads caused deep ruts, and pushed the materials into the ditches.

This state of affairs existed until the beginning of the nineteenth century, when Telford and Macadam directed their attention to the construction of roads and brought scientific principles and regular system to bear upon their construction and repair. Their methods were very similar, including thorough drainage, the use of properly broken stone, and the adoption of a uniform cross-section of moderate curvature. Angular broken stone was spread evenly over the surface and finer material sprinkled thereon, so that the traffic passing over the road would consolidate the material and form a hard, smooth surface. Telford paid particular attention to the foundation, and his name is associated with a pitched foundation, which he did not always use, and which closely resembled that which had long been in use in France. Macadam, however, disregarded it, contending that the subsoil, however bad, would carry any weight if made dry by drainage, and kept dry by an impervious covering. Macadam was chiefly engaged on the repair of old roads, and the improvement which he effected in road management and maintenance was great and lasting. His method of repairing roads became general, and with the addition of the use of a roller to consolidate the material is still chiefly employed on the majority of roads in this country to-day. The process of rolling the newly laid material appears to have been adopted about the year 1830, but it was some years later before the practice became general, chiefly because of the expense entailed. The steam roller made its appearance about the year 1863, and in the first instance was an adaptation of a form of traction engine.

In 1835 an Act of Parliament was passed to consolidate and amend the laws relating to highways in England. This placed the burden of upkeep of the

* Paper read at a Meeting of the Society of Engineers on Tuesday.

roads on each parish and gave Justices of Quarter Sessions power to unite parishes into districts. This Act related to the appointment of surveyors of highways and boards of management, and authorised the erection of guide stones and posts at cross-roads and other places. The surveyor was empowered to make, assess and levy a rate in order to carry out the purposes of the Act. Much of this Act is still in force, and forms the basis of highway law in many respects at the present day.

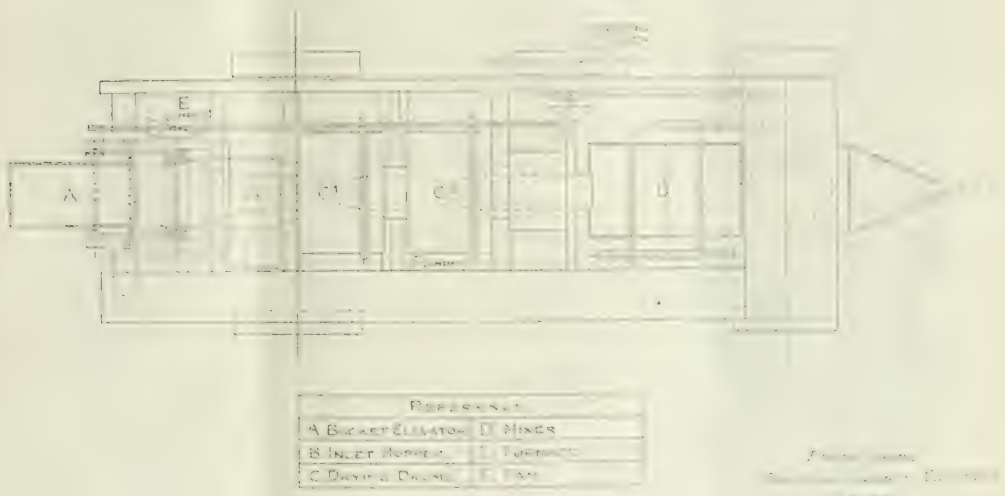
With the great development of railways in the Victorian era the traffic temporarily left the roads, and this resulted in their neglect, although strenuous efforts appear to have been made during the last days of coaching to improve the roads in order to keep the traffic upon them. The turnpike trusts had by this time become heavily in debt owing to a large decrease in tolls, but in spite of this they struggled on for a considerable period, and it was not until the Highways and Locomotives (Amendment) Act of 1878 was passed that their fate was eventually sealed. This Act gave the county authority power to enforce the repair of roads, and stipulated that all roads disturnpiked after 1870 should become main roads, half the expense of maintenance being thrown upon the county rate. This Act also empowered the county

tary scavenging necessary for the convenience of the inhabitants.

TRAFFIC [illegible] IMMEDIATELY PRIOR TO THE INTRODUCTION OF MOTOR VEHICLES AND DETAILS OF ROAD CONSTRUCTION AT THAT TIME

Towards the end of the nineteenth century, and just prior to the introduction of the self-propelled vehicle, a general improvement of the main roads had been effected. This was no doubt in a great measure due to the general improvement of the means of transport, both as regards passengers and merchandise, and also to the increased popularity of cycling, which had then reached its zenith. The spreading of the cost of maintenance over a larger area, and the more skilled supervision provided by the county councils, also tended to a more uniform and better standard of maintenance. The surface of the Surrey roads consisted mainly of local gravel, flint and other local stone, of which there was an abundant supply within the borders of the county, but the majority of the roads were sadly lacking in good foundations. The latter was mainly an aggregation of gravel and other local materials used from time to time in the various coatings and laid upon the natural subsoil. The traffic, however, on some

SKETCH PLAN OF [illegible] ARRANGEMENT OF DRYING AND MIXING PLANT
¾" SCALE



authority to declare ordinary highways to be main roads.

Since April 1, 1889, the appointed day referred to in the Local Government Act of 1888, main roads have, in general, been wholly maintained and repaired by the county council. Urban authorities, however, were offered the option of "claiming" to retain the control of the main roads in their districts, the county council making an annual payment in respect thereof. This Act also enabled the county council, if so disposed, to delegate the control of the main roads in "unclaimed" districts to local highway authorities, making an annual payment out of the county rate towards the maintenance, repair, and reasonable improvement of same. Some county councils adopt the system of direct management for the main roads while others adhere to maintenance through the local authorities, and opinions differ as to which is the better method. In the county of Surrey, where the author's experience covers a period of nineteen years, a dual system is in existence, although only a small mileage is directly maintained. This is no doubt very largely because the county bordering on the Metropolis consists for the most part of urban districts where direct management would be difficult, inasmuch as the county council is liable only for such scavenging as is necessary for maintenance, while the local authority is responsible for any sani-

of the more important trunk roads had grown to such an enormous extent that it had become necessary to substitute a tougher material for the flint and local stone formerly used. This necessitated the use of various kinds of granite, basalt, limestone, &c., all of which had to be imported into the county from the Midland and Western Counties and from abroad, and consequently added very considerably to the cost of upkeep.

The principle of repairing the roads at that time was entirely that of the water-bound macadam method. The surface of the portion of road to be repaired was first loosened either by means of hand-picking or of a scarifier attached to a steam roller. The loosened material was then carefully raked until a regular camber with a fall of 1 in. in 2 ft. from the centre to both sides was obtained. In low-lying and damp places a little more fall was given, and in dry open places and on hills a little less. Any depressions or soft places were made up with new metal, usually large unbroken flints. The new material, carefully broken to a gauge of about 2 in., was then, under the superintendence of a competent spreader, evenly spread over the whole width of the carriageway to a depth of about 3 in. or more and rolled dry without crushing the material, after which binding material, such as clean sand, fine gravel, hoggin, or sometimes road sweepings, was sprinkled

thinly upon the partially rolled surface. Water was then applied and the surface again rolled. Labourers were then employed to sweep the surface until the resultant slurry completely filled all the interstices between the stones and the new metal became thoroughly consolidated. The usual weight of the roller used was about 10 tons. It was found that the surface of a flint road, if properly attended to, continued to improve under traffic for some time after the metalling had been applied, whereas the surface of a granite road quickly became uneven and steadily deteriorated from the day the steam roller left it. To obtain a more even surface, granite of a smaller gauge than 2 in. was tried, but this smaller gauge was used only after a sufficient crust had been formed by the use of granite of a larger gauge. The autumn or the early winter months was considered the best time of the year to carry out the repairs, as depressions and soft places could be more readily detected when the roads were in a wet state, besides which the surface could be more easily scored and the new material more readily worked into the old. The materials for the annual repairs, which were, as far as possible, obtained, carted, and, in the case of flints, broken during the summer months when the roads were hard, were deposited in depots by the side of the road nearest to the point where the material was to be applied. Wherever possible the repairs were executed in long lengths in preference to patching, which is never a very satisfactory method of repairing roads.

The roads were divided into lengths of from 2 to 5 miles, and permanent roadmen, called "lengthmen," were employed throughout the year to scrape and sweep the surface, and the road sweepings, after being collected at the sides, were removed as soon as possible, or distributed over the roadside wastes. Small quantities of patching material were stored in depots at convenient intervals, so that in case of hollows and weak places appearing they could be quickly filled up and attended to by the lengthmen before further damage was done. During periods of long drought the surface, more especially in urban districts, was watered to prevent it breaking up and being worn to dust under the constant traffic. Flint roads break up more quickly than granite under continuous and heavy traffic in dry weather, but whereas watering or damp weather improves a flint road, continuous rain or the constant flooding of a granite road by excessive watering does more harm than good. The water collects in the depressions or "potholes," and renders them softer, so that wheeled traffic increases their depth, and if not quickly attended to a very uneven and bumpy surface is the result. Frosts and extraordinary traffic also contribute largely to the break-up, while trenches for sewers, gas, water, and other mains damage the roads extensively, and can almost invariably be traced for a long period, sometimes years, after they have been filled in, however carefully this may be done. During the spring and summer months the lengthmen are employed in keeping the side channels clear of weeds, cleaning out the ditches and grips, trimming verges, breaking flints, &c.

During the period under review very little road construction was carried out owing to the very complete network of highways in existence. Where, however, it became necessary to provide new foundations, the material usually employed was hardcore consisting of old concrete or brick rubble.

The thickness depended upon the nature of the subsoil, 6 in. being considered sufficient on chalk or gravel, increasing to 12 in. on clay and wet soils, with 3 in. of ashes on the bottom to prevent the clay squeezing up into the hardcore during consolidation.

The finishing coat consisted of gravel or flints 6 in. thick, laid and consolidated in two separate thicknesses, the material for the bottom layer being of a larger gauge than the top coat.

Effects of Motor Traffic on the Old Type of Roads, and Methods Employed to Cope Therewith.

Just before the dawn of the present century the lighter form of self-propelled vehicle, which had become legalised by the Motor Car Act of 1896, made its appearance, and although at first the growth of this class of traffic was slow, it was not long before its presence was forcibly felt. Cycling had begun to wane, but this was more than compensated for by the rapid and unparalleled improvement in the transport of passengers and goods, which not only brought about a change in our highway system, but also robbed the railways of a monopoly which they had enjoyed for a number of years. It soon became necessary to permit an increase in the speed of motor cars from 12 to 20 miles an hour, which was done by the passing of the Motor Car Act, 1903. This also gave the Local Government Board power, on the application of the local authority, to reduce the speed to 10 miles an hour on certain specified lengths of highway, and authorised the erection of signposts to denote dangerous corners, cross-roads and precipitous places with a view to the safety of the public.

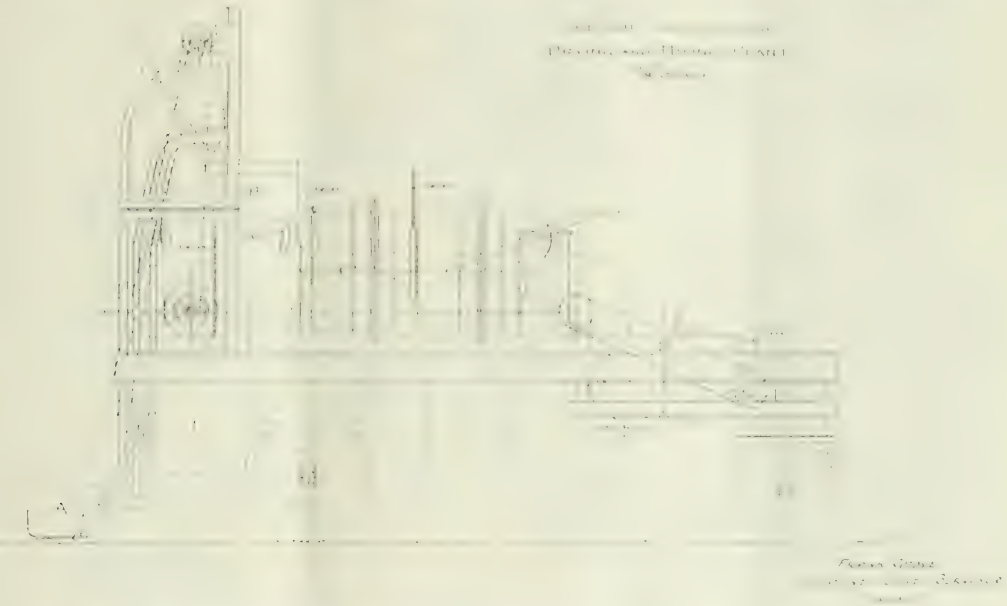
Traction engine and other traffic had also increased very considerably, the use of the former being no doubt greatly extended in consequence of the rates of freightage by railway remaining very high, and as a result of mechanical road traction becoming cheaper than horse traction, a certain amount of which was displaced from the roads. Following in the wake of the automobile for personal conveyance came the light motor vans for the delivery of goods, and also the heavy motor car or lorry with its accompanying trailer attached. These were made legal by the Heavy Motor Car Order of 1904, which arose out of the Act of 1903.

It was not long before the roads as then constructed were found to be entirely unsuitable for this class of traffic. Many long lengths of flint roads where the traffic was heaviest were converted into granite roads, while numerous bridges had also to be strengthened, and in many cases entirely rebuilt, to make them sufficiently strong. The repair of the roads in half widths became a necessity to prevent horsed vehicles carrying heavy weights and motor cars with soft tyres being compelled to pass over lengths of unrolled metal, although the repairs could more easily and efficiently be executed if the whole width were coated from side to side. The rapid growth in the number of motor cars and pleasure vehicles using the roads, especially at week-ends, did considerable damage to the flint roads in consequence of the sucking action of the rubber tyres drawing the small metal to the surface and the ordinary traffic converting it into a layer of sharp fine grit, while at the same time the large metal below became loosened. On macadamised roads small hollows and depressions were also quickly formed. It was no uncommon sight to see a good and apparently sound road after a fine week-end very badly damaged and tracked, rendering constant attention necessary. Motor traffic was also responsible for the numerous complaints received of the nuisance caused by dust and the bad condition of the surface. The dust nuisance became so acute that house property abutting on the principal thoroughfares depreciated to a very appreciable extent—in some instances as much as 20 to 25 per cent—in letting value, while large numbers of houses became empty from the same cause. The enjoyment of the roads by pedestrians, cyclists and others, more especially along lengths of road having no footpath, was greatly interfered with, and ratepayers complained that large sums of money were being spent in maintaining the roads for foreign motor traffic to use and destroy. Traffic statistics taken at the time showed that the main roads in Surrey were more used by motor cars than in any other county around London. In no county had the growth of traffic been more marked or its destructive effects more felt.

The problem of dealing with the dust nuisance and at the same time decreasing the damage done to the surface in order to preserve for the public the use and enjoyment of the highway to which they were entitled was very pressing and difficult, inasmuch as it had become necessary to make the roads strong enough to carry traction engines and heavy motor cars, and at the same time [illegible] for the motor car traffic and owners. It was recognised that, given roads of certain materials and construction, such as granite setts and [illegible] the dust nuisance would disappear, but the cost of such roads was quite beyond the [illegible] ratepayers.

With a view to mitigating or preventing the dust experiments were made with various materials to [illegible] and tars, and in the hope of eventually finding a material the cost of which, spread over a few years, would not greatly increase the cost of maintenance. Limestone and slag of various gauges, dried, heated and mixed with tar or other bituminous mixtures before consolidation, and tar applied [illegible] upon surfaces from which the [illegible] had been excavated and removed were tried, while several lengths of road surface were also treated with tar in various forms. Other lengths were sprinkled with water to which had been added certain proportions

of various kinds of chemicals. The results of these dust-preventing experiments were not wholly satisfactory. The tarred limestone and slag were both found to be very suitable upon roads where the traffic was more or less light, but upon roads with a very heavy traffic the tarred slag was infinitely better than the limestone, becoming too compact upon consolidation to be affected by the sucking action of motor cars. The surface, however, after slight rain was found to be somewhat slippery for horse traffic. Spraying the surface with tar was very successful, but the experiments proved that the weather had a considerable bearing upon the results obtained. When portions of the surface of the road were swept hard to remove all dirt and dust until the metal was exposed and the hot crude or distilled tar was poured on and well brushed in, and then being left sufficiently long to admit of the tar penetrating into the road as far as possible the surface was sprinkled or dusted with sand. When first laid and before being blinded the tar was found to lick up and adhere to the pairs' boots, causing damage thereto; while during bad weather in the autumn it churned up under heavy traffic. The various chemicals and liquids tried were certainly found to be [illegible]



dust, but in no case was the success achieved of sufficient magnitude to justify a continuance of their use to any very large extent or for any length of time. The experiments, however, proved conclusively that if properly executed, under favourable conditions, tarring the surface effectually and economically prevented dust, and upon open and wind-swept lengths preserved the surface and prolonged the life of a road. It is interesting to note that one length of road laid with tarred slag in 1905, upon one of the most heavily trafficked roads leading out of the Metropolis, has never since required entire renewal. It has, however, required patching, and it has been surface-tarred annually.

Although for the first few years the county council, in common with other county councils, only contributed (usually one-half) towards the cost of laying dust-preventing materials on "unclaimed" main roads, nearly all the districts availed themselves of the offer, and the remainder of the cost was either borne by the local authorities or contributed locally. The result was that tarring the surface gradually became fairly general. A curious point, however, arose as to the legality of a district council contributing towards the cost of tarring upon main roads in their district which were vested in the county council, but upon being approached the Local Government Board ruled "that the contribution would be quite in order if it could be shown that the operation was of such a character as to constitute an improvement within the meaning of sec. 3 of the Highways and Bridges Act, 1891."

This form of road maintenance was largely increased, with the result that it was found in practice that surface tarring, besides mitigating the dust nuisance, effectually prevented tracking and disintegration, while a great deal of watering, with its accompanying ill-effects, was avoided. This led to the county council raising their contribution to two-thirds of the cost through towns and villages where tarring was undertaken partly for the purpose of dust-laying for the convenience of the inhabitants, and paying the whole cost on open and uninhabited roads where the preservation of the surface was the primary object. Eventually the county council decided to pay the whole cost of surface tarring, and, with the exception of those roads upon which more permanent surfacings have become imperative on account of the enormous traffic, almost the whole of the roads in the county are now treated at least once and in many instances twice every year. The durability of the treatment varies considerably, according to the situation of the road and the extent of the traffic. Hand appli-

cation is that usually employed, but various machines are now upon the market to which sprayers and brushes are attached, and these enable the tarring to be carried out much more expeditiously, which is a great advantage in our variable climate. Compounds containing ingredients other than tar are also extensively used, and in some cases are more effective and durable than either crude or refined tar, but the initial cost is, of course, higher. Granite chippings are also substituted for the sand used for binding purposes, which adds to the cost of the work. The waterproofing of the surface of roads, however, leads to a consequent reduction in the scraping and sweeping hitherto necessary, and this saving should be set off against the cost of the tarring.

MODERN METHODS OF CONSTRUCTION AND MAINTENANCE.

In reviewing the latest developments introduced to meet modern traffic requirements it will be the author's endeavour to give as briefly as possible a description of some of the well-known methods which have been adopted in Surrey, and to give comparative figures of cost. It should, however, be borne in mind that the figures quoted are from actual experience when prices of materials were normal before the outbreak of the war.

Water-bound Macadam.—The method of coating roads with granite, basalt, or other tough material, water-bound and surface-tarred, is very suitable for roads with a moderately light traffic, and is that still generally adopted. The selection of the material to be used requires great care, and regard must be had to the quantity and weight of the traffic using the road. The manner in which the material is applied has been previously described, except that the early Spring is now considered the best time for carrying out the repairs. About 9 yds. super. is covered with a cube yard of material, and with chippings or sand used for binding, the cost works out at about 1s. 6d. per yard super. New coats should be surface-tarred as soon as the road has dried sufficiently, and another dressing given in the autumn before the break-up of the fine weather. The cost of tarring, which varies according to the quality of the tar and the kind of material used for blinding purposes, works out at from 1½d. to 2d. per yard super. The covering capacity of a gallon of tar averages between 5 yds. and 6 yds. super., and 1 ton of grit covers from 200 to 250 yds. super. The life of such a road may be generally accepted as from three to five years or more, but varies according to the traffic and other conditions prevailing. After the first year an annual tar-dressing is very beneficial, the surface being thus maintained waterproof, and consequently withstanding the effects of traffic and weather very much better. Until recent years the final consolidation of the metal was effected by the passage of horse-drawn iron-tyred vehicles, but this kind of traffic has of late been so materially displaced by self-propelled vehicles, which now form by far the larger percentage of the traffic, that such consolidation has become quite impossible, the material being pushed into ridges and leaving a very uneven surface at completion. Upon roads bearing heavy traffic the benefit accruing from surface-tarring is comparatively small, and a more substantial waterproofing method is necessary to preserve the surface for any length of time.

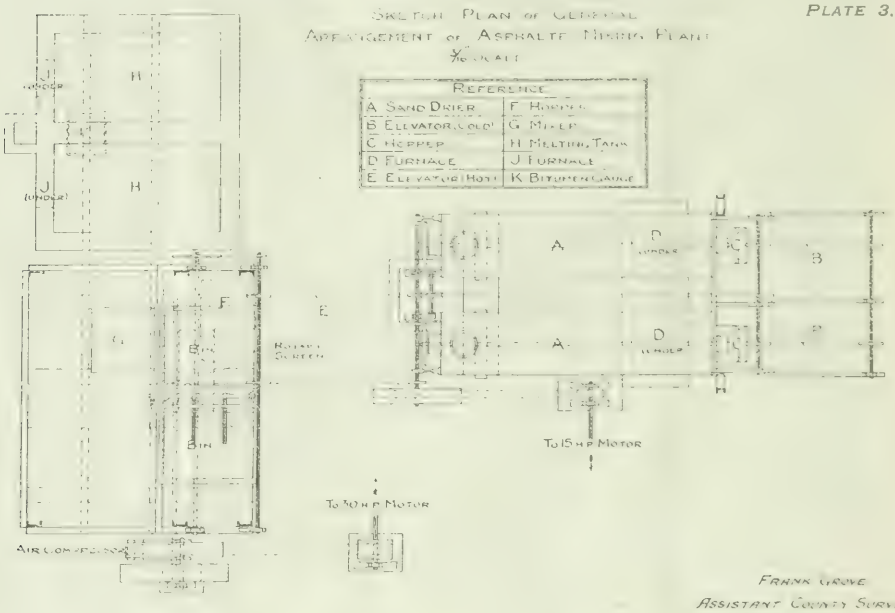
Tar-macadam.—On the roads with moderate traffic this material has been largely substituted for the water-bound method. Before applying this material the existing surface is scarified, formed to a proper cross-fall, and rolled. The most suitable aggregate is selected blast furnace slag, thoroughly dried, heated and coated with distilled tar or tar compound. It is usually made in three gauges—viz., 2½-in. (from 2½-in. to 1½-in.), 1½-in. (from 1½-in. to ½-in.), and ¾-in. (from ¾-in. to ⅛-in.). In two-coat work, which has a finished thickness of about 4 in. after consolidation, 2½-in. material is used for the bottom layer and 1½-in. for the top. Each layer is rolled separately with a roller of about 8 to 10 tons in weight, but before the top layer is thoroughly consolidated just sufficient ¾-in. material is sprinkled on the surface to fill up all the interstices and rolled so as to form a perfectly waterproof surface. The percentage of the various grades used are, approximately, 60 per cent of large, 35 per cent of medium, and 5 per cent of fine material, but these quantities may be varied to suit the requirements. In the case of one-coat work with a finished thickness of about 3 in., material of mixed gauge graded from 2½-in. down to ¾-in. or ½-in., is used, with a sprinkling of topping material as before. After being subjected to traffic for a month or two, and when perfectly dry, the surface should be dressed with tar and chippings so as to fill up all voids completely, and to form a waterproof and durable wearing surface. One ton of material will surface about 8 yds. super. 3 in. thick, and the cost is from 3s. to 3s. 6d. per yard super., according to the cost of material and the difficulties of laying owing to the previous state of the road and amount of interruption by traffic. A tar-macadam road will, with care in patching and annual surface dressings, last from five to eight years or even longer, according to the amount of traffic, after which it can be re-topped, or, if found advisable, used as a base coat for a more permanent form of bituminous surfacing. Slag tar-macadam is very suitable for roads with a great deal of motor traffic. Compared with water-bound granite, the initial cost is about double, but there is a saving in the annual cost of cleaning, patching, &c., and where it is found that water-bound macadam will not last longer than three years, it is undoubtedly more economical to substitute tar-macadam.

Limestone tar-macadam is also largely used in the same manner, but it is only suitable for roads with a light motor traffic, and where the situation is well exposed to quick-drying influences.

Granite tar-macadam has also been tried with but very few satisfactory results. The aggregate does not appear to be sufficiently porous or the surface sufficiently rough to retain the compound, the result being that under heavy traffic the material loosens and the surface becomes uneven. It does not seem practicable to keep a waterproof surface through the winter where the traffic is considerable, so it would appear to be only suitable for light traffic in exposed situations.

Pitch-grouted Macadam.—This can be laid in single or double coatings, according to the requirements of the traffic. In single pitch-grouting the existing surface of the road is scarified, and the excavated material, after being sifted to remove all stones below 1 in., is re-spread together with sufficient new granite or other suitable material of about 1½-in. gauge, and

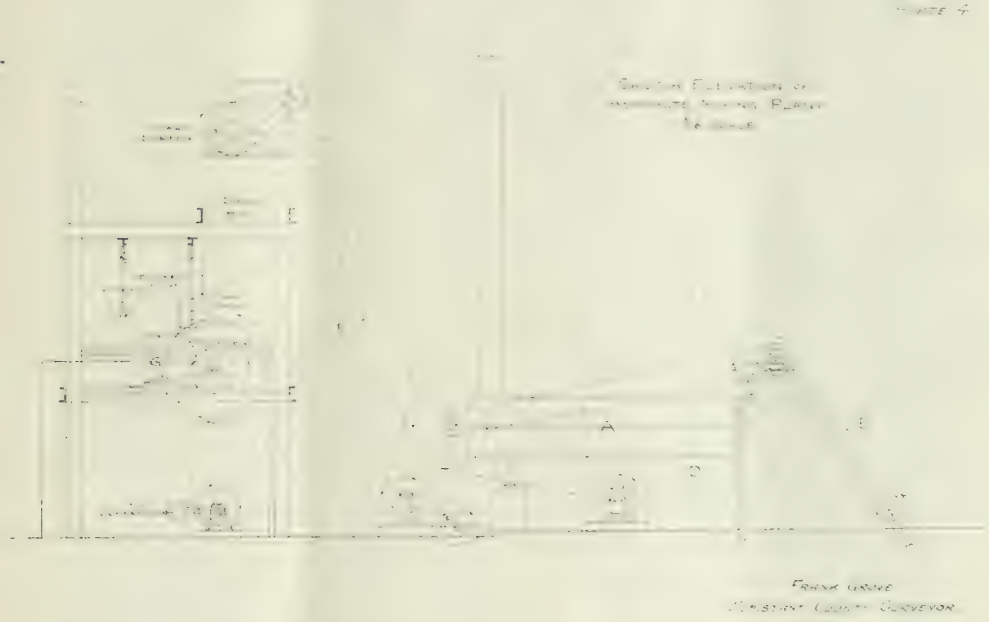
PLATE 3.



Frank Grove
Assistant County Surveyor
Surrey

rolled dry until the stone is fairly firm. The grouting mixture, consisting of pitch, oil and sand, is then poured on to the partly rolled surface, using as little of the mixture as possible to fill all voids to within about ½ in. of the top of the stone, and the surface is then lightly sprinkled with clean ¾-in. chippings. Before the grout has time to set the roller is again applied, and sufficient chippings added during the process of rolling, which is continued until the grout is squeezed up to the surface, and becomes thoroughly cooled and consolidated. After being thrown open to the traffic the surface is dressed with a further coat of pitch and oil or tar and chippings to secure a smooth and even waterproof face. Double pitch-grouting is identical except that the aggregate is laid, grouted and rolled in two separate layers. The material for the bottom coat is of 2-in. gauge, and for the top coat 1¼-in. material is used. The finished thickness of single pitch-grouting is about 3 in., and of double pitch-grouting from 4 in. to 4½ in. The method of preparation and finishing is exactly similar in both cases. In preparing the grouting mixture all the pitch and half the oil is first placed into a 600-gallon boiler, which is large enough to heat, safely, about 500 gallons, and is heated to a temperature of 300 deg. Fahr., after which the remaining half of the oil is added, the mixture being thoroughly stirred during the process of heating. Clean, sharp sand, heated in sand driers to a temperature of 400 deg. Fahr., to which is added a very small percentage of Portland cement, is then mixed with an equal proportion of the pitch mixture in a dandy or portable mixing vessel, the mixture being stirred right up to the time of actual pouring upon the roadway, which is done as evenly and quickly as possible by means of ladles or pouring cans. As a rule 1 lb. of oil is generally found sufficient for every 10 lb. of pitch, but great care must be taken that the mixture is not too brittle, which can be remedied by adding a further small proportion (about 1 in 50) of oil. A method generally adopted of testing the pitch mixture is to draw off a little, and after allowing it to cool a piece is held between the finger and thumb of both hands and stretched until it draws out to a fine thread at least 3 ft. long before breaking. The approximate quantity of pitch required for a consolidated thickness of 2 in. is 1½ gallons per yard super., for 2½ in. 1¾ gallons, for 3 in. 2 gallons, for 4 in. 3¼ gallons, and for 4½ in. 3½ gallons. The cost works out at between 3s. 6d. and 4s. per yard super. The great drawback to pitch-grouted macadam is the extreme difficulty experienced in obtaining a perfectly regular distribution of the pitch mixture, any excess of quantity being followed by a tendency of the surface to corrugate and even pull in hot weather, while with an insufficiency of the mixture the surface is not rendered completely waterproof during the winter. For these reasons the surface seldom remains so good as well-constructed tar-macadam.

Wood Block Paving.—This is, perhaps, the best form of construction for roads with a great amount of traffic, particularly upon motor-omnibus routes, but, on account of the initial cost being high, is only at present laid upon roads of an urban character, and through towns where the rateable value of the district is sufficiently high to permit of a proportion of the cost being borne by the local authority. Hitherto hardwood paving was most generally adopted, but of late years the use of softwood, which wears more evenly than hard, has been very extensively increased. The deal blocks are creosoted under pressure, and are laid upon a 6 to 1 Portland cement concrete foundation, 6 in. to 9 in. thick, floated to a smooth surface. The paving is grouted with a mixture of pitch and oil up to about ¼ in. from the surface, and the remaining space is filled with a liquid mixture of cement and sand. The cost of this class of paving has rapidly risen during recent years from 9s. 6d. to 13s., or even more, per yard super. The Local Government Board sanction loans extending over a period of ten years for softwood paving and twenty years for the concrete foundations, and this enables the cost to be spread by repayments of equal annual instalments of principal and interest over a long period. The useful life of wood paving may be taken to be at least ten years, and under moderate traffic may extend up to nearly twenty years. It is to be doubted, however, with the much heavier and speedier vehicles now in use, whether the life of this class of paving will be so extensive as it has been in the past. It may be instanced, however, that Castelnau, Barnes, has been laid over seven years, and has had no repairs to date except where trenched, although it has had a large motor-omnibus traffic ever since it was laid.



Bituminous Surfacings.—The surfacing of roads with asphalt or mineral bitumen has proved very suitable for the heaviest traffic, and particularly motor-omnibus routes. It can either be laid as a carpet coat, 1½ in. or 1¾ in. thick, directly upon the existing road crust, if sufficiently strong, or upon a base or strengthening coat, 2 in. to 3 in. thick, of asphaltic concrete. In the latter case the carpet coat can be reduced to 1 in. in thickness. The base coat consists of about 70 per cent of new stone or excavated road metal, and about 30 per cent of sand and chippings thoroughly dried

and heated before being mixed with hot bitumen. The carpet coat is composed of sand and bitumen, sand forming from 80 per cent to 90 per cent of the bulk. A small proportion of Portland cement or other suitable very fine material is used as a "filler" with the sand. The sand, after being dried and heated to a temperature of about 270 deg. Fahr., is thoroughly mixed with the bitumen heated to a similar temperature. The mixture, in a hot state, is spread and consolidated until a perfectly smooth and waterproof surface is obtained. Contractors manufacture and lay the material complete, or deliver the material ready for laying, but several county and borough councils in various parts of the country have recently had plants installed for the manufacture of this class of paving. In Surrey two plants have just recently been purchased upon the recommendation of the county surveyor, respectively, for the manufacture of the base and carpet coats, and skeleton diagrams, showing their method of working, are appended to this paper, and numbered 1 to 4. The plant for the manufacture of the base coat, which is of a portable character, as shown in Plates 1 and 2, consists of a bucket elevator (A) (having a cubic capacity of ½ yd.) which hoists and drops the aggregate into a hopper (B), from whence it is delivered into a revolving drum (C_1), and, after a certain amount of drying, is passed through another revolving drum (C_2), and discharged into the mixer (D), where the bitumen, after being heated in a portable boiler, is added and thoroughly mixed with the aggregate by means of two revolving cranks fitted with blades. While in the drums the aggregate is dried and heated, the heat being supplied from a furnace (E), and being drawn through the drums by means of a fan (F). When ready for use the material is discharged through flaps which open at the bottom of the mixer into the waiting motor lorry or cart, which can be backed right under the mixer.

The plant for the surfacing material, shown in Plates 3 and 4, is of a semi-portable character, and consists of two large cylindrical revolving sand driers or drums (A) into which the sand, hoisted from the ground by means of chain and bucket elevators (B), is delivered through hoppers (C), the drums being heated from furnaces (D). After being thoroughly dried and heated the sand is again hoisted by a bucket elevator (E) into a hopper (F), which discharges into the mixer (G), where the bitumen previously heated in two tanks (H) from furnaces (J), is added by means of a travelling and tipping bucket (K). When thoroughly mixed and ready for use the material is delivered through the collapsible bottom of the mixer into motor lorries as before described. These plants having been only very recently installed, it is too early to give absolutely accurate figures of cost, but it is anticipated that they will amount to, approximately, 1s. 6d. for the base coat and 3s. for the wearing surface per yard super. It is expected that the life of a road constructed with this class of material will be at least seven years. The covering capacity of 1 ton of material is as follows:—

Base coat, 2 in.	consolidated thickness.	10 yds.	sup.
,, 2½ in.	,,	8	,,
Surface coat, 1 in.	,,	20	,,
,, 1¼ in.	,,	17	,,
,, 1½ in.	,,	14	,,

Hitherto the prices for this class of work carried out by contractors has been from 5s. 9d. per yard super. upwards.

Generally. During the last few years every available opportunity has been taken to widen carriageways and also to reduce the camber of roads generally to about 1 in 32 with a view to encouraging, as far as possible, the distribution of the traffic evenly over the full width of the metalled surface. The reduction of camber has usually been executed by raising the sides or haunches, using large unbroken flints or other suitable material, such as limestone spalls, and thus avoiding any weakening of the subcrust of the road. Where, however, such a course has been impracticable owing to the presence of kerbs, the old road surface has been removed and the thickness of the new surfacing material increased. Upon rural roads, where bordered by grass margins and ditches, a considerable improvement has also been effected by the provision of continuous submerged reinforced concrete in situ kerbs to form an abutment for the surfacing material, and, by affording lateral support to the road, effectually preventing the heavy traffic pushing the road crust into the margin. With all methods of construction where bitumen or pitch is used in a hot state there is a very great tendency to the formation of depressions or waves, which are believed to be started by the process of rolling with an ordinary steam roller in the initial stages, and a three-axle roller has been designed which is claimed to reduce the formation of these depressions or waves to a minimum.

THE ROAD BOARD.

Constituted by the Development and Road Improvement Funds Act, 1909, for the purpose of promoting the improvement of roads in the United Kingdom, the Road Board, up to the present, so far as the county of Surrey is concerned, have chiefly concentrated their attention upon the improvement of road surfaces, and by way of grants out of the funds at their disposal have considerably assisted in the very marked improvement which has of late years been effected. Grants amounting to three-fourths of the difference between the improvement and ordinary costs have been made during the last four years towards various forms of improved surfacings, such as asphalt, pitch, and other grouting, and tar-macadams; while in the case of a scheme prepared last year by the county surveyor for the reconstruction of about 26½ miles of main roads, extending over a period of three years, the board agreed to a loan, free of interest, and repayable in five equal annual instalments, for the purchase of the necessary plant hereinbefore mentioned, and also by way of grants and free loans repayable in six years have agreed to contribute to the cost of construction, the repayment of the loans being so arranged that the cost of these roads to the county will only very slightly exceed the present cost of repairs, and will remain stationary for the period named.

The Road Board have also from time to time arranged with various county and borough councils for a number of trial lengths of roadway to be laid under the general supervision of their Advisory Engineering Committee, composed of prominent road engineers, so that the knowledge and experience gained, and the results achieved, by these experiments could be published and made use of by all road engineers, who have been welcomed to visit the works both during their progress and at any time afterwards.

The engineering department of the Road Board have also prepared for the use of surveyors and others engaged in the work of road construction and maintenance general directions for surface tarring, surfacing with tar-macadam, pitch-grouting of roads, and specifications for tars and pitch; while in 1911 a laboratory was inaugurated as a division of the National Physical Laboratory at Bushey Park, Teddington, where a road-testing machine was installed for comparing the efficiency of methods of construction.

Another important matter the Road Board have now under consideration is the question of preparing a detailed schedule of all the public roads in England and Wales, and their division into classes, according to relative importance, with a view to its use in the distribution of grants and as a basis for any future grants in aid of maintenance expenditure from the National Exchequer.

In conclusion, the author would like to express his indebtedness to the authors of various works (including "Highways and Byways of England," T. W. Wilkinson; and "Roads and Streets," D. K. Clark) in the preparation of that part of this paper dealing with the history of roads; also his appreciation of the kindness of the county surveyor in allowing him the opportunity of contributing this paper.

A report of the discussion which followed the reading of Mr. Grove's paper at last Tuesday's meeting of the Society of Engineers will appear in next week's issue.

Coatbridge Sanatorium and Dispensary.—The new tuberculosis sanatorium and dispensary at Coathill, erected for the burgh of Coatbridge, was formally opened on Saturday by Provost Davie. The buildings were designed and erected by Messrs. Wm. Bain & Co., Limited, Lochrin Ironworks, Coatbridge. They are the only buildings of their type yet erected to meet the requirements of the National Health Insurance Act. The hospital pavilion has accommodation for twenty-eight patients, and consists of two large wards with a connecting dining-room at the end of each ward.

Work of the Royal Commission on Sewage Disposal.

STANDARDS OF PURITY FOR MANUFACTURING WASTES.

By ARTHUR J. MARTIN, M.Inst.C.E.

[illegible] Report of the Royal Commission on Sewage Disposal [illegible] of more than passing notice, for it marks the close of a protracted and extensive investigation into a subject of unusual difficulty whether we regard it as to its technical aspect or in the light of the number and importance of the interests involved.

It is no reflection on the commissioners to say that they have not accomplished all that some engineers people expected of them, and that their Final Report leaves many a vexed question still unsettled.

The question of manufacturing wastes which forms the subject of the Ninth Report may be regarded as a minor one as compared with that of domestic sewage, but the difficulties which it presents are greater than those met with in the case of the latter, and the consequences of a mistake in dealing with it may be even more serious.

A high standard of purity for sewage effluents may lead to [illegible] while requirements which are unduly onerous will increase the cost of purifying the sewage. But the [illegible] necessary will rarely entail very serious hardship. In another case we [illegible] about the [illegible] community.

But in the case of a trade waste the enforcement of too high a standard of purity may have a disastrous and far-reaching effect on the industry concerned. Our manufacturers have to face competition which is already pretty severe. Often they labour under difficulties from which their foreign rivals are exempt, or at all events are not affected to the same extent. War taxes must before long press on them more severely by reducing the standard of purity for their waste liquors might easily be the last straw to the load of a struggling industry.

Obviously there must be some control. A manufacturer cannot be allowed to carry on his business in utter disregard for the amenities of the neighbourhood. But we cannot eat our cake and have it too. We must not expect to have numerous and thriving industries in our midst and yet preserve the charm of the countryside absolutely untouched.

[illegible] practically consist in weighing the [illegible] and the careful [illegible] of pros and cons. The commissioners have performed their task with a full sense of responsibility and an evident desire to hold the balance even. Their [illegible] recommendations are [illegible] to be the best which could be framed, but it would be premature on a first perusal of their report to pronounce an offhand judgment on recommendations based on the results of sixteen years' [illegible].

It is not an unmixed hardship that manufacturers should have to give heed to their waste products. The compulsion under which the gas industry found itself to make better provision for the disposal of its tar has revealed in this troublesome and despised residuum a mine of unsuspected wealth. It is true that we have allowed certain important branches of the coal-tar industry to slip through our fingers, and that alert and able competitors on the far shore of the North Sea have reaped the lion's share of the profits. But that mistake may yet be rectified. The waste products of other manufacturing processes may not all be so valuable as coal tar has proved. But it is all to the good that those responsible for these products should be compelled to call in science to aid in their disposal.

DISPOSAL IN RURAL AREAS.

The commissioners have given timely consideration to the difficulties under which a small population labours in dealing with its sewage. It is often a hardship for a poor village to have to provide and maintain works of a kind which may fittingly be called for in the case of a town or city. But, on the other hand, the village cannot be allowed to become a plague spot and a centre of infection which may spread far beyond its own borders.

The late Dr. Vivian Poore has shown how the solid and liquid wastes from a small community may be disposed of cheaply, effectually and without nuisance, and how they may even be made to yield a profit. But the methods which he employed require intelligent management and an unremitting care which it would be idle to expect in the generality of rural districts.

It may not be amiss to point out that in the Army also the refuse of large bodies of men is disposed of promptly and inoffensively by means of appliances which can be improvised in an hour or two without expense beyond that of the necessary labour. But here again the need for strict discipline and constant supervision is clearly shown.

The price of health is eternal vigilance. If small and poor communities are to be allowed to dispense with the sanitary equipment which larger populations are compelled to provide, they must not complain if the less stringent requirement is [illegible] a closer supervision.

There is another lesson which we may learn from the Army. A Commander-in-Chief does not launch a plan of campaign and then leave it to work itself out regardless of any developments which may occur. The purification of sewage has hitherto been carried on under difficulties which were largely due to the adoption of a rigid plan of campaign, and to the failure to revise our methods in the light of experience and of later scientific discoveries. The most important recommendation of the commissioners is designed to guard against the recurrence of the policy which has proved so disastrous in the past, by the establishment of a central authority competent to keep our practice in the disposal of sewage and trade wastes abreast of modern progress. The times are not propitious for legislation on such a subject, but Parliament might well spend a [illegible] time in giving effect to the [illegible] recommendations.

A BASIS FOR FUTURE DEVELOPMENTS.

By A. P. L. COTTERELL, M.Inst.C.E., President of the Institute of Sanitary Engineers.

The announcement of the completion of the task upon which the Royal Commission on Sewage Disposal has been engaged for over sixteen years certainly marks an epoch in the history of sanitary work. The nine reports issued by the commission, with their valuable appendices, have not only done much to standardise practice, but will form, for many years to come, a sound basis for future developments.

In your leader you have already referred to the character of the various reports, and have pointed out both their strength and their weakness. To most of us, perhaps, the Fifth Report and its supplement, the Eighth, stand out as the most important—the first as regulating existing methods of disposal, and reducing them, as it were, to a common factor, the second as boldly proposing to make the degree of purification dependent upon the character of the stream into which the effluent is to be discharged. These proposals brush aside the narrow views that are at present crystallised in the law of the land, which the commission consider should be altered. After all, to make the work to be done commensurate with the conditions to be met, and not with a hard-and-fast rule that makes no difference between the evil and the good, is what we engineers are constantly striving to do. It is only common sense, and should appeal to us all.

TRADE WASTES.

I should like to make a few remarks upon the chief subject dealt with in the Ninth Report—viz., the discharge of manufacturing wastes which cannot be taken into the sewers.

The committee first took up the question of trade wastes in their Third Report. They made a pro-

nouncement that the law should be altered so as to make it the duty of the local authority to provide in their sewers for trade effluents as well as domestic sewage, and that the manufacturer should be given the right, subject to safeguards, to discharge trade effluents into the sewers. I cannot help thinking that the commission, on going more fully into it, felt that this pronouncement carried them a little too far. Although perfectly reasonable in the majority of cases where manufactures are situated in large towns, such a right indiscriminately conferred upon the manufacturer might put an undue burden on the ratepayer, and enable the former to place upon the public an expense that he himself should incur. At any rate, the commission think it well, in their Ninth Report (paragraph 10), to suggest that the local authority should be empowered to make a charge on the manufacturer for the special services rendered, whether the effluent had received preliminary treatment or not.

It may well be that the authority is in a better position to treat the trade waste than the manufacturer, but to allow the latter to pass it off on to the public without further liability, except as a general ratepayer, would not tend to care on the part of the manufacturer to reduce his wastes to the lowest and least offensive limits.

The case of coal washing is one in point. There are some parts of the country where efficient plant has been set up by the colliery owner for the settlement and filtration of the effluent, with the result that it is fit for admission direct to the stream; there are other parts where there is no such plant, or only of a primitive kind, and the colliery owner seeks for the admission of his waste into the sewers, since it is quite unfit to go into the river. By the discharge of such a bulk of liquid as is required in coal washing, and such a quantity of mineral detritus, a far greater expense would be incurred in sewerage and sewage disposal than is in the least necessary, while the river itself would be depleted of water that should naturally flow along it. The result, moreover, is uneconomical, for by properly designed settlement tanks a valuable residue is recovered that can be used for briquettes and other things, and all this would be lost if it were once mixed with sewage.

BY-PRODUCTS.

In fact, this recovery of valuable material from trade wastes is one that ought to receive more and more attention, and is, I believe, likely to do so as a result of the war. Already I hear that processes are being adopted to recover material that was formerly thrown away. We know that efforts at recovery of valuable waste is always in the eye of the manufacturer to a greater or lesser extent; but we in this country may not have been quite so careful as elsewhere until shortage, due to the conditions brought about by the war, have made it worth our while to do so. Such a tendency ought to be encouraged, and no encouragement should be given to manufacturers to overlook a potential by-product simply because it is troublesome to recover.

We all know the experience of Bradford, how they have managed to turn what was almost a curse into a blessing, and are obtaining from the fats contained in their sludge enough revenue to practically cover the upkeep of their sewage works. This is an example of where it pays the local authority to take wastes from the woollen trade into their general sewerage system, because it does not interfere with the sewage treatment, and the valuable ingredients can be recovered from the sewage. No compulsion or extra charge is necessary in this case. If it pays Bradford to do this it may also pay isolated works of sufficient size to institute recovery on its own account.

In the case of tin plate and similar works it is possible to treat the wash waters and really effect a saving in the amount of sulphuric acid consumed. Some works are already realising this. In whatever direction the effluent is finally sent, whether into the sewer or the river, both the sulphuric and the muriatic acids should be neutralised, and the discharge regulated over prolonged periods by the construction of tanks.

It seems to me that the detailed attention bestowed by the commission on various kinds of trade waste will give a lead to the manufacturer to look more carefully into the subject. It certainly ought to result in better effluents, and, perhaps, in the elucidation of processes for purifying efficiently those wastes that in the present state of knowledge cannot be properly dealt with.

The general trend of this portion of the Ninth Report is far greater efficiency. It need not necessarily mean greater expense, but where it does involve outlay such outlay may either be wholly or partly repaid, or it is an expense properly allotting to the manufacture that should not be avoided.

The commission has repeatedly advocated the establishment of a central authority and of district authorities, or Rivers Boards, empowered to deal with questions of refuse disposal and of water supply. They reiterate this in their Final Report, and, in fact, make it the pivot upon which the proper working of their proposals, both as regards domestic sewage and of trade wastes, shall be based. Their proposals in this respect have been so constantly endorsed whenever the subject has come up for discussion that we may hope they will be carried into effect.

FUTURE INVESTIGATIONS.

There is one more point. The commissioners, in drawing their labours to a conclusion, refer to the question of new sources of pollution. That these will occur is obvious, as well as constantly changing conditions at existing sources. It makes one wish that the research work developed by the Royal Commission should not be allowed to drop upon their departure. Perhaps the central authority will take it up—when it is established. But even if the Royal Commission cannot be usefully prolonged on its present basis, it is needful that some other official body should take up as quickly as possible the work it has begun. Treatment of the whole subject of sanitation by Parliament is overdue. If this field be too great for the present occasion, there is sufficient non-contentious ground indicated by the Royal Commission for Parliament to work upon. Meanwhile, we may all be grateful to the Royal Commission for what they have done, for the thoroughness of their investigations, and, with minor exceptions, the practical nature of their proposals.

POINTS FROM THE REPORTS.

By H. Gilbert Wyatt, M.Inst.C.E.,
Borough Engineer and Surveyor, Great Grimsby.

Many years ago, when I was less than half the age I am at present, and had only recently come into contact with the sewage problem, I commenced to write a paper in which I called attention to the enormous sums of money which were being spent in the country on sewage experiments, and suggested that the Local Government Board should carry out these experiments at the expense of the nation, and settle once and for all what was the best method of treating sewage so as to make it innocuous.

My paper got no further than manuscript, as I discovered that, as the result of inquiries held in 1858, 1861, 1865, and 1870, "the right way to dispose of town sewage is to apply it continuously to land, and it is only by such application that the pollution of rivers can be avoided"; and that the Local Government Board was not prepared to consider any other system.

At a later date, when holding the position of deputy borough engineer at Salford, I was brought into contact with the Salford experiments, and I read a paper on February 12, 1898, in which I called attention to the work of Mr. Robert Warington, Mr. Dibdin, the State Board of Health of Massachusetts, Colonel Ducat, Baldwin Latham, and Mr. Joseph Corbett, then borough engineer of Salford, and the fact that bacterial treatment in filters was equally efficient as land treatment: and I concluded the paper by claiming "that the time had arrived when the Local Government Board should be roused from its state of agnostical immobility and should seriously take upon itself to examine whether there is the efficiency in bacterial filters that is claimed for them."

Within one month from that date (and though I can say *post* I dare not say *propter hoc*) it was announced in the House of Commons that the Government intended to appoint a commission which was to inquire into the whole question.

Sixteen and a-half years have elapsed since that date, and the Royal Commission on Sewage Disposal has issued its Ninth and its Final Report.

Several points stand out clearly:—

(1) That the Local Government Board is now prepared to consider and accept almost any system which can reasonably be laid before them, if supported by experiments and analyses.

(2) That the available methods of sewage purification are as diverse as is sewage itself; and we know the sewage of any ordinary town varies from hour to hour during the day.

The Surveyor
and Municipal and County Engineer.

(3) That the fixing of a standard of purification or of pollution is not necessary, although recommended in the Ninth Report, as so much depends upon the bulk of the main stream when compared with the quantity of effluent discharged into it.

(4) That the question of manufacturing wastes needs further consideration, and that a new Rivers Pollution Prevention Act is necessary.

(5) That the commissioners have carried out their work on a thoroughly efficient scale, their reports, which together form a monumental volume, though stereotyping nothing, yet include every phase of the sewage purification question; and an engineer has only to read between the lines, mingling imagination with his knowledge, to be able to deal with the sewage of any town, remembering that an engineer is one who can do for ten million what any other man can do for a sovereign.

EXHIBITS AT DUBLIN SPRING SHOW.

In conjunction with an exhibit of road metal preparing machinery shown by Messrs. W. H. Bevis, Limited, of Leeds, on Stand 150 at the Dublin Spring Show—which opened on Tuesday—there is also on view a 5n.h.p. compound steam traction engine made by Messrs. Marshall, Sons & Co., Limited, Gainsborough. This engine has high and low pressure cylinders of, respectively, 5½-in. and 8½-in. diameter, with a 10-in. working stroke, and is suited for a continuous steam pressure of 180 lb. per square inch. The cylinder casting, which incorporates the steam chests, is mounted on a pressed-steel fixing with planed face, riveted to the boiler shell.

The slide valves are readily accessible from the top of the cylinder casting, the covers being arranged so that the valves can be examined or adjusted without disconnecting any of the rods, and, if necessary, while the boiler is under steam.

A by-pass or auxiliary steam valve is provided to enable boiler pressure steam to be admitted to the low-pressure cylinder, in order to give temporary increased power for starting with a heavy load, or when crossing difficult ground, as well as to facilitate the ascent of a steep incline.

The cylinder lubrication of this engine is effected by a mechanically operated positive action oil-feed pump; the power transmission mechanism includes a four-pinion compensating gear, and for feeding the boiler an automatic injector and feed-water pump are provided. The engine is also equipped with a cross-arm quick-speed governor acting on an equilibrium throttle valve, water lifter, winding drum, and other usual accessories.

INSTITUTION OF CIVIL ENGINEERS AND PROFESSIONAL CHARGES.

COUNCIL'S STATEMENT TO CORPORATE MEMBERS.

A memorandum as to professional charges of corporate members of the Institution of Civil Engineers has been issued by the council of that body. The council trust this may be of assistance to the members, and may conduce to uniformity in the basis upon which such fees are fixed, and they are at the same time of opinion that this authoritative declaration upon the subject will be serviceable generally.

The council are of opinion that the nature of professional engineering services renders it difficult to lay down any comprehensive scale of fees to cover the varied conditions under which such services are given. Engineers with larger experience command fees for such work on a higher scale than younger and less experienced engineers; but it may be expedient that some authoritative statement should be made by the council as to professional charges, which will afford some recognised measure of the value of certain engineering services.

The council accordingly state that the customary remuneration for ordinary professional engineering services, as distinct from remuneration by salary, for the design and superintendence of the construction of works in the United Kingdom is a commission of 5 per cent upon their cost, which commission, however, is liable to be varied in accordance with the nature and magnitude of works and the character of the services rendered, as follows:—

(1) In the case of undertakings where the services rendered by the engineer are large relatively to the extent and cost of the work, or in the case of undertakings involving a considerable amount of intricate and detail work, the commission of 5 per cent may be increased. On the other hand, in the case of exceptionally large undertakings, the commission may be reduced by agreement.

(2) The preparation of bills of quantities, payments to resident engineers and inspectors, and also personal travelling expenses, are matters for arrangement depending upon the nature of the work and the circumstances under which it is carried out, and may be included or not included in the engineer's remuneration according to the extent and difficulty of the works and the amount of detail work involved in the preparation of the plans, drawings, specifications and bills of quantities, and also the amount of superintendence by the engineer's staff necessitated by the character of the work.

Where the works are designed in sufficient detail to enable a contract for their execution to be made or to enable the Local Government Board to hold an inquiry into the propriety of allowing an authority to borrow money for the purposes of the works, but where the carrying out of such works is deferred indefinitely or abandoned, the fee for services up to this stage is one-half of the ordinary commission.

The council are advised that plans and specifications prepared by an engineer belong, as chattels, to the client, after payment of the agreed fees; but the copyright in all original matter contained in such plans and specifications remains vested in the engineer. Neither the client nor any other person is entitled to multiply copies of plans and specifications so far as the original matter therein contained is concerned, and, further, if such original matter has "an artistic character or design" the plans can only be used for the purpose of the particular structure for which they were prepared by the engineer, or for such other purpose as he may authorise. Original matter in specifications is defined by counsel to be a composition or arrangement of the author—something which has grown up in his mind, and would, if applied to patent rights, be called invention.

Charges for reports on engineering proposals must necessarily be largely dependent upon the extent of the inquiry and research upon which the reports are based, and upon the professional standing of the engineer employed, and cannot, therefore, be dealt with in any scale of fees.

Remuneration for services in preparing for and giving evidence before Parliamentary Committees or other tribunals generally consists of a preliminary fee, and a charge per diem while engaged upon the preparatory work and during the hearing of the inquiry, as well as all out-of-pocket expenses.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:

466. Road Making. Describe a few simple tests that will enable an engineer to ascertain the quality of the bitumen and filler to be used in a bituminous macadam road. (Eneer.)

469. Sewage Sprinklers.—Give a good practical method of marking off the holes in the distributing arms of revolving sprinklers. The diameter of holes to be constant. (C. A. B., *Carlisle.*)

471. Building Construction. What is a [illegible]? Explain its function, and give sketches in illustration. (M. T. R., *Blyth.*)

473. Retaining Wall.—Explain carefully the different ways in which a concrete retaining wall may fail, and state how such failures may be avoided. (M. T. R., *Blyth.*)

REPLIES TO QUESTIONS.

472. Statics. Discuss the relative advantages of the graphical and analytical methods in the determination of the stresses in a framed structure. (M. T. R., *Blyth.*)

Stresses in the members of framed structures may be found (1) by pure mathematics, analytically; (2) by graphic statics. By the analytical method correct results to any number of decimal places may be obtained. By graphic statics the result will vary according to the accuracy of the drawing, but with care sufficiently correct re-

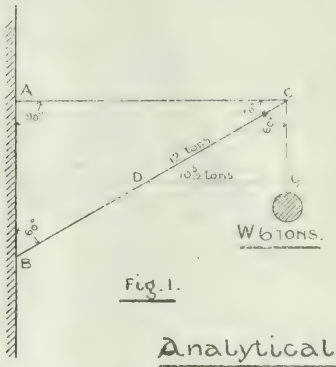

Fig. 1.

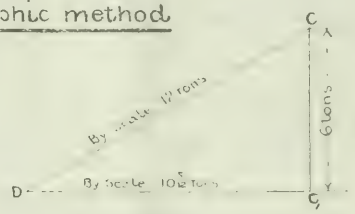

Fig. 2.

Analytically

Stress in BC = W sec 60° = 6 × 2 = 12 Tons

AC = W tan 60° = 6 × 1·732 = 10·392 Tons.

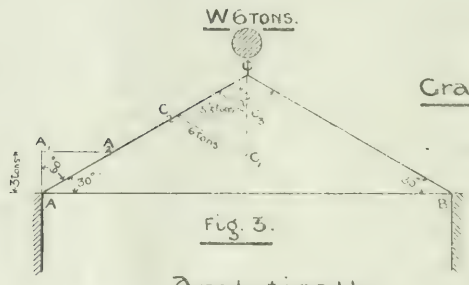

Fig. 3.

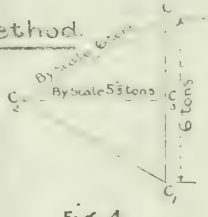

Fig. 4.

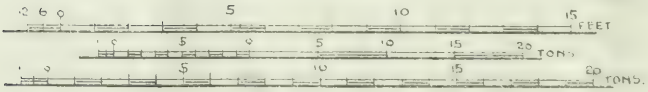
Analytically

Stress in AC = ½W sec 60° = 3 × 2 = 6 Tons

AB = ½W tan 60° = 3 × 1·732 = 5·196 tons



error should be very small, and, as a margin of safety of from four to ten times the calculated breaking strength is provided, this error is practically immaterial. Fig. 1. A weight of 6 tons is suspended from the extremity C of an inclined prop BC, the other extremity B [illegible] wall. A [illegible] the AC [illegible] end, the other being fixed to the wall. On the vertical line through C set off $CC_1 = 6$ tons; from

C, draw C D parallel to CA, meeting CB in D, then by scale CD = 12 tons, compressive stress on CB and by scale C D = 10 tons, or 19·41 tons tensile stress on CA. The diagram is shown in Fig. 2 drawn separately, and to a larger scale. By analytical method it will be seen that stress on CB = 12 tons and on CA = 10·392 tons. The analytical method shows an error in the graphic method in the CA and for this reason the two lines CA in the diagram of the graphic method a larger scale should be used or the analytical method the tan was only taken to three decimal places. Fig. 3 represents a simple truss resting on two walls, and supporting at two points V C W, equally inclined to the horizontal at an angle of 30 degs., and a horizontal tie AB connecting the feet of the rafters. With a weight of 6 tons at the apex C and the stresses on the rafters and tie beam. Figs. 3 and 4, with the previous explanation given with Figs. 1 and 2, will be perfectly clear. It will be seen that by analytical method greater accuracy can be obtained than by graphic statics, but for all general purposes the latter is quite sufficiently accurate, quicker and considerably less laborious. E. W. P. [illegible]

THE ROAD BOARD.

GRANTS TO HIGHWAY AUTHORITIES: EIGHTEENTH LIST.

During the months of January, February and March 1915, the Road Board has indicated additional grants to highway authorities amounting, in the aggregate, to £80,143, of which £71,449 was by way of [illegible] and £8,694 by way of loan.

The advances made and indicated up to March 31, 1915, less indications cancelled, amount to £6,034,447. Of this total £4,580,034 is by way of grant and £1,454,413 by way of loan.

The formal grants completed with the approval of the Treasury, during the last quarter, amounting to £190,852 were applied as follows:

Road crust improvements	£ 132,...
Road widening and improvement of curves and corners ...	10,...
Road diversion ...	2,112
Reconstruction and improvement of bridges	1,450
New roads and bridges ...	2,907

County or County Borough.	Amount of grant for

* NOTE.—This amount of £45,709 is made up as follows:—Brentford £5,422, Chiswick £6,810, Croydon (C.B.) £18,950, Hornsey £1,784, Islington £4,320, Shoreditch £365, Southall-Norwood £1,463, Staines £954, Sunbury-on-Thames £922, Tottenham £478, Willesden £1,361, Yiewsley £80.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Was it not about time that the Institution of Civil Engineers should issue a statement as to the profession[illegible] not had with [illegible] on the [illegible] that has been published, which fixes the commission on works [illegible] ing to the services rendered by the engineer, or where the work is intricate and involves a large amount of detail work? Is it not well, too, that it has also been decided that where a scheme has been prepared and the clients abandon it from no fault of the engineer, he may charge one-half his commission? Have the council of the institution at last awakened to the fact that they have many duties to perform on behalf of the members besides the arranging of papers to be read and attending to other simple departmental [illegible]

* * * *

[illegible] on having drawn attention to the want of popularity of the civic engineer, and for having suggested that annual reports and so forth might be written in more literary and popular style? Is it not proverbial, however, that many engineers, who are men of deeds, not words, find it difficult to put their ideas on paper, [illegible] Would it not tend to make engineering more popular if some well-known author could be induced to "write up" the subject? Why could not poetry be substituted for prose? Who was the author of the poem commencing "A microbe basking in a septic tank"?

* * * *

Where is Quarry Bank, and why wouldn't the [illegible] as recommended by their surveyor? What must be the condition of the roads in this place if these necessary auxiliaries to decent roads are not forthcoming?

* * * *

Is it true that there is a movement on foot to standardise the wheel track of all self-propelled vehicles to a gauge of 4 ft. 8 in.? If this is carried out, will not such a proposal have a tendency to damage the roads still more, as every vehicle will then follow in the track of the other? Does not the present variation in gauge tend to prevent this? And will it not be an evil day for road makers if the proposal is carried into effect?

* * * *

Do we not, in reading between the lines of Mr. John A. Brodie's excellent address to the members of the Liverpool Engineering Society, gather that, although he is not inclined to the view that the days of tramways are numbered, he evidently considers that they are out of place in crowded thoroughfares? Is it not interesting to observe that an engineer who has done so much for tramways should now consider that an improved tramway may hold its own provided sufficient width is given to enable the cars to travel at a high rate of speed, independent of the general traffic? Does not this expression of opinion from so [illegible] authority show that the "tramway" of the future must in reality be a "light railway"?

* * * *

Is it not to be regretted that, although the reports of the Royal Commission on Sewage Disposal have been so valuable, their labours should cease when so many fields of investigation are still open for exploration? Would it not be an excellent idea for the Government to appoint a permanent commission in order that investigations and inquiries could be still further pressed into this important subject?

London and Lancashire Fire Insurance Company.—The directors of this company propose to pay, on the 1st proximo, a further dividend of 15s. per share, less income-tax, making, with the interim dividend of 14s. per share, less income-tax, paid last November, a total of 29s. per share, less income-tax, for the year 1914.

New Warrington Bridge.—The unveiling recently of a commemorative tablet affixed to the new ferro-concrete bridge over the Mersey at Warrington marked the completion of a structure which has taken three years to build and cost £23,370. The mayor, Alderman Peter Peacock, stated that the bridge was the second widest in Great Britain, and was only 2 ft. less than Westminster Bridge, London.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Boston T.C. (July 24th. Mr. R. H. Bicknell).—£3,600 for the erection of a refuse destructor. The borough surveyor, Mr. G. E. Clarke, stated that the proposed site for the destructor was the property of the town council, and consisted of 3 acres. The proposed destructor was one of the Meldrum type of three cells.

Naas U.D.C. (March 29th. Mr. A. P. Price).—A supplemental loan of £400 for the purpose of extending the sewerage system, and £200 for completing a building scheme for working-men's dwellings under the Housing of the Working Classes Act.—Evidence in support of the application was given by Mr. J. Boyle, town clerk, Mr. Hall, surveyor, Dr. Murphy, medical officer of health, and Messrs. Butterfield (chairman of the council), M. Fitzsimons and J. Dowling.

Ogmore and Garw U.D.C. (April 8th. Mr. A. W. Brightmore).—£19,997 for sewerage and sewage disposal works.—It was explained that the Ogmore and Garw Valleys were sewered years ago, and that the sewers discharged on a sewage farm at the bottom of the valleys, near Brynmenyn. Part of the loan was needed for the reconstruction of sewers at the top of the valleys, and part for the extension and improvement of the sewage disposal works. The sewers at the top of the valleys had been interfered with by colliery workings and by coal tipping. In some parts the sewers had been rendered absolutely useless, and the need of reconstruction was so urgent that the council had already carried out a portion of the work. This was a rapidly developing district, the population having increased by 50 per cent since 1891. Mr. Midgley Taylor, Westminster, gave details of the engineering features of the scheme.

Pontefract T.C. (March 31st. Mr. P. M. Crosthwaite).—£21,000 for works of sewage disposal.—A correspondent has favoured us with the following supplementary information with regard to the proposals outlined at this inquiry—an account of which was given in our last issue. The scheme consists in the provision of screening arrangements, followed by detritus tanks, after which the sewage is to be treated with alumino-ferric, and, passing down a mixing race, will be dealt with in four precipitation tanks with a total capacity of 360,000 gallons. The sewage is then to be dealt with on six percolating filters of 110 ft. diameter, and 6 ft. deep, the effluent from which will pass into three humus tanks, and have final treatment on four sand filters, the effluent being discharged into the Wash Dyke, near the Pontefract main road. It is intended to treat three times the dry-weather flow, or 1,800,000 gallons, as ordinary sewage, which will be taken off by floating weirs. The excess above this quantity and up to six times the dry-weather flow will be treated in storm-water tanks of 180,000 gallons capacity. During cleansing operations the top water in the tanks will be taken off by floating arms to a pump well, from which it will be raised to a receiving tank, and the contents allowed to flow slowly back to the mixing race, after which the sludge will be drawn off by sludge valves, and pumped to six sludge filters, the drainage and top water of which will also flow into the mixing race. Pumping plant for this purpose, consisting of oil engines and centrifugal pumps, will be installed. The engineers are Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne, and the scheme is supported by the Rivers Board.

Seisdon R.D.C. (March 30th. Mr. M. K. North).—£900 for works of sewerage and sewage disposal.—It was explained that in March, 1912, the Local Government Board granted a loan of £7,500 in order that a good sewerage scheme might be culminated. It was embarked on under pressure from the Local Government Board and the County Council, and there was no doubt that it was absolutely necessary for it to be undertaken. Instead of the cost being £7,449, as was estimated, it had turned out to be £8,351. The reason for the great difference was that between the time the estimates were made and when the Local Government Board granted the loan there was a considerable rise in the prices of materials and labour. Another reason for the increased cost of the undertaking was that they had unexpected engineering difficulties, and there had been some useful extensions of the scheme.

APPLICATIONS FOR LOANS.

Leyton U.D.C.—£17,000 for additional electricity plant.

Nottingham T.C.—£40,304 for the Carter-gate and Manvers-street improvement scheme.

Pontefract T.C.—£1,100 for an automatic lighting scheme, and £269 for sewerage works.

Tottenham U.D.C.—£13,000 for a school for deaf and defective children.

West Ham T.C.—£3,000 for electricity mains.

Wigan T.C.—£6,000 for new boilers at the electricity works.

LOANS SANCTIONED.

Arklow U.D.C.—£1,400 for the erection of additional houses.

Barrow T.C.—£12,500 for electricity purposes.

Dalkey (Co. Dublin) U.D.C.—£10,500 for workmen's houses.

Dundalk R.D.C.—£10,370 for the erection of sixty-one houses.

Holywood U.D.C.—£5,750 for the water supply scheme (repayment in thirty years).

Manorhamilton R.D.C.—£3,060 for the erection of cottages.

Whitewashed Kerbs.—The Commissioner of Police is asking all the London local authorities to whiten the street kerbs during the present reduction of street lighting, the experiments that have been made in whitewashing of this kind having proved useful.

Bristol Tramways Purchase.—Mr. C. P. Sparks, the corporation's consulting electrical engineer, Mr. P. Addie, the city valuer, Mr. L. S. McKenzie, the city engineer, and Mr. Faraday Proctor, the city electrical engineer, have been instructed to value that portion of the Bristol tramways which is purchasable by the town under sec. 22 of the Tramways Act. The purchasable part includes 25 route miles out of a total of 31 route miles, and includes also the St. George and the Counterslip power stations and the depots of the company. It is reported that the total amount of their general valuation amounts to £610,981, the valuations being based on the present prices of material.

Road Wear by Railless Trolley Vehicles.—Bradford City Council some time ago appointed a sub-committee consisting of members representing the Streets, Drainage and Works, and Tramways Committees, to consider questions arising from the wear of roads on railless trolley vehicle routes. It is reported that this sub-committee has decided to recommend that some annual contribution, on a basis to be determined later, should be made by the Tramways Committee to the funds of the Street, Drainage and Works Committee, without prejudice to the position of either bodies concerned, in respect of the extra expenditure found to be necessary for the maintenance of roads on railless trolley vehicle routes in the city.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars are given:—Building—Bath, Leyton, housing and town planning—Melton Mowbray, Swaffham [illegible] roads—Manchester, Middlesex, Wrexham sewerage and sewage disposal Bedale [illegible] and electricity—Filey, Riccall.—Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Bath T.C.—The council are recommended by the Baths Committee to proceed with partial the [illegible] in connection with the Royal Baths and pump-room, at an estimated cost of £2,000 [illegible] £4,000 to be expended at once.

Bradford T.C.—The Health Committee recommend the town council to purchase a site for a small-pox hospital. The committee have also approved a scheme [illegible]

Cheltenham T.C.—The borough surveyor, Mr. J. S. Pickering, has prepared a scheme for the provision of radiant light and heat [illegible]

Leyton U.D.C.—The council have adopted a recommendation of the Fire Brigade Committee to build a temporary fire station on the council's land in Church-road, Leyton. The cost is estimated at £4,000 and £5,000, and it was stated that a certain amount of the work could be carried out by the [illegible]

New Forest R.D.C.—It was reported recently that Culverley new bridge had now been finished. The contractors (Messrs. Bright & Son) were liable for the bridge for six months after it was handed over. That time had expired, and the final test had been applied. The engineer, Mr. W. H. Masters, said that the contractors had made a most excellent job of the work. The bridge had been subject to a stringent test—two traction engines going over it abreast—and it was satisfactory. The total cost of the structure was £296.

Truro T.C.—The tender of Messrs. C. & J. Harris, of Truro, at £766, has been accepted for alterations to the municipal buildings.

West Riding C.C.—The county council has in the erection of the Bradley new schools specified the powder Pudlo for rough-casting the buildings. When Pudlo is included in the cement, rought-cast work is, we are assured, made quite impervious to driving rains.

HOUSING AND TOWN PLANNING.

Bideford R.D.C.—It was reported on Monday that the council had practically completed the erection of ten houses under Part II. of the Housing of the Working Classes Acts, loans for £2,346 having been obtained for the purpose. There was plenty of competition for the cottages, but the best rent that could be obtained by tender was 3s. 6d. per week inclusive. The scheme was not self-supporting, and it was probable there would be an annual charge of about £25 to the general district fund of the council, or about ¼d. in the £ calculated on the present assessable value.

Conway R.D.C.—The council have resolved to ask the councils in the rural area to consider the question of housing accommodation, and report to the council as to whether they were in favour of the council adopting the Housing Act of 1914. The surveyor, Mr. T. L. Oliver, in reporting upon the recent conference at Bangor on housing and town planning, referred particularly to the question of the width of the roads in rural areas, which has become important owing to the change in the mode of traffic. Living in the country was becoming more popular, and new property was being erected, so that the authorities of the rural districts should have power to see that wider roads should be provided for. New villages should be properly laid out under the control of the authority, and in each village a place for children to play in should be arranged for. So many motor cars and traction engines now passed along the roads that they were dangerous for children as playgrounds. Every village should have its village green.

Melton Mowbray R.D.C.—The Local Government Board have written that it appeared the council would find it difficult to deal adequately with existing conditions unless further working-class accommodation was provided, and as the board did not gather that private enterprise was likely to meet the need, they thought it would be necessary for the council themselves to provide some dwellings under Part III. of the Housing of the Working Classes Act, 1890. The council decided to ask permission to postpone further action, owing to the increased cost of building.

Swaffham U.D.C.—A letter has been received from the Local Government Board stating that they have had under consideration the report of their inspector, Mr. Leonard, after the inquiry held by him under the Housing and Town Planning Act, 1909, and they had come to the conclusion that further housing accommodation was necessary, and suggested that the council should submit definite proposals. If the council were prepared to take action at once they would be prepared to accept a proposal for the provision of eighteen houses.

Thedwastre R.D.C.—In reply to a question as to the progress made with the provision of houses, the clerk stated that the difficulty was to get the Local Government Board to state what their policy was. Inquiries had been held by the board in East Stow, and he had questioned the inspector as to getting the board to give a general expression of opinion as to whether local authorities could proceed with schemes involving capital expenditure during the war, and there had been a promise from the inspector that he would let him know. He was therefore allowing things to hang up a bit with regard to schemes not advanced.

PARKS AND OPEN SPACES.

Wallasey T.C.—The second bowling-green at the Oakdale recreation ground, Seacombe, was formally opened on Saturday last.

REFUSE COLLECTION AND DISPOSAL.

Guildford T.C.—The borough surveyor, Mr. E. Y. Harrison, submitted recently a report on the destructor. The consumption at the destructor for the last month, it was recorded, equalled 369¾ loads, against 486 loads in the corresponding period of 1914. The consumption of auxiliary fuel during the past month was as follows: Coal 33 tons 14 cwt., coke 17 tons 7 cwt., showing an increased consumption of 40 tons 2 cwt. During the corresponding period of 1913, 29 tons 3 cwt. were consumed. The increase in auxiliary fuel was undoubtedly due to the large decrease in the refuse collected. The refuse itself was of much less value as fuel on account of the special conditions now prevailing. Greater care had been exercised in stoking, and the refuse had been sufficient for generating the steam required during twenty hours of the day on five days in each of the last two weeks. The amount of rainfall recorded for the past month equalled 5·2 in.; for the corresponding period last year the rainfall was 3·52 in. The committee decided not to accept an offer to collect the bottles, crockery and old tins from the destructor on payment to the council of £20 per annum. It was explained by the chairman of the Sanitary Committee that as the committee were far from being satisfied with the continued increase in fuel consumption, the borough surveyor was paying visits to other destructors.

ROADS AND MATERIALS.

Berwickshire C.C.—The East District Committee have agreed to make a new departure in regard to tar-spraying by purchasing a large tar-boiler, and doing the spraying by direct labour.

Cardiganshire C.C.—Approval has been given to a scheme for tar-macadamising 2 miles of roads, at an estimated cost of £3,800, of which half will be contributed by the Road Board.

Claremorris R.D.C.—There is evidently great need for improved roads in the rural district, for it was stated by a councillor at the recent council meeting that "when the doctor and priest were summoned on sick calls at night, they risked their lives in trying to reach the people's houses." Another member in-

stanced villages which, he declared, were described as being "buried alive" for lack of road accommodation. Such picturesque metaphor may possibly present an exaggerated view of the position, but, be this as it may, the council have resolved to do everything in their power to meet the difficulty by deciding to pass all the urgent and necessary works, "wherever the money is to come from."

Clitheroe R.D.C.—Channelling and kerbing works are to be carried out in Mytton-road, at a cost of £430.

Dumbarton C.C.—At a meeting of the Western District Committee last week communications were read from Government departments suggesting the delay during the war of schemes involving capital expenditure, so that capital as well as labour might be made available in the direction in which they could best further the national interest at this time. Various road improvement schemes were accordingly delayed.

Essex C.C.—Repairs are to be carried out on the main road near Baddow Court, Great Baddow, at an estimated cost of £500. It has also been decided to reconstruct part of the road between the Ilford and Romford boundaries, at an estimated cost of £17,000.

Kensington B.C.—A proposition has been carried to plant trees in the central or northern section of Holland Park in the autumn.

Manchester T.C.—It is proposed to incur an expenditure of £39,700 in the purchase of property in Cross-street for a widening scheme.

Melksham U.D.C.—The tender of the Eagle Manufacturing Company, at £51 10s., has been accepted for the supply of a water cart to hold 400 gallons.

Merton U.D.C.—It has been agreed to employ a youth, at wages not exceeding 15s. a week, to check the receipts and issue of stores and tools at the depot. Replying to a suggestion that the road foreman could do the work, the chairman of the committee which submitted the proposal said the road foreman should be on the roads, and not doing boy's work at the stores.

Middlesex C.C.—The council are taking preliminary steps with regard to the construction of the Great West road, and have agreed to pay a further £13,500 compensation to freeholders and leaseholders in respect of land and property to be acquired.

Pickering U.D.C.—The surveyor, Mr. William I. Spink, has been instructed to obtain a supply of distilled tar in order to allow the disuse, at the request of the War Office through the Road Board, of crude tar, the by-products of which are largely used in the manufacture of high explosives. The surveyor stated that a good deal of crude tar had been used by the council on the roads and footpaths.

St. Germans R.D.C.—The surveyor, Mr. Harold Hockaday, has submitted an estimate, at £367, for remaking the road from Cross Park to the new military camp, Weard, St. Stephens, which the council have approved. The cost of the work will be borne by the military authorities.

Westhoughton U.D.C.—The council have submitted to the county council an estimate of £3,850 for the improvement of New Brook-road.

Woodbridge U.D.C.—It has been agreed to treat the roads this year with calcium chloride in place of tar.

SEWERAGE AND SEWAGE DISPOSAL.

Bedale R.D.C.—A scheme has been adopted for the extension of the sewage disposal works.

Belper R.D.C.—The surveyor, Mr. Robert C. Cordon, has been instructed to prepare a scheme for the drainage of Horsley Woodhouse, comprising new sewers and sewage disposal works. He has also received instructions to examine and report on the condition of the main sewers in the parish of Allestree, and to submit an estimate of the probable cost of taking up and relaying certain defective lengths.

Glasgow T.C.—An echo of the war and German piracy was suggested by a question asked at the recent council meeting if the war bonus granted the crews of the sludge steamers "Shieldhall" and "Dalmuir" was because of any risks of torpedoing which might be run. Bailie Kennedy explained that the boats had to enter what had been declared a war zone, and the increase granted was similar to that given by steamship companies to their employees under similar circumstances.

Halstead R.D.C.—It has been agreed to engage Messrs. Taylor & Wallin, Newcastle-on-Tyne, to prepare a preliminary plan for the disposal of the sewage of Castle Hedingham.

Magherafelt R.D.C.—The Local Government Board have sanctioned a scheme of sewerage for the district of Castledawson.

Stirlingshire C.C.—The Eastern District Committee have submitted to the county council a scheme for the improvement of the filter-beds at the Bonnybridge sewage disposal works, at an estimated cost of £650.

WATER, GAS, AND ELECTRICITY.

Filey U.D.C.—The extension of the pumping and boring plant, at an estimated cost of about £2,000, is under consideration.

Kingstown U.D.C.—Mr. J. P. Tierney, M.Inst.C.E., of Dublin, has been appointed consulting electrical engineer to the council, and instructed to prepare a scheme for the electric lighting of the district, and supervise the carrying out of the work, at a fee of 5 per cent.

Leeds T.C.—In view of the Treasury circular with respect to the expenditure of public money, the Waterworks Committee felt that, if possible, the great work on the Leighton dam might be suspended for twelve months at least. From the outset the scheme was undertaken more to provide for the future than to meet any immediate necessity, with, of course, the further consideration that if Leeds did not secure this valuable gathering ground some other town might step in and do so, leaving future generations of Leeds citizens to grapple with a serious difficulty. Now that the scheme for supplying Doncaster with the surplus water has been dropped there is even less need than there was for any hurry in the matter. An arrangement will, of course, have to be come to with the contractors, Messrs. Arnolds, who have still two years' work before them to complete their contract, but it is anticipated that no difficulty will arise.

Riccall R.D.C.—It was reported at the council meeting held recently that the Local Government Board had sanctioned the proposed loan from the Barlby water supply scheme.

Southgate U.D.C.—The surveyor, Mr. C. G. Lawson, has been instructed to endeavour to arrange, as an alternative to the present darkening of the upper portion of the street lamps, for one in every two or three lamps to be kept fully lighted, the remaining lamps not being lighted.

West Penwith R.D.C.—Acting upon the advice of the Local Government Board, the council have closed all the wells permanently, and the water supply has been supplemented. It was reported that other requirements with regard to sanitation were being considered.

MISCELLANEOUS.

East Molesey U.D.C.—The wages of the workmen have been increased by 2s. per week, as from March 6th last, for the continuance of the war.

Haddingtonshire C.C.—The council have refused to grant an increase of wages to roadmen who are physically fit and under thirty-eight years of age, but have given an increase to men over thirty-eight.

Newcastle (Ireland) U.D.C.—Attention was recently directed to the desirability of providing more adequate arrangements to cope with an outbreak of fire, and it was agreed that the surveyor, Mr. D. M. Gracey, should submit an estimate at the next meeting for erecting and furnishing with hose and stand-pipes two fire stations at the extreme ends of the town.

St. Thomas R.D.C.—The question who is responsible for clearing brooks was raised upon a report by the surveyor, Mr. J. Bray, that the silting up of Alphington brook had caused the flooding of two roads, doing serious damage and making the roads impassable. Mr. Maunder said it was a matter that should receive attention. The brook was still silting up, and as they had spent £40 or £50 upon the road already, it was serious. The council had always taken the view that it was the duty of landlords to clear brooks, but inasmuch as the council had jeopardised that position by paying in some cases, he doubted whether they could enforce it. The Earl of Devon had offered to clear out the Abington brook if the council would contribute £10 to the cost. The clerk, Mr. A. E. Ward, said he did not think the council could compel the landlord to do the work. Mr. Loram: Then why have we compelled others? The clerk: We have not compelled them. We have invited them to do so, and in many cases they have done so. Mr. Loram: Then where you have a soft compliance you let them pay. If we do this work now we must do it elsewhere.

Wrexham T.C.—A new motor fire engine, by Messrs. J. Morris & Sons, Salford, purchased by the council

for £1,000, was objected to a series of tests on Friday last at the corporation depot, Willow road.

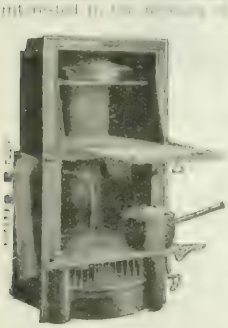
Surbiton U.D.C.—On the recommendations of the Drainage and Highways Committee respectively it was on Monday agreed to grant an increase for the period of the war, to all men engaged at the sewage disposal and refuse destruction works or on the highways, also to recently engaged men from 40s. per week.

Teddington U.D.C.—Mr. C. H. Parker, of Bath, has been appointed [illegible] for the [illegible] extensions at a salary of £[illegible] per week. The contract [illegible] Messrs. Mowlem & Co., Limited, to take payment for the new motor fire [illegible] by instalments—one-third on the [illegible], one-third twelve months after, and the balance at the end of a further twelve months, such payments to be without interest. By this concession it is estimated the council will save £264, the interest payable if a loan had been raised and repaid over ten years. The clerk, Mr. G. H. Salmons, said he had been informed that, though the Local Government Board would not formally sanction this arrangement, they would raise no objection.

Tiverton T.C.—The borough surveyor, Mr. J. Soldan, reported to the council on Monday that 20 per cent of the council employees enlisted on the outbreak of war, and that he had given a Local Government Board inspector the names of further men on the staff who could be spared if necessity arose, in which event all [illegible] would be provided.

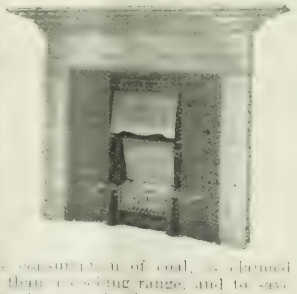
CONVERTIBLE STOVE FOR WORKMEN'S DWELLINGS.

In view of the [illegible] housing schemes being carried out by municipal authorities, it is an opportune moment to [illegible] surveyors and others interested in the working [illegible] the patent convertible stove known as the "Interoven." [illegible] to all that a cooking range is a veritable coal-eater. With it an enormous quantity of fuel is consumed in cooking a meal, and the greater part of the heat generated passes away up the chimney.



Briefly, the ordinary [illegible] the fire-[illegible] the sloping fire-back is lowered over the fire, closing it [illegible] and [illegible] [illegible] [illegible] and two [illegible] openings.

The cooking stove, the top [illegible] door, lets down, revealing an oven behind, and itself [illegible] The oven, which is [illegible] by 13 in. [illegible] 12 in. high, is capable of cooking a meal for eight or nine persons. The stove is fitted with a boiler which will heat a 30-gallon hot water tank, and can be easily fitted to any existing pipes.



This stove, in addition to being economical in its consumption of coal, is claimed to cost less to fit than a cooking range, and to save upwards of 20s. per house in brick work and labour. An important point for the tenant is that its use makes possible the conversion of a kitchen into a comfortable sitting-room.

The "Interoven" Stove Company, Limited, of 136 Charing Cross road, W.C., inform us that all engineers, architects, or others interested in housing schemes, will call upon them, they can see the "Interoven" stove in use, and will be given a practical demonstration of its value.

PERSONAL.

Mr. J. Ryan Pembroke, Co. Dublin, has been appointed county surveyor by the Queen's County Council.

Mr. W. J. Burgess, of Combemartin, has been appointed highway surveyor to the Launceston Rural District Council.

Mr. H. Hamer, assistant borough surveyor of Stockport, has been promoted to the position of deputy borough surveyor.

Mr. A. A. Goodall, surveyor to the Rhyl Urban District Council, has had his salary increased from £220 to £250 for one year.

Mr. W. J. Baker, assistant road foreman at Chelsea, has been appointed highways superintendent to the Watford Urban District Council.

Mr. C. F. Gettings, county surveyor of Worcestershire, has, pending the appointment of a successor to Mr. E. P. Hooley, been asked by the Notts County Council to advise them on certain matters.

Mr. R. M. Chart, sanitary surveyor to the Croydon Rural District Council, has had his salary increased for one month by £105 in consideration of his services in preparing a scheme for remodelling the council's sewage works.

Dr. W. Perrin Morris, chief medical officer, Medical Bureau, Commonwealth of Australia, will on Wednesday, April 28th, deliver before the members of the Royal Sanitary Institute a lecture on "The Evolution of Hygiene and Public Health in Australia." The Earl of Plymouth, president of the institute, will take the chair at 5 p.m.

Mr. W. Thompson, ASSOC.M.INST.C.E., deputy borough engineer and surveyor of Burton-on-Trent, was on Friday last appointed borough surveyor of Mansfield in succession to Mr. T. P. Collinge, who was recently chosen as borough surveyor of Rotherham. Mr. Thompson has been deputy at Burton-on-Trent since 1903, and previously he held appointments at Birkenhead and Newport (Mon.).

Mr. R. J. Whitley, engineer and surveyor to the Bentley-with-Arksey Urban District Council, has been congratulated [illegible] upon becoming an associate member of the Institution of Civil Engineers, the writer adding: "Mr. Whitley has been in Bentley since 1911, and has been responsible for many excellent improvements and additions, rendered necessary by the rapid increase in the population, which is now 13,000 as against 6,000 when he first came to the district."

Mr. Richard P. Hirst, ASSOC.M.INST.C.E., has retired from the position of consulting engineer to the Southport Corporation. Mr. Hirst was appointed assistant surveyor to the Corporation of Southport in June, 1881, out of upwards of 100 candidates. He acted as deputy surveyor to the late Mr. Crabtree, and was acting surveyor during his long illness. In February, 1896, he was formally appointed borough engineer and surveyor by the corporation, from which position, owing to a breakdown in health, he retired in March, 1912, when he was appointed consulting engineer for a period of three years.

Mr. James Snook, highways superintendent and farm manager to the Wimbledon Corporation, died, we regret to state on Sunday morning from pneumonia, after five days' illness. Mr. Snook had been in the service of this district for thirty-six years, having been appointed sewage farm manager by the late Wimbledon Local Board in 1879, at a time when the sewage works and farm were a constant source of trouble to those who lived near, as well as to the local board. Mr. Snook was brought up on the Beddington and Norwood Farms under his father, Mr. James Snook, who was then farm manager to the Croydon Corporation, and afterwards to the Northampton Corporation. No one possessed a more thorough knowledge of irrigation and the preparation of ground than Mr. James Snook, senior, who previous to being engaged on sewage treatment worked on irrigation meadows in Wiltshire. Mr. Snook subsequently laid out various sewage works and farms for Mr. Baldwin Latham, M.INST.C.E. When the Court of Chancery put the Merthyr Tydfil sewage works in the hands of Mr. Bailey Denton, M.INST.C.E., that gentleman placed the management of these works in the hands of Mr. Snook. Previous to his appointment at Wimbledon he was engaged with the late Mr. W. Santo Crimp in laying out the Merton

sewage works and the sewers connected therewith, for Mr. Baldwin Latham. It was not long after Mr. Snook had charge of the Wimbledon sewage farm and works that these undertakings proved so efficient that they received the attention of authorities from all parts, especially as Wimbledon was one of the few places where sewage was treated successfully on clay ground. The sewage works of Merton and Surbiton are in charge of his sons, Henry and Charles Austin. During the time Mr. Snook has been in Wimbledon the population has increased from 13,000 to 59,000, while the length of roads repaired by the local authority has increased from 4 miles to 48½ miles.

Mr. T. P. Frank, borough surveyor of Newark, was on Friday appointed borough surveyor of Stockton in succession to the late Mr. M. H. Sykes, at a salary of £500, rising to £700. From 1899 to 1903 Mr. Frank was engaged in the Huddersfield borough surveyor's department, three years of this time being spent as an articled pupil. In 1903 he was appointed deputy borough surveyor and water engineer of Dewsbury. While holding this office he gave (in 1905) a course of lectures at the Leeds University on "Geodesy," and was also lecturer on "Civil and Municipal Engineering" at the Leeds Central Technical School (1907-8). In 1908 he became city surveyor of Ripon, and from 1912 to the present time he has held the office of borough surveyor and water engineer to the corporation of Newark-on-Trent. It may be noted that Mr. Frank was on the short list for the Mansfield borough engineer and surveyorship, and

Mr. T. P. Frank,
Borough Surveyor of Stockton.

was invited to attend there at the same time as he was asked to appear at Stockton. He is a Fellow of the Surveyors' Institution, associate-member of the Institution of Civil Engineers, a member of the Institution of Municipal and County Engineers, and of the Royal Sanitary Institute, and an associate-member of the Institution of Water Engineers.

Mr. F. W. Bricknell was last week formally appointed, at a salary of £750 a year, city engineer of Hull in succession to Mr. A. E. White, retired. Alderman Larard, who proposed the appointment, paid a high compliment to Mr. Bricknell's ability. For five years he had practically had charge of the city engineer's department. Mr. Bricknell is a native of Leamington, and received his education at Trent College. In 1877 he was articled to Mr. J. Fox Sharp, M.Inst.C.E., then borough engineer of Hull. He was transferred to the salaried staff in 1880, and received promotion from time to time. On the retirement of Mr. Fox Sharp in 1887, and the consequent promotion of Mr. A. E. White, he took Mr. White's place as assistant borough engineer. Hull, it may be stated in passing, had been considered rather a squalid and badly equipped town, but had already made some headway when, about 1898, a progressive movement set in, led by Alderman Larard, who dealt with the purchase and reconstruction of the tramways, and Sir Alfred Gelder, who initiated the wholesale street improvements which were carried out concurrently with the reconstruction of the tramways during the following years. Mr. Bricknell has been engaged in some capacity on most of the important works which were carried out during Mr. White's tenure of office, and latterly was virtually responsible for several sections of the work, including town planning, parks, baths and markets matters, and the reorganisation and equipment of the works department for carrying out scavenging and cartage by direct labour. He has specialised in parks and baths, and was mainly responsible for the three fine sets of baths which the corporation possesses, and for the Pickering Park. He has been an associate-member of the Institution of Civil Engineers since 1886.

A correspondent who is intimately acquainted with the municipal work of Hull writes: "You will be aware that the whole of the main roads in Hull and most of the streets in the centre of the city are paved with wood, and we are very proud of the cleanliness and good condition of our streets. With the laying of the wood paving boys were engaged for street-orderly work, and now number seventy, and since 1902 Mr. Bricknell has been the chairman of a committee for organising these

Mr. F. W. Bricknell,
City Engineer of Hull.

boys on Boys' Brigade lines. The chairman of the Works Committee, Alderman Larard, has very heartily supported Mr. Bricknell in everything for the good of the lads, and the result has been an organisation which has helped to develop manliness and robust character among a class of boys who were greatly in need of care and attention, and who, especially in later years, were chosen because of their poor circumstances and their social disadvantages. Mr. Bricknell never misses the drill night or the Friendly Society, and has given freely of his time, energy and money, and has never flagged in his interest during the whole of the thirteen years he has kept the work going. At the present time a very large number of boys who have been trained by the club are in the Army or Navy, and a good number of them have attained to non-commissioned rank."

OBITUARY.

We deeply regret to have to record the death of Mr. Josiah Smart, senr., senior partner in the well-known firm of Josiah Smart & Son, of London, Matlock, Walsall, and Kettering. Mr. Smart rose to prominence in the business world from small beginnings. Forty-five years ago he went to Hitchin to carry out certain tar-paving work for the Great Northern Railway. He removed to Stevenage some four or five years later, and in 1883 commenced in business for himself as a tar-paving contractor, and, subsequently, as a sand and gravel merchant. He was one of the pioneers of tar macadam paving for roadways, and the firm of which he was the head owes not a little of its prosperity to the special attention which in recent years he gave to the production of that material. Mr. Smart was born at Nottingham in 1836.

Road Work and Military Traffic.—In order that there shall be no interference with military traffic the War Office is asking local authorities to postpone road repairs until the work can be commenced without prejudice to military requirements. On this account the London County Council tramway work at Eltham is to be suspended.

Institution of Municipal and County Engineers.

EAST MIDLAND DISTRICT MEETING AT LOUGHBOROUGH.

A meeting of the East Midland District of the Institution of Municipal and County Engineers was held at Loughborough Town Hall on Saturday last. There was a large attendance of members and visitors, the company including Messrs. L. L. Baldwin (Coalville), P. Bunn (Lichfield), E. W. Burn (Saltburn-by-the-Sea), W. G. Clarke (Wigston), H. G. Cooke (Market Harborough), E. A. Cope (Derby), E. H. Crump (Hinckley), hon. district secretary, W. H. Cust (Leicester), F. P. Cook (Mansfield Woodhouse), F. S. Coburn (Leicester), H. Coleby (Atherstone), S. Douglas (Kenilworth), A. H. Elliott (Carlton), T. W. Gordon (Nottingham), G. H. Hawley (Bastford), J. W. Horton (Derby), F. W. Mann (Leicester), S. Mayo (Basford), E. C. Moorhouse (Melton Mowbray), A. Parker (Oakham), A. J. Rose (Ludlow), P. M. Smith (Leicester), S. Turner (Ashby-de-la-Zouch), A. H. Walker (Loughborough), W. S. Woodcock (Oakham), and E. Wheeler (Eastwood), members; T. Aucott (Hinckley), A. Delkes (Leicester), S. Easey (Leicester), W. Granger (Loughborough), W. Jenkinson (Hinckley), D. Lansdoun (Hinckley), W. Keay (Leicester), G. Moore (Leicester), F. W. Prentice (Loughborough), L. Straw (Carlton), J. Scholes (Leicester), J. Tyron (Leicester), W. Walker (Nuneaton), and T. Wood (Leicester), visitors.

The district chairman, Mr. E. G. Mawbey, of Leicester, was unfortunately unable to be present, being confined to his room by a severe cold, and the chair was therefore taken by Mr. H. G. Cooke, of Market Harborough.

The minutes of the previous meeting at Hinckley having been read and signed, the district secretary explained that it had been his intention to have had the Loughborough meeting earlier in order that the members might have had the opportunity of discussing nominations for the various district offices. This, however, had been found impracticable; therefore the nominations—the ballot papers of which had not been sent out before the meeting—had been made by individual members. Consequently the only district business to transact was the election of a district committee.

ELECTION OF DISTRICT COMMITTEE.

The meeting then proceeded to elect the committee, and the following gentlemen were appointed for the respective counties in the district:—

Nottinghamshire.—Messrs. F. P. Cook (Mansfield Woodhouse), T. Henry (Retford), and T. Gunter (Nottingham).

Leicestershire.—Messrs. A. H. Walker (Loughborough), A. Rose (Ludlow), and W. H. Cust (Leicester).

Lincolnshire.—Messrs. H. G. Whyatt (Grimsby), W. B. Purser (Kesteven), and T. Lake (Bourne).

Derbyshire.—Messrs. J. H. Horton (Derby), V. Smith (Chesterfield), and E. A. Clews (Derby).

The district secretary reported that he had received letters of apology for absence from Messrs. Measures (Leicester), Purser (Kesteven), Henry (Retford), Jeeves (Melton Mowbray), Ryman (Stamford), Frank (Newark), and Penn (Belper), among others.

On the proposition of the chairman a hearty vote of thanks was accorded to his Worship the Mayor and the Corporation of Loughborough for the use of the town hall for the meeting.

The members and visitors proceeded to the public baths, where a demonstration was given of a self-instructing swimming apparatus made by Messrs. Herbert Morris, Limited, of Loughborough, and a representative of this firm thoroughly explained and gave all details in connection with the apparatus.

LOUGHBOROUGH SEWAGE WORKS.

The party then drove to the sewage farm and outfall works, and here a full description of the works was given by the borough engineer, Mr. A. H. Walker, Assoc.M.Inst.C.E., previous to the inspection of the works, which include pumping station, refuse destructor of Messrs. Manlove & Elliott's type—the steam from which is used to pump the sewage—Dortmund tanks and experimental percolating filter-bed made of clinker from the destructor.

Briefly, the treatment of the sewage is as follows:—The sewage is delivered into a pump well at the farm, and thence it is lifted by means of centrifugal pumps into the Dortmund tanks, from which it proceeds on the farm. It then passes into grips, and this method of distribution of the sewage was favourably commented upon by the members. The greater portion of the farm strata is of excellent gravel, and the [illegible] at a depth of about 3 ft. the effluent being collected and passed into the river Soar.

The [illegible] was inspected by the members appeared to be very satisfactory indeed.

The [illegible] Corporation are to be congratulated on having an excellent gravel bed on their farm. A small portion of the farm is of a clayey nature, and, in order to facilitate the treatment of sewage on this, a thickness of destructor clinker was added some years ago, and seems to have had the desired effect.

The percolating bed is of destructor clinker, of [illegible] and the sewage is applied [illegible] Many questions were asked concerning the works, and all required information was readily given by the borough engineer and his staff. The general verdict appeared to be that the farm and works were excellently managed, and that, given a good gravelly subsoil, sewage could be successfully treated by [illegible]

The [illegible] the town hall, where, by the hospitality of Mr. and Mrs. Walker, they were entertained to tea. On the [illegible] of Coalville, a hearty vote of thanks was passed to Mr. and Mrs. Walker for their kindness, and the [illegible]

EASTERN DISTRICT MEETING AT WESTMINSTER.

[illegible] in The Surveyor of March 19th], was concluded on [illegible]—Messrs. E. Willis (Chiswick), A. E. Collins (Norwich), Reginald Brown (Southall-Norwood), W. Gornall (Hendon Rural), D. S. Sutherland (Southgate), H. F. Wilkinson (Tottenham), and J. A. Webb (Hendon Rural), hon. district secretary—put in an appearance, and a quarter of an hour sufficed for the debate to exhaust itself, after which a private discussion ensued on the question of motor traffic. Mr. Reginald Brown was voted to the chair in the absence of the district chairman, Mr. H. T. Wakelam.

At the outset a letter from Mr. Willis on the subject of tarred clinker—commented upon by him at the [illegible] last—was read. In this Mr. Willis said he found the approximate proportions employed in the manufacture of clinker tar-macadam in Chiswick, expressed per cubic yard, were from 9½ to 10 gallons of tar, 39 lb. of pitch, and 26 lb. of blue lias lime. These varied slightly, according to the method of mixing. If the clinker was crushed while [illegible] at once, the tar mixture gave a much better product. Similarly, in hot summer weather the result was more satisfactory. The economy at the works was estimated [illegible] to 1s. per cubic yard upon the above figures, under no-t favourable circumstances.

Mr. Wilkinson stated that in his district they had been putting down concrete on one and two-coat work with foundations of two or three different kinds. In one area two-coat work had been put down in the [illegible] garage, and he was watching the effect of the grinding of the motor 'bus wheels on the road. In regard to the materials used for foundations, he was inclined to think that clinker formed the most resilient foundation. The use of a 7-ton roller for the work had been found to give more satisfactory results than the use of a 10-ton roller, while he had found that petrol was a very destructive agent when it had anything to do with asphalt macadam.

Mr. Brown expressed himself in favour of grading the material for road purposes, believing that the nearer one got the material wholly composed of the wearing material itself, with the least quantity of cementing material, the better the result would be.

In view of what had been said about clinker roads he thought they were really reducing road making to an absurdity. They first of all made up their minds that granite was the only material fit for ordinary roads, water-bound roads, and now they had come to find that clinker was good for certain roads if it were mixed with tar. If tar was going to make all the difference it was about time, he thought, that they, as engineers, started *ab initio* to ascertain what was the best material according to the varying traffic to which the roads would be subjected. If clinker was such an excellent material, why should they go to the expense of 10s. or 12s. a ton for tarred slag, or 18s. or 19s. for granite? The whole thing seemed to lead to the subject of the wearing qualities of tar, which took all the strain instead of the material itself.

Mr. Willis said he had used tarred clinker under 1-in. wearing carpet, and had found it to be the same as when it was put down.

Mr. Webb said he had experimented with various kinds of materials, but the best thing, the most economical and the most lasting, so far as his district was concerned, was ordinary Leicestershire granite, or Clee Hill granite, mixed with Tarvia and laid about 2½in. thick over the road. In some cases he had scarified the road; in others he had filled up the low places before putting on the material. He had subsequently covered it with a thin layer of ¼ in. or ⅜ in. granite chippings, mixed with Tarvia, and then in the summer or spring, when the road was surface-tarred, there was an excellent surface, the voids in the road being very few. He regarded Plascom as a very excellent thing, and had seen some very good results when it had been properly laid; but on a clay soil he did not advocate anything unless it had elastic qualities.

Mr. Collins expressed the opinion that the discussion had been of more practical value than ninety-nine out of a hundred set papers, and he would be glad to see the principle extended.

ARMY SANITATION.

LOCAL AUTHORITIES' GOOD WORK.

The Local Government Board have received from the Army Council a letter in which deep appreciation is expressed of the assistance which local public health authorities, under the guidance of the board, have rendered since the outbreak of war to troops stationed in their administrative areas. The Army Council state that this assistance in the unexampled circumstances of the last eight months has been invaluable in safeguarding the health of the forces, and in preventing the spread of infectious disease to an extent which would have been otherwise impracticable, and the Council are asked to convey to the councils of the counties, boroughs and sanitary districts concerned the thanks of the Army Council for the work thus undertaken. In particular reference is made to the valuable services which have been given by medical officers of health, sanitary inspectors and other officials of the local authorities in co-operating with the army sanitary service.

The Army Council trust that during the coming summer months they may continue to secure the assistance, advice and co-operation of these authorities and their expert officers, under the general supervision of the board's medical inspectors, with a view to maintaining the present favourable record as to disease among troops stationed in camps and billets in the United Kingdom.

Royal Society of Arts.—A paper on "Utilisation of Solar Energy" will be read by Mr. A. S. E. Ackermann, B.SC.(ENG.), ASSOC.M.INST.C.E., at the Royal Society of Arts, John-street, Adelphi, on Wednesday, April 28th, at 8 p.m. This paper will supplement that given before the Society of Engineers in April, 1914, by dealing with the experiments of other workers in the field.

Business Announcement.—Messrs. Summerscales, Limited, Keighley, announce that they have completed the purchase of the goodwill, drawings, patterns, models and all business matters in connection with "Cundall" engines, gas, petrol, oil, spirit and producers, &c. They are removing these to their works at Phœnix Foundry, and purpose manufacturing these engines and gas plants.

DUST PREVENTION.*

By Major W. W Crosby,
Consulting Engineer, Baltimore, Maryland.

General agreement among highway authorities has developed the fact that dust proceeds not only from attrition of the roadway surface by hard tyres and the feet of animals, but also comes from the grinding on each other of fine pieces of aggregate or road metal forming the pavement or crust. This internal wear of the surfacing is much greater than was formerly suspected, and it largely accounts, in many cases, for the layer of mud and dust to be found on macadam, for instance, even when freely removed from the surface at frequent intervals by scraping or sweeping.

The amount of the internally produced mud seems to bear a relation to the weight of the traffic, and to the moisture present—such as results from sprinkling with water—as well as to the friability of the stone used and to the methods of construction.

Heavy vehicles, even when shod with rubber tyres, set up severe strains in the road crust, and tend to make the particles of stone in macadam rub against each other in resisting these strains. If water is present in excess in the mass at the same time the stones wear into mud more easily. Soft materials, of course, produce more fine material than harder ones under the same conditions. If the particles of material composing the macadam are closely knit and mechanically or physically bound together by their angular shapes, they naturally move less under the strains, and the rubbing and consequent fine material produced is less in amount.

Real dust prevention, it will be seen, begins, therefore, with the construction of the road crust. In this work it will be necessary to avoid, as far as practicable, the subsequent production of both superficial and internal dust, which latter rises eventually to the surface, and becomes appreciable externally—selecting road metal of the most appropriate hardness considering the traffic, by providing thorough proper drainage against the continued presence of an excess of water in the road crust, and by securing the firmest angular bond that the metal is capable of in the macadam.

EXCESS OF FINE MATERIAL.

It has been found that, even where good road metal was used, and under light traffic, road crusts built with the use of an excess of fine material in their first construction have proved to be subsequently more dusty under the same conditions than where the fine material used was kept to a minimum. Evidently the excess of fine material, not only from its presence easily furnished more dust to be raised, but also it prevented the closest interlocking of the coarser particles. This resulted in an increased movement of them under strains on the surface, and therefore the production of more internal dust. The dustiest kind of a stoned roadway is an old turnpike, where the stones were liberally mixed with earth in order to help their compaction under traffic, and where they are bedded, like plums in a pudding, in a matrix of fine material.

With modern machinery and the construction of the macadam by sufficient rolling, the use of fine material should always be kept as low as possible. It will have to be used, to some extent, for filling the voids between the coarser particles; but even then a selection for the finer particles should be made, and, as far as practicable, that chosen should be highly resistant to the tendencies toward its reduction to dust. It will pay in using limestone to use at least 50 per cent of the fine material required for bonding the macadam of clean sand such as would be suitable for mortar. In many cases all the fine material necessary may profitably be such sand even when used with crushed trap rock, and with shells no fine material, except such sand, should ever be used. In no case are the best results ever obtained by the use of clay, silt or loam for binding macadam. A further reduction in the quantity of fine material used in filling the voids of macadam is possible by the use of bituminous material for this purpose, and this "pitch" has also another effect referred to later.

No matter how built, a roadway, even in city streets, may become superficially dusty, and the suppression of the dust on its surface from becoming objectionable may be desirable. Frequent cleaning or removal of

* Paper presented at second International Good Roads Convention at Toronto on March 24th.

the dust with the dirt may solve the problem, or it may be unpracticable to that extent, and other means of relief may be necessary.

WATER AS A DUST LAYER.

The simplest of these is sprinkling with water to "lay the dust." The objections to this are that it is seldom done efficiently, because it has to be done periodically, and between the times of sprinkling, when a temporary excess of water is applied, the surface condition varies from muddy to dusty again; further, the cost of sprinkling with water may not be economical if that is the sole reliance for the suppression of the dust. Proper cleaning, with sprinkling or washing of the street surface, may, under some city conditions, be satisfactory.

Efforts have been made to increase the effectiveness of water sprinkling by the use of sea water, which contains hygroscopic salts, or by the addition of such salts as calcium chloride to the water. Under some conditions the results have seemed to be successful to a certain extent. These salts absorb moisture from the air, and tend to keep the roadway surface moist enough to hold down the dust even after the water originally applied with them would otherwise have disappeared and failed to do this. Their effect, however, is not permanent, nor is it powerful enough to meet severe conditions of traffic tending to produce or raise dust; further, these salts are soluble, and are washed away to the gutters and water-courses by rain. Their re-application becomes necessary at intervals more or less frequent according to local conditions.

The salt (calcium chloride) itself has been used on the same principles by being spread in a finely divided and dry state over the roadway surface. In this way the effects of it are, perhaps, stronger, and more noticeable or lasting.

GLUTRIN.

Another what might be called "chemical" process consists of the use of concentrated sulphite liquor usually produced as a waste or by-product at wood-pulp mills, and commercially known as Glutrin. The Glutrin is used either with or without the addition of water. The effects of the Glutrin are composite. It has some cementing powers, such as exists with sugar. It also, through its tannic acid content, has a chemical effect on some of the materials composing the road crust, which tends, perhaps, to strengthen their normal binding power. For instance, it may make a clay much more plastic and tenacious; further, road surfaces treated with Glutrin seem to "set up harder, and, to some extent, to resist abrasion better.

The Glutrin is, however, more or less soluble in water, and eventually will be washed out of the road crust, even if the impregnation is fairly deep, as subsequent wetting of the crust brings the Glutrin gradually to the surface. Under some conditions the use of Glutrin as a dust preventive has been fairly successful.

BITUMINOUS MATERIALS.

The most successful of the materials used for either the prevention or suppression of dust on roadways are the bituminous materials, and they can generally be used for both purposes.

If the voids in the road metal are, for instance, filled with bituminous material, the internal production of dust is prevented. The external production of dust even may also be reduced because of the cushioning effect of the pitchy matrix and the greater resiliency, thus given the piece of road metal subjected to the shock or attrition of traffic. If the bituminous material is only applied to the surface of the road crust, it still reduces the dust nuisance by suppressing the raising of the dust underneath or mixed with it, and in many cases by protecting the road metal from any superficial wear from traffic.

Further, a proper bituminous material possesses to a large degree, and greater than in the cases of other materials, the ability to absorb a considerable amount of dust produced elsewhere, and, perhaps, brought on to the roadway through various agencies. This is important from the economic point of view.

What is a "proper" bituminous material will depend so largely, in any case, upon the local conditions that no close definitions can be given in this paper. Perhaps it might be said that, generally speaking, the asphaltic oils are better for this work than the paraffin base oils, that a good bituminous dust layer will give benefits other than the mere reduction of dustiness on the roadway—such, for instance, as the reduction of noisiness and an increase in sanitariness—and that usually its proper application will be in the interests of both economy and general satisfaction.

On the other hand, the improper use of an unsuitable bituminous material will produce results on the roadway second to none as far as nastiness and general dissatisfaction are concerned.

Roads Improvement Association.—The twenty-eighth annual general meeting of the Roads Improvement Association will be held at the Institution of Civil Engineers, Westminster, London, S.W., on Thursday, April 22, 1915, at 4 p.m. precisely. In the absence of the president, H.R.H. Prince Arthur of Connaught, who is on active service, the chair will be occupied by the Hon. Arthur Stanley, M.V.O., M.P.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr J. S. PICKERING, M.INST.C.E., Borough Surveyor and Water Engineer, Cheltenham.

METROPOLITAN DISTRICT MEETING.

At a Metropolitan District meeting to be held at 92 Victoria-street, Westminster, on April 30th, at 7.30 p.m., a discussion will take place on "The Heavy Traffic Problems of London."

Members in Greater London are specially invited.

SCARBOROUGH MEETING.

An institution meeting will be held in the North-Eastern District at Scarborough on Saturday, May 8th.

PROGRAMME.

10 a.m.—Assemble at the town hall.

10.15 a.m.—Reception by his Worship the Mayor (Mr. C. C. Graham). A paper entitled "Catering for the Wants of the Holiday-maker," by Mr. Harry W. Smith, ASSOC.M.INST.C.E., borough engineer and surveyor, will be taken as read. Any discussion thereon may take place at the close of the meeting after the various works have been inspected.

10.15 a.m.—Inspection of Spa improvements, beach bungalows, South Cliff Gardens, bathing pool, &c., in the South Bay.

1 p.m.—Lunch at the Grand Hotel. (Tickets, 3s. each.)

2 p.m.—Meeting of the members of the North-Eastern District to consider—

(*a*) The report of the Executive Committee as to the desirability of reporting the proceedings of district meetings in the Press.

(*b*) Any other business.

2.30 p.m.—Leave the Grand Hotel by char-à-banc (tickets 2s. each) for the Castle Hill, to view the damage caused by the bombardment on December 16, 1914, by the German battleships, and to inspect the Keep.

3.15 p.m.—Leave the Castle Hill, and inspect the Alexandra Gardens, Floral Hall, Peasholm Park, and the beach bungalows and bathing establishment in the North Bay.

4.30 p.m.—Leave the north end of the Royal Albert-drive by motor char-à-banc for drive along the Marine-drive, Valley Park, to the Mere.

5.15 p.m.—Afternoon tea at the town hall by the kind invitation of his Worship the Mayor (Mr. C. C. Graham).

AYR MEETING.

At the Scottish District annual meeting to be held at Ayr on June 2nd and 3rd, papers on town planning, municipal housing, road work, and scraping of water mains will be submitted.

On the first day visits will be paid to the municipal works of the town, and the following day will be devoted to inspections of experimental road stretches in Ayr County, and Hillhouse Quarry, and to a visit to Loch Doon.

MATLOCK MEETING.

The arrangements for the institution meeting to be held at Matlock on June 12th include visits to the new sewage works, the Lime and electric baths, and other undertakings.

J. W. DUDLEY ROBINSON,
Secretary

92 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. W. H. Matthews Jones, City Engineer and Surveyor, Chester.

NORTH-EASTERN AND EASTERN DISTRICTS.

A meeting of the North-Eastern and Eastern Districts of the institution will be held at Newark-on-Trent on Saturday, April 24th.

1.45 p.m.—Meet at the Saracen's Head Hotel, and proceed to the town hall.

2 p.m.—Welcome at the town hall by his Worship the Mayor, Mr. J. C. Kew.

2.30 p.m.—Proceed to inspection of old castle ruins. En route Ossington Coffee Palace, Trent Bridge and free library will be pointed out.
Parish church (exterior and interior). A short organ recital will be given by Mr. W. F. Wright, A.R.C.O., organist.
Old Magnus Buildings, with Tudor Hall, recently restored at a cost of £2,000 by Mr. H. W. Lockton, M.S.A. (member).
Various old buildings in Market-place.
Beaumond Cross.
New Magnus Grammar School (by the kindness of the Rev. H. Gorse, M.A., head master), designed by Mr. Lockton, and carried out at a cost of over £10,000.

5 p.m.—High tea at the Saracen's Head Hotel, at a cost of 2s. 6d. per head.
Short descriptive notes of the visits will be given by Mr. Lockton, and by Mr. P. A. Watford (member), surveyor, Claypole Rural District Council.

Members of the Yorkshire and other districts are invited to attend.

G. Belson Chilvers,
Hon. District Secretary.

Oundle, Northants.

SOUTHERN AND SOUTH-EASTERN DISTRICTS.

A visit will be paid on Saturday, April 24th, to the New County Hall Works of the London County Council.

Members will meet on the site of the works, Belvedere-road, Westminster Bridge, at 2.30.

The contract now in progress embraces roughly some three-fourths of the complete building (the northern blocks being not yet commenced), and the bulk of the work is at about second floor level.

Members contemplating attendance are requested to send me a card.

Arthur Palmer,
Hon. District Secretary.

Town Hall,
Greenwich.

Glendevon Water Supply Scheme.—The Dunfermline District Committee have let the contract for the construction of the new reservoir at Glendevon to Messrs. P. & W. Anderson, of Glasgow. The contract price for the work, which also includes the formation of a road of access and the erection of the necessary fencing, is £97,000.

Oldham Destructor Works Extensions. The members of the Oldham Corporation Surveyor's and Buildings Committee inspected recently the extensions effected at the Rhodes Bank destructor works, which have been completed. Some time ago the committee decided to erect four new destructor cells, with a view to preventing the tipping of refuse on tips, and to meet the increased collection in the central district of the borough; also to enable the destructor flues to be more frequently cleaned owing to the dusty nature of the refuse collected from ash cans. These cells are now completed, and working satisfactorily. The destructor is on the latest Horsfall patent system, and comprises four back-feed cells, having a total capacity of 50 tons per day, Lancashire boiler, dust catcher, and flues connected to the old electricity works chimney, together with forced-draught apparatus and steam engine installed in the basement under the destructor. The whole of the ironwork and machinery for the cells were obtained from the New Destructor Company, Limited, who are the present owners of the Horsfall concern. The brickwork of the furnace, flues and boiler setting, and the construction of the buildings has been carried out by the borough surveyor's department, the contractor being Mr. Edward Stephenson, Union-street West, Oldham.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. The Surveyor

And Municipal and County Engineer.

Vol. XLVII. APRIL 23, 1915. No. 1,214.

Minutes of Proceedings.

Town Planning in Built-up Areas.

At a meeting of the Town Planning Institute held on Friday last, two very interesting papers on "Replanning and Reconstruction in Existing Centres" were read. The first paper was presented by Mr. W. J. Lancashire, M.INST.C.E., the city engineer of Leeds—a city which has had a very full experience of the improvements expense which inevitably attends the comprehensive attempts to grapple with the errors of the past in regard to city development. Although a large part of Mr. Lancashire's paper was occupied with a narrative of some of the large improvements which have been effected at Leeds under his supervision, many of his observations in regard to the widening and improvement of streets, the rebuilding of old areas of towns, and the clearing of unhealthy areas were of general interest. The enormous growth of Leeds, like that of many other towns, was primarily due to the great industrial revival of the nineteenth century. In 1801 the population was only 53,162, but with an average increase during each succeeding decade of 35,660, the estimated present population is no less than 465,000. This rapid increase appears to have taken place without regard to any comprehensive plan or design, with the result that the citizens of to-day are faced with a very great, though necessary, expenditure for the improvement of travelling facilities and the clearance of slum areas. Mr. Lancashire gave some striking figures to illustrate the costliness of the shortsighted policy of the past. Putting first things first, he pointed out that the cost in human life has been almost incalculable. For example, the death-rate in the York-street area was as high as 39·16 per 1,000 in 1893-5, as compared with a death-rate for the whole city of 20·26, while in the Quarry-hill area the respective rates were 28 and 19·8. The annual cost to the city of improving these two areas represents a rate of about 4d. in the £ at the present time, and the expenditure is not yet complete. It will be seen, therefore, that even when the proceeds of the sale of surplus lands are taken into consideration as a credit, the nett cost to the city on final completion will be very heavy.

It is, of course, impossible to say how much of this might have been saved by prudence and foresight, and in these as in other matters it is easy to be wise after the event. It, however, the present generation has to suffer for the mistakes of the past, it can at least profit by the experience and take every care not to repeat the errors. And herein lies the force of Mr Lancashire's [illegible] that a replanning scheme will [illegible] which are forced to the front when a general and comprehensive view is taken of the problem of [illegible] in the place apparently desirable that each municipality should have its plan indicating the improvements to be carried out as time, opportunity, and money allow. Before leaving this paper we may perhaps refer to one matter of detail. In the remodelling of a central area—or indeed in the execution of a comparatively simple street improvement—considerable expense is invariably incurred in the disturbance of cables and pipes. It is therefore interesting to observe that [illegible] sewages of a length of about 2,177 yds. have already been constructed to accommodate gas, water, electricity and other mains and services.

The other paper to which we referred above was from the pen of Mr. H. V. Lanchester, [illegible] and is interesting to note that in speaking of Indian experience, the essential factors of the problem were the same as in this country. This is exemplified by the preparation of a general comprehensive improvement plan as against the method of dealing with improvements in isolated instalments. Further, two of the primary considerations [illegible] were those of health and traffic. The problem of health is even more difficult in India than it is here, for although we are told that in many respects the inhabitants of India are cleanly and methodical in their habits, we know that in others they are quite the reverse. Moreover, the crowding of an area with badly built houses inevitably facilitates epidemics of plague, a disease which it is well known is transmitted by rats. Both papers showed that the administrators of the present, if they are wise, will profit by the mistakes of the past, and, by wise expenditure and the exercise of foresight, lay a better and surer foundation for the future well-being of city dwellers.

Reports on Dublin Housing.

The Housing Committee of the Dublin Corporation have received from a sub-committee a report upon certain recommendations submitted last year by Mr. Raymond Unwin and Professor Patrick Geddes on the subject of the housing of the working-class population of the city. The gentlemen named had made a number of far-reaching proposals from the town planning point of view, their main recommendation with respect to housing being that the corporation should

acquire land on the outskirts of the city area and build there working-class dwellings of reasonable accommodation, provided with gardens. Other suggestions included a series of street improvements and the clearing of congested areas behind main streets so as to improve the condition of the buildings fronting upon those streets, the provision of playgrounds, and the development of land for building purposes, with the minimum account of expenditure in street works, by the planning of squares of houses accessible from the existing main roads by means of footpaths or inexpensive carriage drives. The sub-committee, while accepting with gratitude the report of the experts for what it is worth, candidly confess their disappointment at its lack of information with respect to certain outstanding considerations that appeal to them—namely, the specific economic advantages regarding the lay-out of the clearance schemes which were before the Dublin Town Council, and detailed plans of more roomy dwellings for the same price as was estimated for those which the Housing Committee proposed to provide. The sub-committee also point out that, as regards the opening up of new connections, this had been anticipated at the recent official inquiry by the borough surveyor, who, upon Mr. P. C. Cowan, the Local Government Board inspector, indicating how necessary it was, stated that in future he would see the survey of each site in the initial stage, so as to make provision for such eventualities.

There is certainly a curiously negative quality about the comments of Mr. Unwin and Professor Geddes which did not escape the attention of the sub-committee. "We recognise," they state, "that a considerable proportion of the population of Dublin, owing to their exceedingly low wages, must be housed in the central areas of the town, and in houses of low rental, but we submit that the best policy to adopt in order to help these people is to remove to better houses built on cheaper virgin soil on the outer areas within the city boundary the very considerable number who could and, if they had the chance, would live there." The sub-committee proceed to point out that practically the most serious problem of Dublin housing is concerned not so much with the economic tenant as with the uneconomic or poverty class, who cannot afford to pay 6s. 6d. a week rent and tram fares to and from the outer areas of the city. The subject will doubtless receive further consideration at the hands of the town council, but meanwhile it is permissible to suggest that its treatment by Mr. Raymond Unwin and Professor Geddes will have served a useful purpose if only it helps to bring into bold relief the contention of the sub-committee that, as regards housing, Dublin cannot be considered as similarly circumstanced to an industrial English city.

The Corrosion of Iron.

It is quite within the bounds of possibility that at some time in the future the corrosion of the interior and exterior surfaces of water mains will be absolutely prevented on all good work as a matter of course. That such corrosion can be prevented is proved by the instances in which scientific advice has been properly followed with good results. Unfortunately there are a much larger number of instances in which no attention has been given to the matter of corrosion at all, or in which the advice of the expert has been partly or entirely ignored, the result being that in the vast majority of cases considered as a whole immense sums have to be spent annually on maintaining systems owing to the effects of corrosion.

Mr. W. J. E. Binnie has done excellent work in once again bringing this subject forward for discussion in a valuable paper read before the Institute of Sanitary Engineers and given elsewhere in these pages. The paper deals with the subject very fully, discussing the various theories of corrosion and indicating some of the possible means of prevention. Seeing that most waters attack iron pipes, owing to the solvent action of the dissolved carbonic acid and oxygen, Mr. Binnie is in favour of the de-aëration of water entering mains under certain conditions. This interesting and apparently simple method does not appear to have received hitherto the trial it deserves. The author tells us that this process was recommended for the treatment of the water in the Kalgoorlie main—350 miles in length and 30 in. in diameter—which gave great trouble clearly because the advice of the experts had not been followed. It is evident that the corrosion of this main and the subsequent troubles might have been entirely prevented if in the first place the pipes had not been brought into contact with earth of a corrosive character on the outside and with water of a corrosive character on the inside. When only part of the advice given by the author's firm was followed, the internal corrosion almost ceased. The simple addition of three grains of lime per gallon effected the change in this particular water, and there can be no reason to doubt that if the advice of the experts had been followed in its entirety the corrosion would have ceased absolutely.

All experience tends to show that the laying of pipe mains is not the simple business that has sometimes been imagined. The nature of the soil, the quality of the water, the quality of the cast iron, wrought iron, or steel of which the pipes are made, and the protective coating, have each to be considered, and probably the most important of these is the quality of the water and the particular treatment required to render it non-corrosive. These are not matters which can be left to the ignorant. If they are not dealt with by the expert the usual troubles due to corrosion are likely to occur. It is time that the fact should be grasped that such troubles, with their attendant waste of money, are preventible, and ought to be prevented in all cases.

British Standard Specification for Portland Cement.

A new edition of the British Standard Specification for Portland Cement, one of the most widely adopted of the reports issued by the Engineering Standards Committee, has just appeared.* The Sectional Committee on Cement, presided over by Sir William Matthews, K.C.M.G., was formed in 1903, and the first report was approved by the Main Engineering Standards Committee and issued in 1904. The specification has been revised from time to time with a view of improvement in the quality of the cement, and the new edition just published contains further important modifications. Increased fineness of grinding of cement has been legislated for, and the minimum tensile strength at seven days of both neat cement and cement and sand has been raised. The clauses dealing with the preparation of the briquettes have been amplified, the procedure being described in greater detail than has previously been the case. In the case of both neat cement briquettes and cement and sand briquettes ramming or hammering is expressly prohibited.

The growth of tensile strength at twenty-eight days, both for neat cement and cement and sand, is now given in the form of a formula in place of the fixed percentages which have been specified

* Price 5s. nett.

hitherto. While not making any material alterations to the figures previously laid down for the growth of the tensile strength at twenty-eight days over that at seven days, the formula gives a progressive increase instead of the somewhat irregular steps of the method previously adopted, and for use in the test house lends itself to the construction of a curve from which the breaking strength at twenty-eight days corresponding to any ascertained breaking strength at seven days could readily be read off. With the view of making easier the determination of what constitutes a visible impression in the test for final setting time, the Vicat needle for this test is provided with a fixed metal circular cutting edge set half a millimetre back from the point, as this length is sufficient to clear the scum which sometimes forms on the surface of the pat. The cement is considered to be finally set when the needle makes an impression on the pat and the attachment fails to do so. All the plates have been entirely redrawn, and two new plates have been added to the specification, one of the latter dealing with a standard spatula for use in making up the cement and sand briquettes, and the other showing an improved form of specific gravity bottle which the committee have approved as suitable for use, though they do not stipulate for its employment to the exclusion of any other pattern. Instructions for obtaining the specific gravity of cement are given on the plate.

* * *

Domestic Electricity.

When it is remembered that until a few years ago the use of electricity for the purposes of heating and cooking was generally considered as a luxury beyond the reach of all except the wealthy class, it will be apparent that enormous strides have been made recently in the development of the industry in this direction. At the present time it is commonly said that the use of current for household and domestic requirements opens up one of the largest fields for enterprise for the immediate future. The great commercial possibilities of the situation are shown by the fact that many large cooking installations have been made in restaurants, while the electric heating of bedrooms in hotels becomes more common. It appears, therefore, that in dealing with the subject of "Electrical Heating and Cooking Apparatus" in a paper which he read recently before the Junior Institution of Engineers, Mr. Stanley M. Hills, A.M.I.E.E., was concerned with a matter of immediate practical importance. He pointed out that the renewed competitive energy displayed by gas companies on the introduction of the incandescent gas mantle has led electricity supply authorities to look for fresh fields of demand as a means of increasing their total output. In order that the domestic demand may be fully developed, three things appear to be essential. In the first place current must be cheap—so cheap indeed that the consumer can afford to waste it. Next, the apparatus and utensils must be both good in quality and simple in use. Mr. Hills observes that if more supply authorities offered electrical energy at a halfpenny a unit for cooking purposes, the demand for cookers and heaters would be considerably increased, with the result that the manufacturers could afford to supply better articles at the current prices or thereabouts. Finally, consideration should be given to the ignorance of the ordinary householder in regard to electrical apparatus, and he should be assisted by an occasional visit from an inspector or instructor. Many a difficulty and groundless complaint would thus be avoided, and the best advertisement—namely, satisfied customers—would be obtained.

Testing Materials.

Among the subjects dealt with in the presidential address which Dr. W. Cawthorne Unwin delivered on Friday evening last before the Institution of Mechanical Engineers, was that of the testing of the materials of engineering construction. Upon such a topic, few men can speak with greater authority. He pointed out that whereas half a century ago most materials of construction were selected and bought on the reputation of the manufacturer, at the present time hardly any material in large use is accepted without special testing in the interests of the purchaser. Even so, many of the tests in ordinary use are of quite an arbitrary character, and do not imitate the conditions of actual service. For example, as Dr. Unwin reminded his hearers, we test specimens of steel to destruction and measure ductility by plastic deformation, though in use the stresses do not exceed the elastic limit and the deformation is elastic. Again, we test cement in tension and use it in compression. All this shows the necessity for constant intelligent criticism of existing methods and for keeping an open mind with regard to possible improvements in method. One reform which may at once be advocated is the establishment of public laboratories, supported by the State, where anyone can have tests made, at moderate fixed rates, by a trained scientific staff, and with great accuracy. Such laboratories are in existence both in the United States and Germany, in both of which countries their work has been found to be of the greatest value. They have the advantage over private laboratories that they are under the direction of experts of exceptional experience and reputation, and are able to pursue investigation, continued often for long periods, beyond immediate requirements into fruitful by-paths. Moreover, results may be published freely, so far as is compatible with the maintenance of the private interests involved.

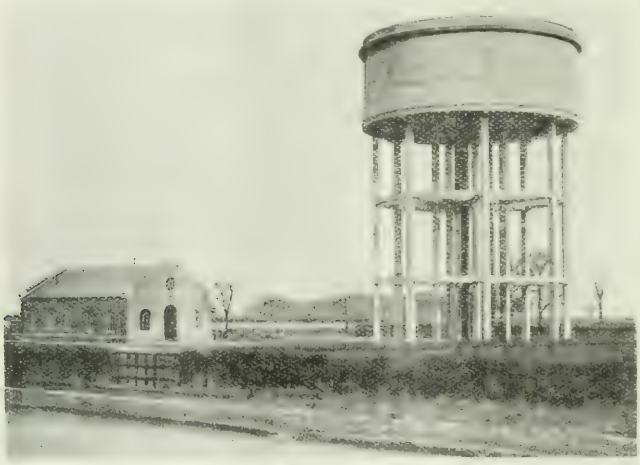
Munitions and Municipalities.

Apparently the idea of appealing to local authorities to release employees so that they can be transferred to the nation's service to assist in manufacturing munitions of war is proving an unqualified success. Everywhere there are indications that the most willing responses are being made. At Darlington, for instance, Mr. Bicknell, of the Local Government Board, stated on Saturday that in eight different centres he had visited he had been promised every assistance. In Cardiff alone 2,000 men are available, in Birmingham well over 1,000, in Leeds 750, in Leicester 400, in Bolton 150. In Newcastle, to take but another example, the Government is asking for 500 employees. Apply such figures all over the kingdom and it will be seen that the assistance obtained will be splendid. Practically it is universal, though we have seen one reported case where an authority held that "the matter did not apply" to its particular district. It is difficult to see how any area in England can claim exemption from its patriotic (and by no means disinterested) duty to share in providing for its own continued freedom from alien rule, and this was the view naturally taken by the Local Government Board inspector who visited the council's offices, for he selected twelve of its employees for possible use. We gather that in such selections preference is given to those who are not concerned with the work of sanitation. The roads may suffer for a time, but even if these be unpatched and unswept no one can reasonably cavil under the circumstances. "Shells, and yet more shells" is the clarion call which is now the loudest in the land.

Thorne and District Waterworks.

By F. GRAHAM FAIRBANK, M.INST.C.E.

For many years before the completion of the undertaking briefly described in the present article,* the town of Thorne, in the south-eastern portion of the West Riding of Yorkshire, was under the reproach of drawing the bulk of its drinking water from the Keadby and Doncaster Canal, and from shallow wells which were affected by the rainfall and heavily impregnated with impurities. The other towns in the district derived their supplies of drinking water chiefly from shallow wells. These sources of supply have been characterised as unsatisfactory for over thirty years by various authorities.



Pumping Station and Water Tower at Hatfield, near Doncaster.

In view of the large increase of population in Thorne and the surrounding districts, a number of local residents promoted the Thorne and District Water Act, in the year 1910, with the object of placing the water supplies of the district on a thoroughly satisfactory basis, and, as the rural district council felt that their hands were already sufficiently full with a large drainage scheme and other works for the purpose of meeting the large increase in population brought into the district by the development of the coal workings, a public company was formed to carry out the waterworks undertaking. The area to be supplied covers about 37 square miles in all.

In obtaining the Act the promoters obtained a report from their engineers, Messrs. Fairbank & Son, M.INST.C.E., of York, as to the best method of supplying the district with water, the measures then recommended being, briefly, as follows:—

(1) To sink a well and borehole, and construct a pumping station at Hatfield, near Doncaster.

(2) To utilise this pumping station to supply Hatfield and Thorne, with extensions, if required, to Stainforth and Fishlake.

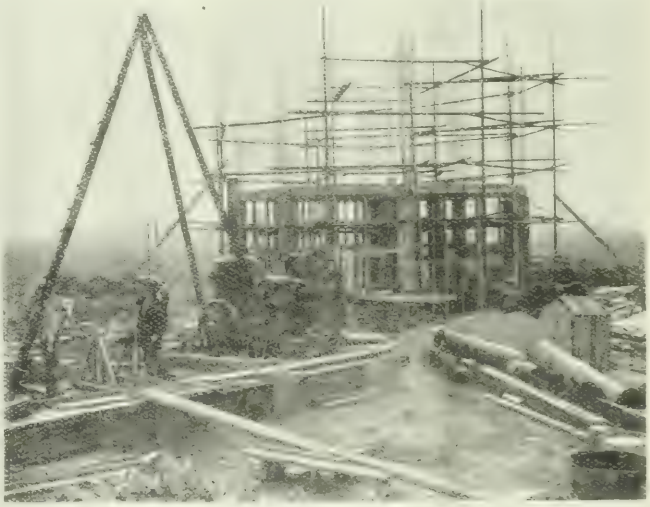
(3) To construct a second pumping station at Thorne, when necessary, for the supply of additional consumers.

(4) To make the delivery main between Thorne and Hatfield large enough to work both ways, so that each pumping unit may be capable of helping the other in the future.

Having sunk a well at Hatfield, an abundant supply of good water was encountered, and, in accordance with the advice of their engineers, the company decided to confine operations at the outset to the supply of Hatfield and Thorne only, while making the well and bores, machinery and water-storage reservoir of sufficient dimensions and capacity to supply Fishlake and Stainforth later.

The contract for the foregoing works was let to Messrs. Parker & Sharp, of York, and the reservoir, which consists of a ferro-concrete tower surmounted by an elevated storage tank with a capacity of 150,000 gallons, was constructed by the Yorkshire Hennebique Contracting Company, Limited, of Leeds.

One of the most interesting features connected with the execution of the works was the laying of a set of duplicate mains beneath the waters of the canal, which was duly laid near the swing bridge at Thorne. A special trench was made in the bed of the canal for the reception of the water company's mains. Two lengths of duplicate mains, each 80 ft. long, were fixed together on the surface. Powerful cranes then lifted these until the pipes, which had been bent and clamped to fit into the channel prepared for them, extended over the water. On the word being given the pipes were lowered to a depth of some 13 ft. or 14 ft. below the surface of the water and fixed in position, the ends on either side of the canal being linked up with the mains running to Hatfield and Thorne respectively. Concrete was then deposited under water over the mains to consolidate and protect the work.



Hatfield Water Tower under Construction.

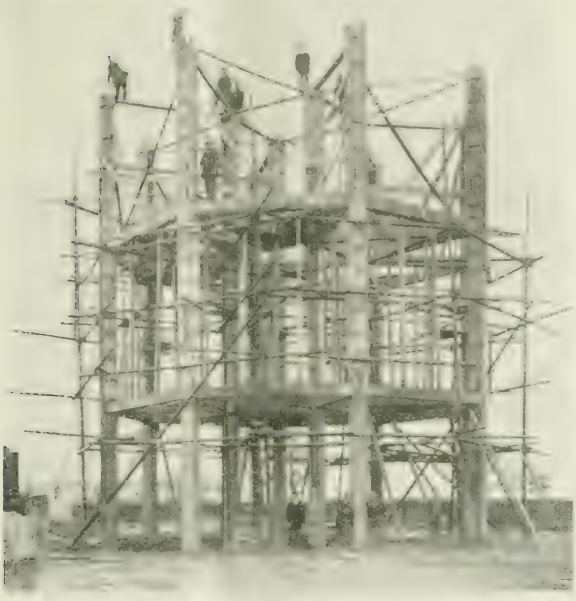
* Reproduced from the April Issue of *Ferro-Concrete*.

The mains passing under the canal are carried in duplicate valves so that if one main goes wrong there will always be another to fall back upon.

The water supply is derived from two boreholes at Hatfield. Each is 9in. in diameter, sunk into the gravel and chalk. The pumping station is the orthodox and plant to the water tower as shown by the photograph superheated, and water is pumped directly into the storage tank, whence it flows by gravitation through a 7in. diameter cast-iron main to the mains at Hatfield and Thorne.

The engine-house is constructed of brick with a slated roof. The pumping plant consists of two 18-b.h.p. Campbell type gas engines, and the power is supplied by duplicate suction-gas plants. The pumps are two-throw, of the horizontal type, and each has a capacity of 5000 gallons per hour.

The water tank is an interesting structure, and forms a dept. of 15ft. The steel work is designed to take [illegible] gallons. In the centre of the tank is a steel cylinder [illegible] compartments [illegible] the



Hatfield Water Tower Erecting for Reinforced Concrete Construction

supply to be kept up to the two towns during such times as the tank is being cleaned out, or emptied for any other purpose.

The bottom of the tank is 40ft. above the surface of the ground, the supporting tower, as well as the tank, having been constructed in Mouchel-Hennebique ferro-concrete in accordance with working details prepared for the engineers by Messrs. L. G. Mouchel & Partners, of Westminster. The ferro-concrete columns are carried down to the solid rock, and to provide means of access to the covered top of the tank a ladder is carried through the centre in a cylindrical tube concentric with the two water storage compartments. All inlet and outlet pipes connected with the tanks are provided with special expansion joints.

The whole of the work was executed by the contractors in a highly satisfactory manner, and the new waterworks undertaking has been in operation for the last eighteen months, the excellent quality of the water and the general efficiency of the services having been much appreciated throughout the district.

Surveyors' Institution.—An ordinary general meeting will be held in the Lecture Hall of the institution on Monday next, when the adjourned discussion on the papers delivered by Mr. C. S. Joseph and Mr. R. Strachan Gardner (Fellow), on "The Report of the Land Inquiry Committee on Housing," will be re-opened by Mr. W. E. Riley, architect of the London County Council. The chair will be taken at 8 o'clock.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

ELECTION OF COUNCIL: COLONIAL HON. DISTRICT SECRETARY'S COMPLAINT.

Mr. T. W. Stainthorpe, hon. secretary (pro tem.) of the African District of the Institution of Municipal and County Engineers, has addressed the following [illegible] that body.

272 Union Buildings,
Pretoria.
March 21, 1914.

[illegible] Election of Council, etc.

Dear Sir,—Yours of February 13th to hand, with ballot paper for the annual election of council, which I received on March 27th.

With regard to the meeting I am arranging for, it [illegible] August at Johannesburg, and I am anxious that it should be a great success, worthy of the institution and of the "Golden City" on the Rand. As requested, I will arrange to have a report of the meeting forwarded [illegible]

I desire to draw your attention to the fact that I received the ballot paper here fifteen days after the [illegible] was supposed to be [illegible] in London. This spells disfranchisement for all our South African members, to say nothing of apparently being somewhat ignored by such a farcical and foolish arrangement. Such business methods cause one to gasp and to wonder when we may expect a little more intelligence and recognition under the new [illegible]

I also would like some information about what seems a very irregular and hole-and-corner examination, which, I am informed, has been recently held at Port Elizabeth. Kindly supply me with the facts of this alleged affair.

As a member of over thirty years' standing, and who has laboured several years to raise the professional status of the municipal engineer in South Africa, by examinations and other available means within my cable-tow, I strongly and emphatically protest against this slipshod and unfair method of treating our South African members. It is true we are not numerically strong, but we are "doing our bit" in the Empire (in many cases under arduous and difficult conditions), and it is up to the council to see that we in South Africa who are members of the institution receive both justice and courtesy, and not any more be asked to waste our time in filling up ballot papers which are due to be returned to you in London fifteen days before we can possibly receive them by mail!

Please lay this letter before the next meeting of the council, to whom I would respectfully appeal to give it their immediate consideration. I deeply regret to have to write so plainly, but I feel it my duty to do so in the true and future interest of the institution in South Africa. Failing a satisfactory reply, I shall back it up by severing my connection with the institution, which I shall be pained to do, after my long and pleasant experience with it.—Yours faithfully,

T. W. Stainthorpe,
Hon. Sec. (pro tem.), African District.

J. W. Robinson, Esq., Secretary,
Institution of Municipal and County Engineers.
92 Victoria-street, London, S.W.

P.S.—I am sending a copy of this letter for publication in England.—T. W. S.

National Road Exhibition.—This exhibition, organised by the County Councils Association, will be formally opened on June 25th by the President of the Local Government Board

Corrosion of Iron and Steel.*

By W. J. E. BINNIE, M.Inst.C.E., F.G.S.

It is not proposed to dwell at any length upon the economic side of the question, as the immense annual sums which have to be spent on maintaining iron and steel structures where exposed to corrosive influences must be well known to the members of the Institute of Sanitary Engineers. In addition to the question of maintenance, the actual capital cost of many structures is increased owing to the impossibility of gaining access for the purpose of maintenance. The author's professional experience has largely been gained in connection with waterworks; he will refer more particularly to this branch of engineering.

A water main can be taken as a very good example of the class of structure where access cannot be obtained for the purpose of maintenance. Pipes are generally of too small a diameter to allow of access to the interior, and are generally buried in the ground, which renders access to the exterior both difficult and costly. Even when the pipes are large enough to allow a man to enter, the exigencies of the water service seldom permit of their isolation for that purpose.

In the case of cast-iron water mains the actual corrosion, when it does occur, is not of great importance in reducing the actual strength of the pipe, except under exceptional circumstances. This is due to the fact that a very large factor of safety must of necessity be employed when using cast-iron subjected to tension due to the internal pressure of the water.

External corrosion of cast-iron pipes is therefore only important under exceptional conditions; but the effect of internal corrosion is very serious owing to the nodular incrustations which appear as the result of this action. The extent of this incrustation may be very slight if a hard water passes through the pipes; but when dealing with the soft moorland waters so largely used in the northern counties it is liable to become very serious in reducing the carrying capacity of the pipes.

It is therefore the general practice among water engineers to make an allowance for this future diminished carrying capacity by designing the pipes of such diameter as still to be able to pass the required quantity of water even after incrustation has taken place.

As an illustration of the economic effect of this point it would have been possible to save no less a sum than £60,000 on the pipe line which the author's firm are now carrying out for the Birkenhead Corporation if no loss of carrying capacity in the future were liable to occur.

It is possible to remove this incrustation by mechanical means, but it has not been found possible to restore the coating, with the consequence that the pipe rapidly deteriorates in carrying capacity after scraping, and the operation has to be repeated at comparatively short intervals. Nor can this method be employed beyond a certain limit, or the main would be unduly reduced in strength by the removal of the corroded material and the presenting of a fresh surface for attack.

With regard to steel pipes, the effect of internal corrosion is still more objectionable; not only the loss of carrying capacity, but also the loss of strength has to be allowed for. This is due to the fact that steel can stand high tensile strength, and therefore steel water mains are much thinner than cast-iron mains of the same diameter to stand the same pressure. It has been found that pitting due to corrosion seldom extends to a greater depth than $\frac{1}{8}$ in. As the tensile stress allowable for cast-iron pipe is only 2 tons per square inch as against 6 tons for steel, it follows that the steel pipe will be, theoretically, only one-third the thickness of the cast iron.

Supposing the cast-iron pipe were 1 in. thick, the loss by corrosion of $\frac{1}{8}$ in. will only represent a loss of strength of 12 per cent, whereas the steel pipe, being only $\frac{1}{3}$ in. thick, the loss of $\frac{1}{8}$ in. would decrease its strength by 40 per cent.

It is therefore good practice to allow an extra $\frac{1}{8}$ in. in thickness in the steel pipe to resist unavoidable corrosion.

This means that the economic bearing of corrosion on the use of steel pipes is even of more importance than it is for cast-iron pipes.

Various Theories to Account for Corrosion

It is now proposed to consider briefly various theories which have been put forward to account for the corrosion of iron. The subject is too wide and too technical to do more than glance at some of them.

For many years corrosion was thought to be a simple oxidation, but in 1838 Zumstein proved that the air did not corrode a polished iron cross which had been placed by him on the summit of Monte Rosa in 1820 and examined in 1821. The explanation is that at the low temperature which obtained at this elevation there was an almost complete absence of water vapour.

That dry air will not act on iron at temperatures below 100 deg. Cent. has since been confirmed by many other experiments. In the same way pure water free of all dissolved air is practically inert on iron.

It has been shown that oxygen and water vapour do not corrode iron unless the temperature falls to below the dew-point; but when condensation occurs corrosion becomes active.

This accounts for the fact that iron does not corrode where the conditions are such as to prevent condensation taking place. A good example of this can be seen inside Westminster Abbey, where the tie-bars which were introduced in the fourteenth century to give lateral support to the pillars supporting the roof are still in excellent condition.

Acid Theory of Corrosion.

Having now arrived at the point that water and oxygen are necessary for corrosion, the question presents itself as to whether corrosion is due to these elements alone. According to one theory the presence of an acid is also required, and this is found in the minute traces of carbon dioxide which are present in the atmosphere and in water.

This carbon dioxide combines with the iron to form soluble ferrous carbonate or ferrous hydrogen carbonate. The oxygen of the dissolved air then converts the soluble iron salt into ferric hydroxide which is deposited as rust and liberates carbon dioxide, which is free again to attack the iron; and so the process is repeated until protection may be found by the deposition of rust on the iron. This theory has found much support.

Electrolytic Theory of Corrosion.

Experiments carried out by Whitney and others were formerly held to be conclusive that an acid was not essential for corrosion which would take place if iron were introduced into water containing dissolved oxygen.

The action of alkalies and their inhibitory effect on corrosion had also been demonstrated, and the electrolytic theory put forward by Whitney furnishes an ingenious explanation.

This theory is, briefly, as follows: Water consists of oxygen and hydrogen, one atom of the former being combined with two of the latter. It is assumed that what are termed "ions" also exist both of hydrogen and a group in which oxygen and hydrogen are associated in a form called "hydroxyl." The ions of hydrogen carry a positive electric charge, and the hydroxyl ions a negative charge.

The presence of dissolved oxygen in the water tends to cause the hydrogen ions to combine, but they cannot do so unless they obtain a negative charge. This charge they obtain from the iron, which is then rendered soluble, the iron itself being changed into the ionic state and entering the water. Finding in the water hydroxyl ions, the iron ions combine with them, forming ferric hydroxide, or rust, which is deposited on the iron.

It will thus be seen that the electrolytic theory assumes that no acid is necessary for corrosion to take place. The experiments carried out by Friend, however, in which the greatest care was exercised to remove all traces of CO_2, appeared to show that corrosion did not take place when iron was introduced into water containing dissolved oxygen or air alone.

This point is one of great interest, but is still con-

* Paper read before the Institute of Sanitary Engineers, at Caxton Hall, Westminster, on April 14th, Mr. A. P. I. Cotterill, president, in the chair.

[illegible] on all, though the balance of opinion seems to be in favour of the electrolytic theory.

BIOLOGICAL THEORY.

The biological theory of corrosion, where the attack is attributed to the action of organisms, was put forward as a possible explanation of some of the conditions which prevented corrosion taking place, seeing that these conditions were also such as would destroy life. It can be shown, however, that corrosion does take place under conditions which would inhibit life, and we have therefore to look elsewhere for the true explanation.

Although corrosion takes place where no biological explanation is possible, organisms often play a most important part in accelerating corrosion, and the probable explanation is to be found in the action of their [illegible] excretions.

Internal corrosion of water mains is accompanied by the deposition of encrustations of a limpet-like form, the upstream face of the limpet being steeper than the downstream face. They rarely form to a greater height than 1¼ in. in large mains, and contain sulphur in larger quantities than could have been derived from the iron of the pipe. Sometimes organisms of a rosary or double spiral form are present, but not always. The limpets are hard without and soft within, and are composed of concentric layers of ferric oxide, the outer layers being sometimes black magnetic oxide. The iron below the limpets is invariably pitted by corrosion.

EFFECT OF DISSOLVED OXYGEN.

Whether the electrolytic or the acid theory be correct, the presence of dissolved oxygen in the water is essential before corrosion takes place. The question naturally presents itself as to whether comparative immunity from attacks could be brought about by the partial removal of the dissolved oxygen from the water.

The author's firm were consulted by the Western Australian Government with regard to the partial failure of the 30-in. pumping main between the Mundaring reservoir and Kalgoorlie, a distance of 350 miles, brought about by internal and external corrosion. They had the advantage of being associated with Sir William Ramsay and Mr. Otto Hehner, and it was the author's privilege to assist these gentlemen in the experiments which were carried out at University College to determine the best means of safeguarding the life of the main in the future. It was not very long before it became evident that the air dissolved in the water was essential for the internal corrosion to take place.

The first series of experiments showed that by partial removal of the dissolved oxygen the activity of corrosion was greatly reduced. Experiments were then carried out to ascertain whether any practical apparatus could be designed for removing the dissolved air, and so reducing the activity of corrosion. The water was allowed to enter a vacuum chamber as a fine spray, and the conclusion which was drawn from the results of the experiments was that the dissolved gases were rapidly removed, very little further advantage being obtained by allowing the water to remain for a long period in the vacuum chamber.

It was therefore possible to devise an apparatus which was capable of passing a very large quantity of water in the form of a fine spray into a chamber from which the gases disengaged were removed by an air pump, and by this means the corrosive activity of the water was enormously decreased.

It is fairly obvious that if corrosion is largely due to the presence of dissolved oxygen in the water, there should be a marked difference in the activity of corrosion in a pipe where a considerable flow takes place, seeing that in the case of still water the dissolved oxygen would tend to become used up, whereas in this case fresh oxygen would be brought along by the water, and the attack would therefore be continually renewed.

It has been found that if a system of distributing mains which have been in use for a long time be examined, the dead ends, where little water circulates, are less corroded than those pipes through which a comparatively large volume passes.

Although it is true that at low velocities the corrosion increases with the velocity of flow, a point is reached when the opposite takes place, and there is a critical velocity at which corrosion reaches a maximum. Messrs. Heyn & Bauer found that with cast-iron the amount of corrosion increased with the velocity of flow until the amount reached eight times that in still water, and that beyond this up to six times the critical velocity the amount of corrosion for a corresponding period remained the same. The corrosion in still water in the case of steel was 1·6 times that of cast iron, but increased less with velocity of flow than it did that of cast iron, so that at a certain velocity the corrosion was less than half that of cast iron, and only a little more than double the rate of steel in still water. Strangely enough, further increase in velocity only reduced the rate of corrosion. The difference in the behaviour of the two metals is interesting, but the explanation is not apparent.

EFFECT OF SEWAGE CONTAMINATION.

It follows from what has been said with regard to this action of the dissolved oxygen that if an impure water is so contaminated with sewage that the free oxygen is used up in the oxidation of organic matter, it should be found that iron does not corrode so rapidly in such contaminated water as it would in pure water, provided that there were no deleterious acid present.

When the London main drainage system was constructed considerable use was made of cast iron to form the intersections of the lining of large confluent sewers. Although these cast-iron plates have been immersed in sewage for over fifty years, they show little sign of corrosion.

The presence of chlorides in the water tends to accelerate corrosion, and from that point of view sewage should be more actively corrosive than fresh water, but the action of the chlorides is dependent on the amount of oxygen present, and the activity of attack is therefore restricted.

Ordinary grease tends to protect the iron by adhering to it, and thus preventing attacks.

Generally speaking, if acids are absent it will be found that iron lasts very well when immersed in sewage.

EFFECT OF SOFT MOORLAND WATERS.

Soft moorland waters are particularly liable to corrode iron pipes. This was formerly attributed to the fact that many of these waters are slightly acid, but corrosion has been found to take place with neutral, and even slightly alkaline, waters.

Hard waters are generally found to be very slightly corrosive, probably due to the deposit in the interior of the pipe of insoluble carbonate of lime brought about by the CO_2 dissolved in the water.

The London water mains are a good example of the protective action of a hard water.

EFFECT OF ALKALIES IN REDUCING CORROSION.

The effect of the addition of alkaline solutions to a corrosive water, such as that from the Mundaring reservoir, which supplies the Australian goldfields, is very well marked. It was found that when 3 grains of caustic soda per gallon had been added the loss by corrosion was reduced to one-thirteenth of that caused by the untreated water. In the report already alluded to this was one of the two protective methods recommended to the Western Australian Government.

The explanation of this action is readily given by the electrolytic theory, seeing that the addition of the alkali would give rise to hydroxyl ions, which would lessen the number of hydrogen ions present, and would therefore tend to arrest corrosion, as it is the hydrogen ions which are responsible directly for the attack on the iron.

EFFECT OF CERTAIN EXTERNAL CONDITIONS IN INCREASING THE TENDENCY TO CORROSION.

Having dealt with some features which modify the corrosive attack on the inside of the main, we have now to consider the external conditions which have been found to lead to rapid corrosion.

External corrosion is very largely dependent on the presence of water, especially if the water be saline. It is well known that sea water is more active in its attacks on cast iron and steel than fresh water. The corrosive activity of salt water is accelerated by the presence of dissolved oxygen, but it can take place even where little or none is present.

The chief salts present in sea water are sodium chloride, magnesium chloride, and magnesium sulphate. All the salts are capable of corroding iron, but whereas the corrosion is arrested in the case of sodium chloride and magnesium sulphate when dissolved air is absent, the attack of magnesium chloride is not dependent on the presence of air. When sea water attacks cast iron the iron disappears to a large extent, leaving the graphite. Probably soluble ferrous chloride is formed, which is washed away, leaving ferrous oxide, carbon, silica, &c.

An analysis made of such altered material showed

that it consisted of 81 per cent of ferrous oxide and 16 per cent of carbon. The specific gravity was only about one-sixth of that of iron. The form was retained, but the material was, of course, quite soft until exposed to the air, when it hardened.

As far back as 1853, Mr. Thomas Duncan described how the cast-iron mains laid at Liverpool deteriorated rapidly in the neighbourhood of the docks where the soil was impregnated with salt. He also noted that the harder qualities of cast-iron did not deteriorate to the same extent as the softer. A considerable number of similar deteriorations have been noted, especially in America.

Ashes and cinders have been found to be particularly destructive to pipes, especially where water is present. This is no doubt due to galvanic action, the iron being "anodic" to the carbon, and will be referred to in more detail later. Clay containing gypsum (calcium sulphate) is also actively corrosive in the presence of water.

A very complete study of the corrosion of cast-iron mains in America has been undertaken by Mr. Marshall R. Pugh, who contributed a paper on the subject to the American Society of Civil Engineers in October, 1914. He deals with a number of cases, and shows how the corrosion of the pipes is dependent not only on salt water, but also on the conditions which influence the amount of dissolved air present in the water, the attacks being most active where conditions favour the presence of dissolved oxygen. Analyses were made of the soil of the salt marshes in the neighbourhood of the pipe at Atlantic City, which showed that the iron of the pipe had been dissolved as ferrous chloride, and had been diffused and deposited as ferrous oxide in the surrounding soil.

Relative Corrodibility of Cast Iron, Wrought Iron and Steel.

Having dealt with the conditions affecting corrosion, the question of the relative corrodibility of wrought iron, steel, and cast iron have now to be considered.

The view is generally held that wrought iron is less corrodible than steel. Pure iron is very slightly corrodible, no doubt owing to the fact that the absence of impurities prevents the setting up of galvanic action. Pure iron is, however, not obtainable commercially.

The experiments which have been carried out, and the statistics which have been collected on the relative corrodibility of the two metals as at present manufactured, are far from being conclusive, though many ancient monuments and relics in wrought iron still in a good state of preservation indicate that the wrought iron of those days was decidedly superior to the modern commercial material.

The iron pillar at Delhi is one of the most interesting relics of ancient India, and is said to date back from the year 912 B.C. This pillar, 50 ft. in height and about 16 in. in diameter, is built up of blooms, weighing about 50 lb. each, welded together. The pillar is remarkably free from rust, though the climate of Delhi is not particularly favourable for the preservation of iron exposed to the atmosphere. The surface of the iron has a bronze-like appearance, and one of the suggestions which has been put forward to account for its remarkable state of preservation is that the iron was forged on a silicious stone anvil, and that some of the silica of the stone entered into combination with the iron, as it is known that silica has a marked influence in resisting corrosion when alloyed with iron.

With regard to the relative merits of cast iron and steel in resisting corrosion, Thwaites' experiments, which are recorded in the Journal of the Iron and Steel Institute, are of great interest. It has long been considered that the relative immunity to corrosion of cast iron was largely due to the foundry skin formed at the point of contact between the molten metal and the silicious sand of the mould. Thwaites therefore tried wrought iron, cast iron, and cast iron when the skin had been removed by planing, and immersed plates of each in foul sea water, clear sea water, foul river water, pure air, and clear river water, and also exposed them to the action of city air and sea air. It may be said that in every case cast iron with the skin intact resisted corrosion much better than either wrought iron or cast iron with the skin removed.

The evidence of experimental investigations is therefore in favour of the generally accepted view that cast iron resists corrosion better than steel, and that this is largely due to the silicious foundry skin affording a certain measure of protection.

Effect of the Chemical Composition of the Iron, and its Influence on Corrosion.

It will now be of interest to consider the effect on corrodibility of the various other elements which exist in commercial steel in combination with iron. Unfortunately, the work carried out in this field is rather incomplete. This is especially the case with regard to carbon, but it appears that it is not the percentage of carbon present in the iron which is important, but the actual molecular arrangement of the carbon.

Carbon appears as graphite, which, again, exists in two forms—either flakes, which separate out at a high temperature, or in a state of fine division. The presence of the flakes of graphite have undoubtedly an influence on corrosion, as they are electro negative to the iron itself; but with this point we are not at present concerned. Carbon also occurs as carbide, or combined carbon, in forms which have been given various names. "Martensite" is the name given to the carbide as it exists in hard steel, and "Perlite" to the form which exists in annealed steel.

Some very interesting experiments have been carried out on the effect of the temperature to which the steel has been raised after quenching on its solubility in dilute sulphuric acid.

A most curious result was obtained which points to the probable existence of another form of carbide, to which the name of "Osmondite" has been given, and which has the property of rendering steel extremely liable to attacks by dilute sulphuric acid. There was very little difference up to an annealing temperature of about 200 deg. Cent., when the carbide was evidently still in the form of "Martinsite." From 200 deg. to 400 deg. annealing temperature the carbide probably gradually changed from "Martensite" to "Osmondite," and for steel annealed to the latter temperature the corrosion in the acid was six times as rapid as for steel annealed to the former temperature.

As the annealing temperature rose still further the corrodibility of the steel became less and less, the carbide passing from the form of "Osmondite" to that of "Perlite," and when the annealing temperature had reached about 700 deg. Cent. the corrodibility of the steel was only about twice as great as for hardened steel, and probably the carbide was almost completely converted into "Perlite" at this temperature, for when the annealing temperature was raised to 900 deg. Cent. very little further change took place. The particular steel experimented with contained 0·95 per cent of carbon.

Experiments were also carried out with mild steel containing 0·07 per cent of carbon, and it is stated by Friend that analogous results were obtained.

The above results are of considerable importance, as will be shown presently when the question of the desirability of annealing to remove strains from the steel is dealt with, and point to the necessity of careful investigations being made of the particular steel to be employed for steel pipes; otherwise the effect of annealing may be to increase the liability to corrosion.

The general conclusion to be drawn from the experiments is that the harder the steel the less liable is it to corrode. Unfortunately, it is not practicable to use hardened steel for the manufacture of pipes, but it would be of great interest to ascertain whether the pipes might not be hardened after manufacture so as to render them less liable to attack.

Welded pipes are now in such general use that a low carbon content is important in order to secure a good welding steel.

From various experiments it would appear that small percentages of chromium and copper are of value in reducing corrosion, though it must be borne in mind that copper may be present in combination with sulphur, in which case it is a most undesirable constituent of steel.

It is important to specify a low manganese content for steel to be employed in water mains, as manganese generally indicates the presence of manganese sulphide, which increases the liability to corrosion.

Nickel has long been known as a valuable adjunct to steel in reducing corrosion, but it is only really effective when present in large quantities, and such a large proportion renders the steel otherwise unsuitable for pipes.

Provided that phosphorus is limited to 1 per cent, its presence in steel for pipes is now considered rather beneficial than otherwise.

Silicon, when alloyed with iron, has a marked preventive action as regards corrosion; if there is 20 per cent present the product is practically incor-

[illegible] while 3 per cent has a marked beneficial effect. Unfortunately, such high percentages render the metal unsuitable for pipes owing to its excessive hardness and brittleness. The silicious skin formed on ordinary cast-iron pipes is probably the explanation of their greater resistance to corrosion. If means could be found to give steel pipes a similar skin an important step towards the solution of the corrosion difficulty would have been made.

The presence of sulphur is always objectionable, as it not only tends to set up galvanic action, but forms sulphuric acid in addition, and it is essential in all cases where the metal is exposed that the sulphur content be kept low.

The effect of chemical composition upon the capacity for resisting corrosion has been briefly dealt with, and it will, perhaps, be of interest to consider how far the process of manufacture affects the corrodibility of metal.

It has long been known that steel which has been subjected to stress is more liable to corrode than unstressed metal, and experiments have been carried out which indicate that the corrodibility is proportional to the stress. It is therefore important to remove the internal stress by careful annealing after manufacture. The temperature to which the pipes are reheated ought only to be decided, however, after careful experiments have been made, because it has been found, as already stated, that there is a critical temperature at which the carbon takes the form of "Osmondite," the presence of which renders the steel extremely liable to corrosion.

ELECTRIC AND GALVANIC ACTION.

In the early days of electric traction considerable damage was brought about by stray currents; but recent Board of Trade regulations afford quite sufficient protection to water mains provided they are kept at least 2 ft. clear of the rails, and that the ground is not impregnated with salt water, in which case it is well to surround the pipes with lime concrete as an additional protection beyond the usual coating mixtures.

Abroad it is well to give the rails a wide berth unless the regulations afford protection equivalent to that given by the Board of Trade at home.

The importance of galvanic action as opposed to that of stray electric currents cannot be too much exaggerated, and when pipes have been destroyed in the manner already described when dealing with the effects of salt water, it is probable that galvanic action has been largely responsible. Most of the elements and compounds associated with iron in either steel, wrought iron or cast iron, including mill scale (oxide of iron) and cinders, are electro-negative to iron—that is to say, in the presence of an electrolyte a current flows from the positive iron to the negative element, and in doing so carries with it ions of iron.

PROTECTIVE MEASURES.

For ordinary cases it has been found that the coating of Dr. Angus Smith's solution is a fairly efficient protection against corrosion. The original mixture consisted of coal tar, tallow, slaked lime, fine resin and coal naphtha, but the mixture used nowadays consists essentially of coal tar and pitch oil in the proportion of 2 to 1 by bulk, and the pipes are dipped in this at nearly boiling temperature after all rust and scale have been removed. There is a possibility that pinhole penetrations caused by air bubbles will impair the coating, and in some instances a second dipping has been specified.

As already pointed out, incrustation is not likely to occur with hard waters, but with moorland waters it is most essential to secure a perfect internal coating, and in the case of the Birkenhead aqueduct, in which all the pipes exceed 18 in. in diameter, an entire recoating of the inside of the pipes with Siderosthen is specified just before the pipes are laid in the trench.

In the special circumstances which give rise to external corrosion, the pipes ought to be carried over the ground. This, of course, is not generally practicable in this country, owing to difficulties arising out of severance of property.

Where cast-iron pipes are laid through marshy ground impregnated with salt water, as on the Birkenhead aqueduct, it has been considered sufficient to serve the pipes with hessian saturated with bitumen as an additional measure of protection. A certain part of this hessian must be left off at the spigot end of the pipes until the joints have been made, and this is made good in the field, as are the many spots in which the wrapping has been damaged in transit.

Hessian wrapping has been generally adopted for the protection of steel pipes, and answers well for small mains, but the difficulties of ensuring an absolutely continuous coating have made it necessary to surround the steel pipes through the salt marshes, previously alluded to, with concrete, except at the flanged joints, which are embedded in a mixture of clay puddle and slaked lime, to facilitate examination of the joints.

Large steel pipes used on certain lengths of the Catskill aqueduct for the supply of New York have been given a 3-in. lining of 2 to 1 Portland cement-mortar, and experiments have shown that even where the mortar has not adhered to the metal the desired protective action has been obtained.

The partial failure of the steel pipe line (previously referred to) supplying the Western Australian goldfields, has been much commented upon, especially by those interested in the sale of cast-iron pipes, and, in spite of many reports on the matter, the facts are not fully known. It is proposed therefore, in concluding this paper, to give a short description of what has taken place, as a practical [illegible] has been laid.

The thickness of the 30-in. diameter lock-jointed steel main varies from ¼ in. to $\frac{5}{16}$ in. in the course of the 350 miles between the Mundaring reservoir and Kalgoorlie. The steel for both the plates and bars [illegible] sample contains 0·173 carbon, 0·035 phosphorus, 0·060 sulphur, 0·432 manganese, and 0·01 silica (per cent).

It is stated that great care was taken to remove mill scale and rust before coating with, for the greater part of the line, a mixture of coal tar and Trinidad asphaltum, and elsewhere with a less efficient compound, "Maltha." Welded steel collars run with lead formed the joints, and the total cost of the pipe line was £2,140,000.

The water is pumped successively through eight pumping stations, but as no balancing tanks were provided at the summits between pumping stations, parts of the main ran partially full, air being drawn in at the air valves, thus setting up a state of affairs extremely likely to promote corrosion.

Pumping tests in January, 1903, showed that the main would deliver 5,600,000 gallons per twenty-four hours with a fall of 2·85 ft. per mile.

The greater part of the main is laid in ground impregnated to a considerable extent with carbonates, sulphates and chlorides of calcium, magnesium and sodium, and before the work was undertaken a commission, consisting of Prof. Unwin, Dr. G. F. Deacon, and Mr. Carruthers, advised that the main should not be laid below ground. It further recommended that the pipe should be dipped twice, which precaution was also omitted.

The water in the main also contained a considerable proportion of salts, of which 25 parts per 100,000 of sodium chloride and 5 parts of magnesium chloride were the most notable.

The first rust hole was found in June, 1905, and up to the end of 1908 the number reached 151, and thenceforward the holes have rapidly increased in number, over 900 having been recorded for the year 1913-14.

The excavation revealed the fact that the pitting occurred when the soil was of a retentive character, so that moisture was present. When it was practicable to leave the pipe exposed, it was simply recoated and supported on timber bearers. When it was found necessary to fill in the trench the pipe was wrapped with tarred hessian.

In 1906 it was observed that the head necessary to pump the water was increasing, due to internal tuberculation, and by the end of 1908, or after about six years, the carrying capacity of the main had fallen off by an amount varying from 13 per cent to 53 per cent for different lengths. It was evident that this was due to the failure of the coating, as when the "Maltha" mixture had been used was just where tuberculation was most pronounced. Some of the pipes had also been distributed alongside the trench many months before they were laid, and this may also have had something to do with it.

The three worst sections were adjacent to each other, and the carrying capacity in these sections had fallen off by amounts varying from 40 per cent to 53 per cent. The "Maltha" mixture had been largely used on these sections, the amount so coated varying from 66 per cent to 75 per cent of each section. The exposure of the pipes before laying on

these particular sections varied from twenty to twenty-four months, which was a longer exposure than for any other portion of the pipe line.

The usual pitting, accompanied by tuberculation, had appeared, but it was found that the pitting was in no case deeper than ¼ in. The tubercules did not project more than about 1½ in., and occurred with greater frequency on the bottom of the pipe.

With regard to external corrosion, we reported in 1909 that, in our opinion, the two factors which had brought about external corrosion were:—

(*a*) The deterioration of the protective coating, and (*b*) the fact that the pipe was laid in trenches when it should have been carried on trestles, so as not to be in contact with the surrounding soil, the soluble salts contained in which give rise to corrosion when moisture is present.

We concurred generally with the remedial measures then being taken, but suggested that where it was necessary to bury the pipes in the ground they should be laid on a cradle of lime concrete, and a layer of slaked lime ½ in. thick should be spread over the top of the pipes.

The recommendations which were made with regard to arresting internal corrosion and tuberculation were as follows:

(1) That measures should be taken to prevent air from entering the mains by the construction of summit level and special receiving tanks.

(2) That an apparatus be established as near the reservoir as possible to de-aërate the water entering the main, and that three grains of lime per gallon be added to the water.

The de-aërating apparatus was fully described and a drawing supplied, together with an estimated cost of dealing with the water, based on actual experiments.

After receiving our report, the Western Australian Government formed a Departmental Committee consisting of certain local engineers and chemists, who were to consider the report and advise the Government thereon. These gentlemen expressed themselves generally in agreement with the recommendations, but stated, "We are of unanimous opinion that the pipe was wisely placed below ground." Although they agreed with the suggestion of protecting the pipe by means of slaked lime when the trench was refilled, this was not done.

They concurred with the view that steps should be taken to keep the main fully charged with water, and agreed with the recommendations for arresting internal tuberculation, but suggested that the lime treatment should first be tried, and if this was not successful that the de-aërating apparatus should be added. The lime treatment was put into operation in October, 1910.

In reference to external corrosion, the second annual report, 1913-14, of the Department of Water Supply, Sewerage and Drainage of the Western Australian Government states (p. 66) that "it will be necessary now to open up the pipes more extensively than hitherto in order to keep them from going beyond repair," which hardly endorses the unanimous views expressed by the local board of experts "that the pipes were wisely placed below ground."

Seeing that the life of this pipe line has been so largely decreased and the annual maintenance so enormously increased, it is not going beyond the mark to put the money thrown away at something like £1,000,000 sterling, for if the Government had taken the advice they were given by the original commission external corrosion would have been negligible.

Turning now to internal corrosion, where the advice given was partially followed it appears that the treatment of the water has been successful and that internal tuberculation has been arrested, the following being quoted from the same annual report:—

"Inspections made lately show that a continuous coating of lime has been formed inside the 30-in. main along the greater part of its length, diminishing gradually in thickness from Mundaring until traces only are found at Kalgoorlie.

"The corrosion and consequent formation of nodules in the main that were going on rapidly a few years ago appear, from the inspection made and from tests of friction in the main, to have been brought almost to rest."

The report contains some interesting photographs showing the interior of the main at different distances from the reservoir, and the effect of the lime treatment.

CORRESPONDENCE.

FLIES AND EXCRETA.

To the Editor of The Surveyor

Sir,—In the Ninth Report of the Sewage Disposal Commission, just published, there is a memorandum by Sir William Ramsay dealing with Conservancy methods.

While differing on many points from the views expressed in that memorandum, there is one view expressed on page 188, lin. 32-33, which is absolutely opposed to the experience of all who have made any study of the habits of flies.

The paragraph I allude to runs as follows: "Flies do not settle on fresh excreta, and the latter should always be buried while fresh."

This statement is most misleading, and should not be allowed to pass uncorrected. It is a matter of common knowledge that very many species of flies, including *Domestica*, *Corvina*, and a host of other species revel in fresh excreta. Graham-Smith, in his book on "Flies and Disease," non-blood-sucking flies (Public Health Series, Cambridge University Press), p. 202-203, 1st edition, quotes Nicoll as follows:

"It is a matter of common observation that fresh and moist fæces attract flies much more readily than old and dried fæces. Flies feed on warm, fresh fæces with considerable avidity, and they will do so even although they have been previously feeding on other material. To flies which have not fed for some time the presence of fresh human fæces acts as an immediate source of attraction, and in some of my experiments the eagerness with which they attacked it was most striking. When the portion of fæces was so small that all the flies could not find standing room upon it, or around it, they struggled together and pushed each other aside, and more than once I have seen them so closely packed together that each fly could find room for only the tip of its proboscis, the flies on top practically 'standing on their heads,' supported by the bodies of those around. Their behaviour towards older fæces, however, is very different. When the material has become cold it does not attract flies nearly so readily. So long as it remains moist it continues to attract, and does so quite as much as moist bread, although very much less so than moist sugar. When it has become dry it possesses little or no attraction, but this is increased when it is moistened again. It is evident, therefore, that the presence of moisture plays an important part in a fly's attitude towards fæces as an article of food. When the alternatives of fresh fæces, sugar and bread were offered, the flies did not confine their attention to any one of these articles, but made repeated excursions from one to the other."

Regarding the re-moistening of dried material for feeding purposes, this is frequently done by certain Reduvoid bugs, who pump out saliva for this express purpose.

Economic entomologists are fairly well agreed that, for the extermination of any insect pest, the pest must be attacked at its source, and, preferably, attacked by a parasite. The day of "washes" and "insecticides" has been relegated to the past. For purposes of diminishing the numbers of flies, the maxim of "Swat that fly" is doubtless a beneficial one, in that it may induce elderly gentlemen to take a certain amount of bodily exercise; supposing, however, that *M. domestica* (the house-fly) does not hibernate, and proof is still lacking both ways, then the killing of individual flies reminds one of the advertisement which, it is said, once appeared, offering a certain way of killing fleas, price 6d., post free. The apparatus consisted of two small blocks of wood, and the instructions were as follows: Place one block on the table, put the flea on this block, place the other block on the flea, and press hard!

If flies are to be attacked in earnest, it is pretty safe to assume that their breeding grounds should receive first attention. There is work in connection with the house-fly alone to last two or three lifetimes, and until the public begin to realise the value of genuine scientific research work, and that the labourer is worthy of his hire, so long will the fly problem remain in very much the same condition as it is to-day.—Yours, &c.,

Thothmes

Replanning and Redevelopment in Existing Areas.*

By W. T. LANCASHIRE, A.M.Inst. City Engineer of Leeds.

old areas of towns, clearing of unhealthy areas, &c.; the Metropolis.

for better travelling facilities, and for the clearance expenditure which is involved in their execution. sideration, and in many instances the opportunities dealt with.

development. New by-laws and powers under Private new estates, and many streets and roads have been whole of these street improvements and widenings have been brought about solely with the idea of furnishing better facilities for traffic. There are a few examples where other considerations had some weight in bringing about the alteration, or have materially affected the plans.

standard for first-class streets in the centre of the city has been 75 ft., which allows for a double line for two lines of vehicular traffic between the rails and the kerbs.

It is not a width which commends itself to shop- street in which to conduct their business; but experience in Leeds shows that it is easy to err on the narrow side in this matter, as several streets have been widened twice, and more than one plot of land has been bought, sold, and bought again for street-widening purposes.

and improvement during the last fifty years has amounted to about 2½ millions of money, and the annual charge for sinking fund and interest is respon-

With the object of preventing the frequent breaking up of street surfaces, subways have already been constructed to a length of about 2,177 yds. to accommodate gas, water, electricity and other mains and services, the largest subway being 8 ft. by 7 ft. In dealing with the unhealthy areas and street improvements, it is found that a considerable factor for consideration in replanning and in the cost of developing the areas is the disturbance of the various services of the city—such as the tramways, sewers, elec- other cables and pipes. These services are affected not only by the widening and alteration of lines of thoroughfares, but frequently by modifications in the levels only.

In carrying out street improvements the corporation has not always been in control of the design of the elevation of the buildings erected on to the widened thoroughfares, but within the condemned areas it is, and in all sales in them it reserves the

Where streets are widened parts only of properties are often acquired, and the owner is at liberty to follow his own ideas in rebuilding.

On the untouched side of a widened street the erection of more appropriate buildings is often long delayed, and when it takes place it is without control by the local authority.

The impression gained from the development of the condemned areas and the infirmary scheme is that in some instances it is better to deal with large areas of slum property, and to construct roads through them, than to adopt the alternative of widening existing roads in thoroughfares.

The cost of street widenings in the centre of large towns is very great, as may be seen figures:—

		Width.			
		From	To		
		Feet.	Feet.	£	£
				1,[illegible]	[illegible]
				[illegible]	[illegible]
				[illegible]	[illegible]
				[illegible]	[illegible]
Roseville-road ...		32		15,927	
Cross Stamford-street ...				[illegible]	[illegible]
		12		31,010	

In the unhealthy areas several miles of new wide streets and widened streets have been or will be secured, which, taken at a moderate estimate, would amount to nearly as much as the whole areas have cost.

It is well worth the consideration of municipalities whether it is not advisable to promote schemes which, though they look large on paper, may cost no more, and will certainly do far more to redeem portions of a city than simple street widenings.

The advantage of freedom in laying out a new street over the tied conditions often encountered in street widening is manifest in the matters of lines and levels.

Generally the work of street widening and rebuilding of old areas is very costly, and when one considers the amount it involves in Leeds—i.e., over 1s. 4d. in the £—on assessable value at the present time, and realises that most of this will continue as a charge on the community for many years, one is bound to recognise that further schemes of this description cannot be largely indulged in for some years to come unless the process of carrying them into execution is gradual.

In 1906 the Leeds Corporation decided to drop their powers for carrying out street widenings affecting nearly 3 miles of streets, as the capital cost was so heavy.

These widenings are all necessary ones, and some properties affected by them have been purchased since the compulsory powers were dropped; but the corporation is, of course, handicapped in conducting negotiations with no power behind it.

The lesson to be drawn from this is that it is inadvisable to obtain special powers to acquire a large amount of property in a limited space of time, and that power should be possessed for acquiring it at the discretion of the local authority.

Many corporations possess powers of varying value for defining building lines in old streets, but the process of widening in this manner is open to objection from the public and owners' point of view, as the powers generally are only operative when rebuilding takes place, and affect only the depth of property adjacent to the street. These powers often have to be supplemented by Provisional Orders to put an end to a long-drawn-out process.

The centres of large growing industrial towns are always changing; house property disappears in one way or another, and gives way to manufacturing or business premises which are erected to the old lines of streets. The difficulty of satisfactorily dealing with this gradual change is considerable under present conditions, and often properties and neighbourhoods are made more costly to deal with when the day comes for a further improvement.

The large towns will continue to cover more ground, and the inhabitants will doubtless require that their cities shall be improved as years roll by.

How is this movement to be controlled?

If replanning is dealt with in detail, in small areas at a time, it is easy to miss important considerations which force themselves forward when one is taking a general and comprehensive survey of the whole question.

It therefore appears desirable that each municipality should have its plan indicating the improvements to be carried out as time, opportunity and money allow; but this would have to be a plan to which many would have access. Can this be done

* From a paper read at a meeting of the Town Planning Institute last Friday.

to-day without encouraging the species of speculation which already exists whenever municipalities are supposed to have projects in view? At present it is to be feared the answer must be in the negative.

The advantage of having a plan for the redevelopment of a city would be great. At the present time improvements are often piecemeal, and projects put forward are sometimes cut down to undesirable limits to suit the immediate financial exigencies; the difficulty of carrying numerous schemes through a changing governing body is much greater than would be the case in inducing a council to adopt some comprehensive scheme which would be worked to without undue haste, and as time and money allowed.

A general scheme can be more satisfactorily prepared by calling in all the advisers who ought to appear in such matters than will be the case if the replanning of a big centre is dealt with on piecemeal lines.

It is not suggested that large alterations should be carried into execution at once; it is inadvisable to have too much in hand at one time, or the appearance of a city suffers by reason of the extent of the alterations which are taking place. Sections of street widenings and improvements should be carried through rapidly when once begun, in order that the wounds in the city may heal as quickly as possible, but it ought to be practicable to have schemes in existence for replanning and redevelopment in existing centres, which the local authority should have power to carry out from time to time in detail as occasions may offer and circumstances permit.

PAPER BY MR. H. V. LANCHESTER, F.R.I.B.A.

In a paper contributed by Mr. H. V. Lanchester, F.R.I.B.A., the author directed his remarks more especially towards the preparation of city improvement schemes, and the general principles on which they are framed rather than to the problems that arise when the decision has been arrived at and the work is put in hand. "Though I am aware," he said, "of the difficulties that are felt to lie in the way of a general comprehensive improvement plan, I must still contend for this as against the more usual method of dealing with improvements in isolated instalments."

City improvement, no less than the work of town planning, in the narrower acceptance of the word, demanded the collection of all available information bearing on the problems, and though this might not in every case extend to the preparation of a complete civic survey, it must necessarily follow the lines laid down for such an undertaking.

Alluding to India, Mr. Lanchester said it would probably be some considerable time before the demand for a definite organisation of industry and commerce became an important factor in the improvement scheme. For that reason other considerations took a prior place, predominant among these being health and traffic. Health was, as they knew, intimately connected with housing conditions, overcrowding, density and state of the buildings, character and drainage of soil, and the general standard in respect to sanitary requirements. In many respects the inhabitants of India were cleanly and methodical in their habits; in others, unfortunately, they were quite the reverse, with most disastrous results. Where an area was densely covered by badly built houses plague spread rapidly; but it was checked by open spaces, good roads, and substantial buildings.

Passing on to the traffic question, Mr. Lanchester said he must refer to two factors that had not hitherto been adequately dealt with. One of these was the lack of regulations for sorting out the fast and slow traffic, and directing them, as far as possible, into distinct lines of route; the other was the investigation as to how far the traffic in a busy street was "internal"—that was to say, from one point to another, and therefore incapable of diversion. Statistics on this basis were not easy to obtain, but a great deal might be done by securing a fair general impression of the manner in which such a street was used. Where it was mainly a shopping street there could be no doubt that much of the traffic was of this kind; consequently it would be well to regard such a street, as far as possible, independently from the general provision of traffic routes. In other respects the needs of traffic were beginning to be well understood.

In some remarks on the arrangement of tramway systems the author complained that too often radiating tram routes terminated at three or four different points, and that even those which ran as through lines from one suburb to another did not connect in the centre with other routes. To his mind the ideal method, which, with the improvement of one or two thoroughfares at most, would be feasible in nearly every city, might be termed the central circuit system. With this a route encircling the centre of the town should be selected, and along this all trams would pass in clockwise direction, so that a single line only was needed. "Each of the two track radial routes joins this tangentially to left and right—the left for cars passing on to the central circuit and the right for those coming off it. Thus all cars pass around this centre ring, which should bring them near the railway station or stations and the more important public offices. At all points on the circuit passengers can change from one route to another, and this is also a recognised line on which all cars may be found."

Mr. Lanchester added that the appropriate length for such a central circuit was from ½ mile to 1 mile; if less than the first it would tend to become congested, and if too long it would unduly increase the car mileage.

DISCUSSION.

Mr. Raymond Unwin occupied the chair at the meeting of the Town Planning Institute at which the foregoing papers were read last Friday night, among those present being Messrs. J. W. Cockrill, borough engineer of Great Yarmouth; E. Willis, engineer and surveyor to the Chiswick Urban District Council; H. E. Stilgoe, city engineer of Birmingham; C. F. Wike, city engineer of Sheffield; J. A. Brodie, city engineer of Liverpool; and J. A. Webb, surveyor to the Hendon Rural District Council.

The discussion was opened by Mr. Cockrill, who, in moving a vote of thanks to the authors, showed how the gradual replanning of portions of the town of Yarmouth had contributed to the health of the inhabitants, and in particular had resulted in a material reduction in infantile mortality.

Mr. Stilgoe, seconding the vote of thanks, said that at the present time Mr. Lancashire's particulars with regard to Leeds were especially interesting, because he had just commenced the work of attempting to deal with the central portion of the city of Birmingham. It was a tremendous work to attempt to replan the centre of an old town of any magnitude. He had found that he derived the greatest help by first of all preparing a skeleton map of the city, showing the great radial roads running right out to the extremities of their area and beyond. It was extraordinary that one had to consider roads [illegible] as 7 and 8 or more miles from the centre in relation to the actual centre itself, but that really was, he believed, the first thing one had to do. Then in deciding what the width those roads should be one had to consider what the future traffic was likely to be—that was to say, what means of public conveyance were to be adopted. What they found was that the old main roads running to the centre of the city had a distinct character of their own, and that in many cases if they attempted to widen them they would be not only entirely destroyed from the shopping point of view, but the disturbance of property would entail heavy claims for compensation. In many instances the actual buildings scarcely compared with what one had to pay for trade disturbances. Therefore they had to consider whether it was not more economical, and not only more economical, but more desirable, to cut out a fresh line altogether: and there was no doubt that in very many cases it was more economical to take a straight line through some of the properties—often quite poor and situated a short distance from the main roads. He noticed that Mr. Lancashire had placed the greatest width of street in these improvements at about 75 ft., but he himself had found considerable difficulty in deciding on a figure. In the outer districts one had not the same difficulty, because the expense was a mere nothing compared with what it was in the central area; and in fixing the width of these streets one must consider whether one was going to provide for tramlines in the centre, or bring their minds to the possibility that in all human probability there would in the future be no tram lines in the streets

at all. They knew that the repair and upkeep of tramways was a consideration that unless the carrying capacity was very great the systems had very great difficulty in paying their way. At any rate the presence of tramways in a street must have a great influence on the question of width. If the streets were to be beautified in the centre, the [illegible] anything over 100 ft. and, as was known, thoroughfares of excessive width were not [illegible] It was the medium sized up to about 80 ft. in width which probably touched the limit for the best shopping facilities. Mr. Lan[illegible] had shown them a very interesting lantern of the tramway circle. He did not know, however, whether he looked forward very hopefully to getting that kind of thing. Unless it was of a fair diameter [illegible] the people. The problem [illegible] was a very big one, but the objections [illegible] in his opinion, greatly [illegible] up in the question of the character of the popular [illegible]

Mr. Bigwood remarked that they had in Mr. Lan[illegible] a gentleman who came from a city [illegible] probably more than any other in England [illegible] way of improving [illegible] Glasgow [illegible] spent as much money, though he was not sure about it. The question of shopping streets had been referred to. In Liverpool there was one thoroughfare which was originally the shopping street of the [illegible] the shopping had now, however, left there to a very large extent and property which a little while back was of considerable value had suffered very considerably in consequence. An increase of value had taken place in another street, no portion of which was less than 70 ft. in width, so that affords [illegible] the fashion to say that the proper thing to do was to keep shopping streets narrow, he thought it would be well to keep an eye on the other side. It had been pointed out by Mr. Lancashire that in several cases widenings and improvements had been called for on account of travelling facilities, and he (the speaker) thought that had been so to a very large extent up to the present time. His view, however, was that they must pay more attention to travelling facilities. Travelling facilities must be [illegible] and whether they were tramways or motor 'buses, if they were not going to provide in their streets for [illegible] which would compete with any other mode of travel they would not be able to run their vehicles at a profit. Fast travel facilities were absolutely important, but immediately one got outside the [illegible] centre of the city one had [illegible] consider the people living on the two sides of the main roads. One had to provide means of recreation for the people close to their houses without forcing them to go long distances to public parks. As to widening public streets two or three times, he was glad to see that other cities had had the same experience as Liverpool. He agreed that 80 ft. was a good width for a street in the centre of a city; but, although they might hesitate to widen beyond that, he regarded that width as being on the minimum side in view of the necessity for providing fast travel. He had heard it said that it was better to provide two narrow streets parallel to each other instead of one wide one, but he did not agree with that; it was more advisable to widen sufficiently, or even more than sufficiently, in one thoroughfare, because by doing that they avoided a fresh set of expenses for disturbances by going in for two widenings. A reference had been made to subways. It would be interesting to know whether at Leeds the revenue obtainable from those warranted the expenditure on them, and whether the money that came in from them was going to pay interest and sinking fund. In many cases they were a convenience, but there were many people who did not hold out a hope that they would pay for themselves. In his own town, where he had constructed stormwater sewers which could easily have been subways, he could not induce the companies to contribute towards the expense of increasing the size. He would like to know whether the control of elevations had been really effective. As to the rate charges, did Mr. Lancashire obtain contributions from the tramways towards the relief of the rates in Leeds? Properly handled, he thought the tramway undertaking might be made to help considerably in the widening and improving of main arteries leading to the centre of a town. In their own case they got about £100,000 a year from the tramways, and, curiously enough, that was, on the average, about the amount they spent per annum on road widenings and improvements. On the point [illegible] by the Manchester was proposing, as the tramway authority—not as the public authority—a scheme for the spending of two millions of money on the improvement of a few of the streets in the central area from the point of view of the tramways alone? That seemed an unusually broad view for the tramway undertaking to adopt, but it was one, he thought, that might be well warranted; it might be a step in the right direction, and one that municipal engineers might induce their tramway authorities to follow. There was a point as to whether it was wise to have a town plan for improvements in the central area. Under present conditions he fancied it was a rather dangerous business to show it. At any rate he was not proposing to divulge whatever preparation had been made for widening main thoroughfares in the centre of the town. In India they had a very useful method of taking control of property required for public purposes which might be very well followed in England if one could be quite sure that the publication of the plans in certain cases would not materially increase the cost; but in the meantime he thought it was somewhat unwise to show the plan. The diagram shown by Mr. Lanchester was interesting in many ways, but he did not think it was desirable to lay down any general rule. In Liverpool they had three parallel lines in the centre of the city, and some of their people thought they could make the traffic take a circle in very much the same way, joining up the railway station, and they were even prepared to run the service at a loss. They could not, however, get the people to leave the ordinary lines and go round about the circle. He did not think it would be possible in the case of Liverpool to make people leave streets which were the natural flow of traffic. He had always found it difficult to transfer traffic from one road to another. The only way in which he had been successful in doing it was to improve the surface of certain streets without saying anything about it. That immediately drew the traffic from the streets which one possibly left in none too good a condition in the particular direction one wanted them to travel, and the result was very satisfactory. But they had had some costly experience in Liverpool in the matter of improvements. One could improve and widen streets, and think one was going to increase the value of property, instead of which they decreased it. If one began to interfere with the trade in a particular area, he would suggest taking Mr. Lancashire's advice—make arrangements for rebuilding as quickly as possible, and get the trade back to it without delay.

The vote of thanks was passed, and the authors of the two papers afterwards replied to the points raised in the course of the discussion.

Mr. LANCASHIRE stated that, although levels were not good, it was hoped eventually to introduce a circular road. The subways referred to by Mr. Brodie did not pay for interest and sinking fund, and they found there was considerable reluctance on the part of certain departments to make use of them. As to contributions by the tramways towards the cost of road improvements, it was not until last August that authority was given for that to be done, and the committee objected very strongly to making any payment. They wanted two or three roads widened for short lengths, however, and after discussion it was decided to contribute. He quite agreed as to the difficulty of transferring traffic from one street to another. They might open out parallel roads in the hope that congested roads would be relieved, but found themselves disappointed. On the matter of the depreciation of the value of property, he was also of opinion that unless things were done quickly they ran the risk of spoiling the trade of a street completely.

Crystal Palace Engineering Society.—The "Wilson Premium" for the best paper read before the society (affiliated to the Society of Engineers) during the present session has been awarded by the council to Mr. Kirpa Ram for his paper on "How to Prepare a Sanitation Scheme." Other papers read during the session were "Reinforced Concrete," by Joti Ram Goel, and "The Science and Practice of Photography," by T. J. Boyer. The premium was presented to Mr. Ram by Sir John Jackson, K.C.V.O., LL.D., F.R.S.E., M.P., ASSOC.INST.C.E., on the occasion of the 127th distribution of certificates of the above school on Thursday, the 15th inst., at which he presided.

Some Observations on the Final Report of the Royal Commission on Sewage Disposal.

By GILBERT J. FOWLER, D.Sc., F.I.C.

As long ago as 1896 the present writer made a number of experiments on the purification of effluents by aeration, and concluded that it was not a practical proposition. Recalling the observations then made, however, the ready granulation of colloidal matter with production of a clear supernatant liquid, it is easy to see that the essential phenomena of what is now known as the "activated sludge process" were all there waiting to be applied. Unfortunately, the obsession that the object of sewage purification was the solution or gasification of all the constituents of sewage dominated the mind, and possibly, therefore, altered the whole development of the sewage disposal problem.

Having thus implicated himself equally with others, and the criticism which it seems useful to make in relation to the labours of the Royal Commission will, it is hoped, be understood as being impersonal and without any other object than to facilitate future progress.

After the seven years' work of the Royal Commission, what is, then, briefly the present position of affairs?

Frankly, may it not be summarised by stating that, at considerable expense and trouble, it is now possible, in the majority of cases, to obtain fairly satisfactory effluents, although not infrequently a nuisance is transferred from the river to the air, where it takes the form, not only of smells, but of flies and other noxious insects. The sludge problem is still unsolved, and there is practically no attempt to deal with the really serious question of the economic loss of nitrogen entailed by the water-carriage system and present methods of purification. At the same time no one would suggest that the strenuous labours of the Royal Commission have been wasted. While one can see now that it would have been better if more time had been given to advanced research and less to the collection of data from all and sundry concerning imperfectly understood processes, yet very much has been done.

The burden of red-tape insistence on land treatment has been lifted, much important information has been disseminated, and a certain number of facts have been securely established. In consequence, works of increased efficiency have been constructed in many places.

The researches on estuaries and rivers are probably the most important work done officially by the scientific staff of the commission. Such work is of the greatest interest and value, and cannot well be done by private individuals.

The material results achieved are, however, of less moment than the experience gained. What, then, has hindered progress in the past, and how may mistakes be avoided in the future?

The bars to progress would seem to be in the first place obsessions of various sorts, scientific, professional and administrative; and, secondly, the striving for standardisation, which eventually becomes another name for stagnation.

It may be of interest to consider these in order. An example of scientific obsession, or perhaps rather unscientific obsession, has already been referred to in the persistent endeavour to purify or liquefy the sludge-producing elements in sewage rather than to find out really what occurred under various conditions, and take measures accordingly.

All true scientific research will be found on analysis to consist essentially in removing certain preconceptions from the mind by way of observation, reason and experiment. The faculty for research, while no doubt varying in different individuals, is capable of acquisition by any industrious and honest-minded worker.

One reason why greater advance has not been made in the scientific understanding of sewage disposal is that little attention has been given in our universities and technical schools to scientific research in this direction. In the past at any rate, sewage disposal has been looked upon as largely a matter for engineers, manufacturers and members of district councils, to all of whom the community is greatly indebted, but it is a pity that so much good work has in many cases been based on insecure scientific foundations.

The method of trial and error, beloved by this country in most of its undertakings, no doubt leads to excellent results eventually, but at extravagant cost of time and money.

Among professional obsessions may be noted the apparent difficulty in establishing a right conception of the respective functions of the biochemist and the engineer in relation to the sewage disposal problem.

Both the general public and also some members of the respective professions concerned still fail to realise that the ability to make a few analyses and interpret analytical figures does not constitute an individual as chemist, any more than an engineer is anyone who can make a fair scale drawing, put up a machine, or lay down a little concrete.

A chemist is one who, through training and experience, is able to think chemically and unravel and control the chemical factors of a situation. The qualifications of a chemist competent to deal with sewage disposal problems have to be exceedingly wide if, indeed, it may not be necessary at times to call in the assistance of the biologist, using this term in the broadest sense.

The qualifications of an engineer it may be wise to leave to a member of that profession to define, but the power of readily adapting means to ends is surely among them.

In the mutual respect and understanding and loyal co-operation of these two great professions lies the hope of future progress, not only in the field of sewage purification, but in the vast possibilities of chemical industry.

The administrative obsession is one which needs careful watching to avoid uncorrelated individual effort on the one hand and cast-iron bureaucracy on the other.

When urging, ten years ago, a department of research, the answer given was that it was contrary to the genius of the English people. However, the Royal Commission do recommend the formation of a central authority, part of whose function would be investigation. It is to be earnestly hoped that, in some form or other, this proposal will be carried out.

There are many important inquiries which involve considerable expenditure, and which cannot easily, if at all, be undertaken by individuals or municipalities. The study of rivers and estuaries already referred to is such a matter, and large and extended investigations of the possibilities of sludge utilisation, either for agriculture or otherwise, can best be dealt with by such a central body supported by the Government. Such a department might very helpfully publish periodical reports, giving an account, not only of their own work, but summarising important investigations at home and abroad, so that all those interested in the subject would be kept in touch with new developments.

Similar work is already done, in its own sphere, by the Board of Agriculture and Fisheries.

The very interesting section of the Ninth Report of the Royal Commission dealing with the disposal of liquid and solid domestic refuse in rural areas offers an illustration of the dangers of all three obsessions which have been referred to. Statistics show the benefit of the water-carriage system to large towns: therefore, it is assumed, it must be better for country districts. The water and sewage engineer forgets that under certain circumstances apparently primitive methods may be really as scientific as expensive modern equipment, while equally sanitary and much more economical from the point of view of agriculture. Sundry by-laws, local and Governmental, discourage effort on the part of the individual and the local community.

The central authority should be able sympathetically to consider the cases of many of these rural areas strictly on their merits.

The question of standardisation is another form of obsession which, indeed, is to be found not only in the field of sewage disposal, but throughout British industry and commerce.

The Surveyor
And Municipal and County Engineer.

standards. But to all those who have practically to some time ago to the Association of Municipal Corporations on this matter. We must recognise that in practice we have to deal, as it were, with a continuous curve, and to take half-a-dozen points on it for our standards is a very crude approximation to the facts of the situation.

The only real standard is complete purification without nuisance and with full regard to economy. To commission suggest for their standards, is like allowing the milkman, under stress of circumstances, to continue that permission when the necessity for it

The suggestion of Dr. Wilson, of the West Riding Rivers Board, that every town and manufacturer should adopt the "best practical and available means" for purifying their sewage or effluent would meet the case fully, provided there were an unbiassed authority to state what such means were.

trouble. The Local Government Board issues so-called regulations based on the commission's findings; the engineer who designs the works and the inspector who passes the designs, both are saved trouble. The manufacturer of appliances such as sewage sprinklers, &c., knows what is called for, and finds a market accordingly, and all seems to go well; but eventually all these short cuts and methods for evading the necessity of original thinking stultify progress, and when new conditions have to be faced, a dead weight of inertia of various kinds is built up.

This article has to do primarily with the question of sewage disposal, but the writer's conclusions, he believes, have a bearing on wider issues affecting the national life.

It is being more and more clearly recognised that in many directions there is call for greater efficiency and scientific knowledge. In the field of sewage disposal this country has so far taken an honourable and leading position. Let us beware of settling down to the comfortable belief that the Royal Commission has reported, and all is now well.

Wearmouth Bridge Improvement.—The Committee of the House of Lords have decided that the Wearmouth Bridge Improvement Bill, promoted by the Sunderland Corporation, shall proceed, with certain modifications.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Binnie read at their meeting on the 14th inst.? Was not the paper a thoroughly learned and, at the same time, practical exposition of some of the causes of this besetting evil to iron and steel pipes, and as to the remedies which might be applied?

* * *

Was it not also rather interesting to hear that eminent chemist Dr. Bertram Blount, in the discussion which followed, render a tribute to the courage of engineers and others for employing such perishable articles as iron and steel in constructive work? When he stated that from the moment of manufacture these materials began to deteriorate and perish, did he realise that this is the case apparently with everything in Nature? Who was it who stated that "directly a man is born into the world he begins to die"? And is this not a fact?

* * *

Was the council of the Institution of Civil Engineers awakened to their responsibilities with regard to the charges to be made for professional services rendered by their members by the action of the Association of Consulting Engineers, who have recently dealt with this matter, or was it a mere coincidence? Would not all members of the engineering profession, whether members or not of the Institution of Civil Engineers, welcome a few more "activities" on the part of the council of that body?

* * *

When irresponsible people grumble at the state of some of our roads, which lately have suffered from abnormal weather conditions and extraordinary traffic due to military operations, do they reflect that the roads would have been in a much worse condition if they had been used for military operations by an invading enemy? Should not everyone in this country, instead of spending their time grumbling, do their level best to bring the war to a close by defeating our enemies as speedily as possible?

* * *

Apropos of the above, are there not many engineers over the military age who could join the engineering unit of the National Guard, which has recently been formed, and thus give practical and real assistance to their country?

* * *

Is it a fact that the Roads Improvement Association is considering the question of changing its name to that of "The Roads and Road Traffic Association"? And does it not seem a pity that this well-established body should seek thus to hide its identity after an existence of nearly thirty years?

* * *

Does not the appearance of the huge, unwieldy tramcar in the middle of the ordinary traffic of a crowded street make one wonder as to what would be the effect of an ironclad battleship at Henley Regatta, or an elephant at the Derby?

* * *

Why was it that the Royal Commission on Sewage Disposal did not utterly condemn the dry "interception" processes for dealing with sewage? What could they have been thinking of when it is known that flies are such a serious source of danger, and that any of the disgusting dry systems are not only crude, but a menace to health? Why was not Dr. Boobyer, the medical officer of health of Nottingham, consulted before the report was issued, as he has always something to say in his annual reports condemnatory of the dry systems?

Refuse Removal Difficulties in London.—At Camberwell Borough Council on Wednesday it was reported that the Local Government Board had replied with regard to the council's recent complaint as to the difficulties experienced in conveying refuse out of the borough. The board stated that they had made inquiry at the offices of the Railway Management Committee and suggested that if there is at any time urgent need of railway trucks for the removal of refuse the council should themselves communicate with the committee, addressing the letter to the secretary, 35 Parliament-street, S.W.

Law Notes.

Edited by J. B. Reignier Conder, 57 Moorgate-street, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer, and questions are limited to the practice of engineers and surveyors in local authorities' Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor, at the office of The Surveyor, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion queriers are requested to use distinctive words as noms de plume. The letter X., combinations such as X Y Z., and words such as "engineer" and "surveyor," should never be used.

Water Supply—Recovery of Water-rates.—"W. J." writes: The water supply in this town is under the control of the corporation, the waterworks being their property. All water rates are collected on behalf of the corporation, the charges being based on a scale laid down by them. The charge for domestic purposes varies with the assessment. A short time ago it was found necessary to revise the whole system of collection, and it was found that many people were considerably in arrears. My council are now considering the question of these arrears, and have practically decided to sue for them if not paid by a certain date. I have learnt that it may be contended that these charges are a rent and not a rate, and therefore the council cannot sue unless they can produce a proper agreement. I understand that this contention is based on legal advice. The points I should like to raise are as follows: (1) Can a charge of this kind, vary as it does, according to assessment, be regarded as a rent? (2) What is the difference between a rent and a rate in this connection? (3) Has the fact that on all printed matter the words "water-rate" are used any bearing on the matter? (4) Under what circumstances would it be necessary to have an agreement for a supply for domestic purposes only?

1 and 2. Sec. 26 of the Public Health Act, 1875, empowers a local authority who supply water to do two things, viz.: (1) To charge a water rate assessed on the net annual value of the premises; and (2) to enter into agreements with consumers for the supply of water on special terms, with the same powers for recovering "water rents or other payments accruing under such agreements" as they have for recovering water rates. The Act uses the term "water rents" for the charges payable under such agreements in distinction to "water rates" chargeable without any agreement. It is clear that rates can be recovered without an agreement, and that they are not rents. Rates are recoverable under sec. 74 of the Waterworks Clauses Act, 1847, and sec. 23 of the Waterworks Clauses Act, 1863. The suggested contention is therefore groundless. 3. This does not appear to be material. 4. Only in the case of a supply by meter or on special terms.

"Notice in Writing."—"E. M." writes: I shall be glad if you will say whether the following, put on a plan by means of a rubber stamp, is sufficient "notice in writing" within the meaning of sec. 15 of the Public Health Acts Amendment Act, 1907:—

> NOTE.—THE DEPOSIT OF THIS PLAN IS OF NO EFFECT UNLESS THE WORK TO WHICH IT RELATES IS COMMENCED WITHIN THREE YEARS FROM THE ABOVE DATE OF APPROVAL.

Yes. By sec. 20 of the Interpretation Act, 1889, in every Act expressions referring to writing (unless the contrary intention appears) are to be construed as including references to printing, lithography, photography, and other modes of representing or reproducing words in a visible form.

Construction of New Street.—"Seaside" writes: An owner of land submits plans for a new street which are duly approved by the borough council, and proceeds to lay out the street. He, however, omits to construct the street as required by the by-laws relating to new streets, only laying a sewer and putting down a 12-in. by 6-in. kerb on one side of the street only. He proceeds to sell off all the plots of land fronting the new street, and these are now practically all built upon. He informs me in writing that the street is now completed, but that, having sold all the plots, he has no further concern in it. I have duly notified him, in accordance with By-law No. 101, of his omissions, which I have required him to execute within a month. In the probable event of his making default in compliance, what powers can my council exercise against him to compel the completion of the construction of the street as shown on the approved plans?

This is rather a difficult question, for the following reasons. The "laying out" of a new street and the "construction" of a new street are treated in the by-laws as two separate and distinct operations, and there does not appear to be any by-law making it compulsory for the person who lays out a new street to "construct" the street also. Therefore it would appear that unless this owner has "constructed" the street, he is not bound to comply with the requirements as to construction, and the question is whether what he has done to the street amounts to "constructing" it, so as to bring him within the by-laws as to constructing, notwithstanding the fact that the construction is incomplete. I can find no case or authority throwing any light upon the subject, and I think it is doubtful, in the circumstances, whether the council would succeed in establishing a contravention of the by-laws. If they decide to test the question they can take proceedings to recover penalties (on the expiration of the notices, or, on obtaining the concurrence of the Attorney-General, they can bring an action in the High Court for an injunction to enforce compliance with the by-laws.

TAR-SPRAYING IN NUNEATON.

In his annual report the borough engineer, Mr. E. C. Cook, Assoc.M.Inst.C.E., states that the length of roads tar-sprayed in Nuneaton during 1914 was nearly 18 miles, as compared with 14¼ miles in the previous year and 11⅞ miles in 1912. In addition, nearly 3 miles were sprayed a second time. The total expenditure on tar-spraying (allowing 5 per cent for supervision and plant) was £1,093, and the cost worked out at 1·01d. per square yard, against 1·08d. in 1913, and ·97d. in each of the two previous years.

Mr. Cook mentions that up to the present crude tar has been entirely relied upon; but a contract has now been entered into with the gas company by which they have undertaken to put down a dehydrating plant conditionally upon the council agreeing to purchase a minimum quantity of 300 tons per annum, at a specified price. The arrangement is regarded as a favourable one, from the point of view of the corporation, and is expected to give improved results in working.

Waterproofing of Concrete.—On the flat roofs for the factories of a large glass manufacturer at Rotherham the architect specified a waterproofed concrete as a finishing coat. We understand that the work is very satisfactory. The makers of the waterproofing powder Pudlo, which was used for this work, state that some very important contracts are being roofed with waterproofed concrete.

Motor Lorries and Road Repairs.—Asked in the House of Commons on Tuesday whether, having regard to the damage done to public roads by motor lorries, he would, in the forthcoming Budget, increase the tax on these vehicles in order that the owners should thereby make a more equitable contribution towards the repair of the damage than is at present the case, Mr. Lloyd George said he feared he was unable to anticipate his Financial Statement.

The Treasury and Road Grants.—The following resolution was, on the proposition of the Earl of St. Aldwyn, passed unanimously by the Gloucestershire County Council on Monday last: "That this council protests against the requirements of the Treasury that the Road Board should make it a condition of a grant towards the improvement of certain roads that they should be satisfied as to the adequate maintenance of other roads towards which they have made no grants. That the Road Board grant of 1915-16 towards the scheme previously sanctioned by the Road Board for the use of improved materials upon the more important main roads in the county ought not to be largely reduced in order to relieve Parliamentary votes for war purposes at the cost of the road improvement fund from the charge of repairing roads destroyed by military traffic."

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, 31 Bride's House, 24 Bride lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The following [illegible] have been chosen [illegible] in respect of the March premium:

Mr. BERNARD KNIGHT, Newport, Mon.—Merriman and Brook's "Text-book on Roofs and Bridges," Part III., Bridge Design (Chapman & Hall).

Mr. M. F. ROBERTS, Rhyl.—"Structural Essentials," E. A. Sealy; "Bridges," Prec. Langford; "Calculations in Hydraulic Engineering," Part II., Claxton Fidler (Longmans).

QUESTIONS.

This week answers are invited to the following questions:—

471. Building Construction.—What is a "chase"? Explain its function, and give sketches in elevation and section. (M. T. R., *Rhyl.*)

473. Retaining Wall. Explain carefully the different ways in which a concrete retaining wall may fail, and state how such failures can be prevented. (M. T. R., *Rhyl.*)

474. Roof Truss. What one end of a [illegible] truss is supported on a roller bearing, what provision is made to counteract the movement and to prevent damage to the slates and timber? How would any movement of the truss affect the covering? How much will a 50-ft. span roof [illegible] movement? ("Square.")

475. Hydraulics.—A pipe 5 in. in diameter delivers a certain quantity of water per minute with a loss of head of 4 ft. Determine the loss of head if the same quantity is delivered through a pipe 4 in. and another 6 in. using the same coefficient of friction.

476. Vectors. State the essential properties of vector quantities, and distinguish between "vectors" and "scalars," giving two examples of each.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

466. Road Making. Describe a few simple tests that will enable an engineer to ascertain the quality of the bitumen and filler to be used in a bituminous macadam road. (Essex.)

The following reply is based on Chapter III. of Mr. J. Walker Smith's work on "Dustless Road Tar-macadam":—

The properties of the matrix of a bituminous macadam road which should be known are volatility, viscosity, power of adhesion to aggregate, and specific gravity. To these must be added the determination of free carbon and the amount of distillate at various temperatures.

(1) *Volatility.*—Samples should be taken and placed, in layers of $\frac{3}{8}$ in. in thickness, and not more, into open dishes and exposed to a temperature of 60 deg. Fahr. for one week, when the percentage of loss by volatilisation should be ascertained, and should not exceed 1½ per cent for a "heavy" or 2 per cent for a "moderate" tar. The residue from this test should then be exposed to a temperature of 110 deg. Fahr. for one week, and the loss again recorded. This should not exceed 3½ per cent for a "heavy" or 8 per cent for a "moderate" tar.

(2) *Viscosity.*—Samples should be taken and put into small tins about 2½ in. diameter by 1½ in. deep. These should then be placed in water contained in a tin tray about 14 in. by 14 in. by 2 in. deep, the water being heated by means of a Bunsen burner. To prevent uneven heating the burner should be kept continually moving over the entire area of the tray bottom, and the water continually stirred. Water lost by evaporation should be constantly replenished, so that the same level is retained in the tray. Observations are then taken at temperatures of 62 deg., 78 deg., 90 deg., 110 deg. and 150 deg. Fahr. A [illegible] temperatures a circular copper disc, 1 in. in diameter and 5·715 grammes in weight, is laid flat upon the surface of the tar and the time required for the complete covering of the disc by the tar is recorded. For [illegible] 110 deg. to [illegible] [illegible] [illegible]

also by the size of the perforations. These vary according to the length of the pipe. They might commence with ⅛-in. diameter and extend up to ¼-in. The number and size of the holes are worked out mechanically in accordance with the number of gallons we want to distribute per square yard, based on the maximum quantity required upon any given yard, and whether that yard is close to the centre or at the extremity of the pipe the distribution per square yard is equal."

Further information may be found in the book above referred to, or in vol. 2 of Moore and Silcock's "Sanitary Engineering."

The following was the method used in the original calculations for distributor arms, for the parties who exploited the invention of Mr. Thos. Cairnk, the city engineer of Worcester:—

Single sprinkler arm, 50 ft. long, to distribute 500 gallons per square yard per twenty-four hours with effective head of 6 in.

Area of bed = ·7854 × 100² = 7854 sq. ft. = 872·66 sq. yds.

∴ Quantity to be distributed = 436,333 galls. per 24 hrs.

5·05 galls per second = ·808 cub. ft. per second

Velocity of flow = 8·025 × $\sqrt{H}$ = 8·025 × $\sqrt{\frac{1}{2}}$ = 5·7 ft. per second

Allowing coefficient of ·62 for flow through jet hole actual velocity = ·62 × 5·7 = 3·5 ft. per second

$$Q = VA$$

$$\therefore \cdot 808 = 3{\cdot}5\ A$$

$$\therefore \text{Total area of holes} = \frac{\cdot 808}{3{\cdot}5} \text{ sq. ft.} = \cdot 231 = 33{\cdot}26 \text{ sq. in.}$$

Allowing an equal spacing of 6 in. apart, the number of holes would be 100.

If the area of the first hole is found, the second hole would be double that area, the third hole treble, and so on, in order to give equal distribution with equal spacing.

The total area of holes is therefore the sum of an arithmetical progression having the area of the first hole as both the first number of the series as also the common difference—*i.e.*, $a = d$ in equation.

$$s = \frac{n}{2}\left\{2a + (n-1)d\right\}$$

$$\therefore 33{\cdot}26 = \frac{100}{2}\left\{2a + 99a\right\} = 55 \cdot 101a$$

$$\therefore a = \frac{33{\cdot}26}{55 \cdot 101} = \cdot 0066 \text{ sq. in.}$$

The following table therefore gives particulars of the holes:

No. of hole	Area of hole in square inches.	Diameter of hole in inches.
1st	·0066	·9
2nd	·0132	·13
3rd	·0198	·16
4th	·0264	·18
24th	·132	·41
50th	·33	·65
100th	·66	·92

In practice there may be two or four arms, and the pitch as well as the size of holes usually varies, but proper distribution to the required amount can be calculated on the above principle.

In the earlier forms of the Candy-Cairnk sprinklers the equal distribution was obtained, as above explained, by varying the size of the jets and maintaining equal spacings between them, the areas of the jets varying directly as their distances from the centre of the sprinkler—that is, directly as their lineal speed of revolution.

But in the most recent forms of these sprinklers the equal distribution is secured by the more convenient method of preserving the same size of jets and varying their distances apart.

The spaces separating the jets vary inversely as their distances from the centre.

This method is rendered practicable by the application to the sprinklers of patent spreading jets which deliver the liquid in a wide spray, covering the entire area between the spaces, and not in single isolated streams as is the case from the ordinary jet.

Shanghai Municipal Buildings.—At a meeting of [illegible] March 22nd, it was unanimously decided to adopt natural stone facing for the new municipal buildings. The original contract was for artificial stone. The extra cost will amount to £32,000.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Clacton T.C. (April 13th. Mr. P. M. Crosthwaite). £10,450 for works of sea defence and electricity. Evidence was given as to the necessity for both of the proposed schemes.
